ANGLING AUTHORITIES.—To the foregoing general remarks upon angling, we may add a recommendation of works which will initiate the angler into all the mysteries of the craft. Walton's book is ever delightful from its quaint style, pure tone, and sweet descriptions of nature. As a practical treatise on angling, it is, however, in many essentials out of date, and should not be read without modern editing. *A Book on Angling*, by Francis Francis, is still a standard authority on what we may term cosmopolitan angling.

The early years of the 20th century have been prolific of practical contributions to angling literature, written by the best modern experts, and produced in popular form. The following may be specially recommended:

The Halford Dry Fly Series, by F. M. Halford; *Fly-fishing*, by Sir Edward Grey (Haddon Hall Library); the fishing volumes of the Badminton Library edited by H. Cholmondeley-Pennell; John Bickerdyke's *Book of the All-round Angler* (4 vols.)—Game Fish, Coarse Fish, Pike, and Sea Fish; the fishing volumes of the 'Country Life' Library edited by Horace G. Hutchinson; the Angler's Library, edited by Sir Herbert Maxwell and F. G. Afalo; Sheringham's *Coarse Fishing* (1912); the salmon, pike, and trout volumes of the 'Fur, Feather, and Fin' series; the *Encyclopedia of Sport*; *Salmon Fishing and Trout Fishing*, by W. Earl-Hodgson; *Minor Tactics of the Chalk Stream*, by G. E. M. Skues; *Wet Fly Fishing*, by E. M. Tod, and *A Scottish Fly Fisher*, by A. Leitch (1911); *Grayling Fishing*, by H. A. Rolt; Fennell's *Book of the Roach*, Fennell's *Book of the Pike*, Pratt's *North Country Flies*, Dewar's *Book of the Dry Fly*. In the angling literature of Scotland there are books such as *Salmon Rivers and Lochs of Scotland*, by W. L. Calderwood; *Lochs and Loch Fishing*, by Hamish Stuart; Stewart's *Practical Angler*; Stoddart's *Angler's Companion*; Colquhoun's *Moor and the Loch*; St John's *Sketches*; and *The Angler and the Loop Rod*, by Webster. Handbooks of fishing localities are the *Angler's Diary*; Watson Lyall's *Sportsman's Guide to the Rivers, Lochs, &c. of Scotland*; Regan's *How and Where to Fish in Ireland*. Thomas's *Rod in India*, Goode's *American Fishes* (N.Y. 1888), and the present writer's *Near and Far and Travel and Trout in the Antipodes* refer to other lands. The standard reference work on angling literature is Westwood and Satchell's *Bibliotheca Piscatoria*, with Sampson Low's supplement by R. B. Marston. See also FISHES, FISHERIES, PISCICULTURE, SALMON, TROUT, PERCH, PIKE, etc.

Anglo-Catholic is a term used of the Church of England generally, but especially of the High Church section, which claims that the national church is Catholic (as opposed to Roman Catholic), and repudiates the name of Protestant. See ENGLAND (CHURCH OF).

Anglo-Israelite Theory, an opinion as to the historical origin of the English people held by a considerable number of persons in Britain and America. They contend that the English are descended from the Israelites who were carried into captivity by the Assyrians under Sargon in 721 B.C. The Israelites were carried into Media, where they are identified with the Sæcæ or Scythians, who appeared as a conquering horde there about the same time. They next swarmed westwards into Northern Europe, and became the progenitors in particular of the Saxon invaders of England. Unfortunately for the conclusion, the premises must both be questioned; and we have not yet been presented with any satisfactory proof either that the Anglo-Saxons are the Sæcæ, or that the Sæcæ are the Israelites. And it must not be forgotten that Scythia is much more a geographical than an ethnological term. Moreover, the so-called 'identifications,' on examination, prove to be little more than verbal quibblings on the English letter, depending for their success on the reader's ignorance of Hebrew exegesis. Thus one of the strongest is, that according to prophecy, lost Israel's location must be 'the isles.' The applicability of this to England is at once obvious. But unfortunately for the argument, the word rendered 'island' or 'isle,' is applied in the Hebrew text indifferently to any district on the sea-coast separated from Palestine by water—the shores around the Mediterranean, and the coasts of Greece and Asia Minor, as well as islands proper. Much is made of 'Jacob's stone' in the coronation chair at Westminster Abbey; of the fact that the Irish, or Canaanites, still trouble us according to prophecy; that in public worship we still pray towards the east, as if the posture were peculiar to English Christians; &c. On such feeble arguments as these, we are gravely asked to believe that pro-

phesies which apply to all Israel relate to ten tribes only, to the complete exclusion of the two tribes represented by the Jews throughout the world at the present day. These prophecies, which have no meaning at all if not national and spiritual, are interpreted as if mundane and political, and referring to a portion only of Israel. We are told, moreover, that the well-marked physical features of the Jews are the special effect of the curse of God upon them; and when we ask for any survivals among the English of such peculiar and persistent customs as circumcision, seventh-day observance, legal uncleanness, and the like, we are told that the identity was to be lost, and that our ignorance is the best proof of the theory's being true. Of course, all evidence goes to show the impossibility of such peculiar customs and the language of a nation being so completely forgotten; and it is hardly enough for the opponents of a theory that sets at defiance all ethnological and linguistic evidence to be assured that nevertheless it is proved by a particular interpretation of Scripture assumed to be as infallible as its own authority.

The 'lost tribes of Israel' have been sought for in almost every quarter of the globe, and as one nation answered the conditions of the theory about as well as another, 'the remnants of the ten tribes were found marauding in the Afghan passes, wandering with the reindeer in Lapland, chasing buffaloes on the American prairies, or slaughtering human victims on the teocallis of Mexico.' But the enthusiasm of Rudbeck, Garcia, and Adair had at least one good result: it caused evidence about the facts of manners and customs—afterwards to be, in the hands of scientific students, of great value for the history of civilisation—to be preserved before it was lost before advancing European influences. The ten tribes delusion has now, however, sunk to a lower level than when Lord Kingsborough spent his fortune in publishing the Mexican pictures and chronicles. In spite of all the new real knowledge as to races, it has even now more votaries than ever. 'There is indeed no doubt,' says Sir E. B. Tylor, 'that this abject nonsense has a far larger circulation than all the rational ethnology published in England.'

Anglomania designates, among the French and Germans, a weak imitation of English manners and customs, or an indiscriminate admiration of English institutions. In German literature, an Anglomania was especially prevalent in the 18th century, when translations of English books became numerous, and were read with great admiration. A remarkable Anglomania prevailed in France for some time before the commencement of the Revolution, arising out of admiration of English free institutions. But another kind of Anglomania is often limited to trifles such as fashions and society manners, and in this sense is not unknown in the United States.

Anglo-Saxon Language and Literature. The term Anglo-Saxon was frequently applied, in the works of the last three centuries, to the earliest forms of the English language, up to the date of the Norman Conquest and a little later. English, in short, was described as Anglo-Saxon so long as it remained an inflected tongue, and no longer. The word, however, was never used by the people themselves who spoke that language: from the earliest times they knew themselves, collectively at least, as *Engle*, and their tongue as *Englisc* (or in Latin as *Angli* and *Lingua Anglica*). The Teutonic settlers of Southern Britain, commonly called Anglo-Saxons, were divided indeed into two main branches—one northern, the Anglians or English (in their own dialect,

Engle), who occupied the eastern coast from the Fifth of Forth to the farther limit of Suffolk (see *ANGLES*); and one southern, the Saxons (in their own dialect, *Seaxe*), who held the portion of the island from Essex to Dorsetshire, extending inland to Oxford and the Severn valley. But even the Saxons appear from the beginning to have recognised themselves in a wider sense as *Engle* too; certainly they called their language *Englisc*, and as soon as the territory under the overlordship of the West-Saxon kings acquired a general name, it was known as *Anglia* and *England*. The (late) Latin forms *Angli Saxones* or *Saxones Angli* were first used on the Continent to distinguish the Saxons of Britain (*gens Anglorum, Angulcynn*) from the old Saxons of Germany (*antiqui Saxones, Ald-Seaxen*); but the later compound *Anglo-Saxones*, found not uncommonly in Latin before 1100, is, in its Anglicised form, very rare in old English books, and came into common use for the early Teutonic inhabitants of South Britain and their language, after the latter had become obsolete. It is accordingly not a compound of Angle and Saxon, in the sense that the people arose out of a union of Angles and Saxons. Freeman, Stubbs, Green, and others argue for English or Old English, now very usual in linguistic and historical works; the objection being that a distinct name for the older stage of the language obscures the continuity and suggests a misleading view of its history. But the word Anglo-Saxon still designates, in popular speech, the early inflected form of the English language, and the Teutonic element in the ethnology of Britain.

See *ENGLAND, ENGLISH LANGUAGE, ENGLISH LITERATURE*, and books there named; Green's *Making of England and Conquest of England*; Grant Allen's *Anglo-Saxon Britain*; Stopford Brooke's *Early English Literature* (1892); Sweet's *Primer, Readers, and Student's Dictionary of Anglo-Saxon* (1884-97); and Wright's *Old English Grammar* (1907).

The *ANGLO-SAXON CHRONICLE*, also called the *Saxon* or *English Chronicle*, the most venerable monument of Old English prose and earliest historical prose work in any European vernacular, is a continuous record of English history in English down till the death of Stephen. For the Chronicle there are half-a-dozen main MSS., varying in fullness and the date to which they come down; or rather seven MSS. (A, B, C, D, E, F, G) exhibit a fourfold chronicle. The entries were originally very meagre, but in Alfred's day and under his inspiration the Chronicle rose to the dignity of history. Copies of the earlier part seem then to have been made and sent to the monasteries for continuation. The Winchester Annals practically cease in 1005. The Worcester Annals were carefully kept till 1079. The Peterborough Annals were made up of those of Winchester, Worcester, and Abingdon, and continued in one hand to 1131; another hand using a more modern English carried the work on till the accession of Henry II. in 1154. Canterbury was responsible for at least one or two sections. A few poems, notably the famous ballad on the battle of Brunanburgh, diversify the plain but often vigorous prose of the story. When the Chronicle was closed in 1154, Norman chroniclers took up the tale in Latin.

See B. Thorpe's six-text edition, with translation, in the Rolls Series (1861); John Earle, *Two Saxon Chronicles (A and E) Parallel* (1865); Charles Plummer, *Two of the Saxon Chronicles Parallel* (1889, 1899). The translation by Giles (1847), often reprinted, is not so good as that of Stevenson (1853).

Ango'la is a name formerly used loosely of the whole West African coast from Cape Lopez to Benguela, but now at most of Portuguese West Africa from the Congo to South-west Africa,

and bounded E. by Belgian Congo and Rhodesia. The area is stated at 484,000 sq. m., and the pop. at 4,120,000. The coast strip is level, barren, extremely hot, and very unhealthy. Beyond is hill country, reaching a height of 3000 feet, which promises to become an important source of maize, wheat, and beef. The main rivers are the Kwango, running north to the Congo, and the Coanza and Cunene, running west to the Atlantic. Railways run inland from Lobito Bay and Benguela and from St Paul. There is some export of wax, buffalohides, ivory, copal gum, and palm-oil. The natives are Congo negroes, and belong to the great Bantu stock. Diego Cam discovered this coast in 1486, but the capital, St Paul de Loanda, was not built till 1578. The finances, in spite of very heavy taxes, are most unprosperous. The recruitment of labourers, male and female, for the cocoa islands of St Thomas and Principe was even in the 20th century hardly, if at all, distinguishable from slave-raiding.

Ang'ora (anc. *Ancyra*), capital of a province in Asia Minor, 230 miles ESE. of Constantinople (302 by rail, 1897), was the capital of the Roman province of Galatia Prima, and the scene of two Christian councils (314 and 358). Ancient remains are still to be seen. The *Marmor Ancyranum* furnished materials for the history of Augustus. The present city has 40,000 inhabitants, including many Armenians, and is connected by a branch railway with the system which joins the Sea of Marmora with the Shatt-el-Arab at Basra. At

Angora Goats.

Angora, Mustapha Kemal Pasha after the Great War set up a 'national government' in defiance of Constantinople and the allied powers. It is famous for its breed of goats, with beautiful silky hair eight inches long. There are two or three varieties of the breed. The animal's coat is composed of two sorts of material—one hairy, short, and close to the skin; the other longer and woolly, farther from the skin. The latter is the most plentiful and most valuable. Of this goat's hair, often called *camel's wool*, *camlets* are extensively manufactured here. Many of the animals in this region are characterised by the length and softness of their hair, especially the dogs, rabbits, and cats; but this peculiarity disappears in Europe. The Angora goat is bred for its hair, called Mohair (q.v.), in the United States and in the Cape Province, and has also been introduced into Victoria.

Angostura, the capital of Bolivar state, Venezuela, on the right bank of the Orinoco, about 240 miles from its mouth. It is built at a pass (*angostura*), where the river is narrowed by rocks. The site is only 191 feet above the sea-level; and the Orinoco is navigable to this point for vessels of 300 tons. The town, which dates

from 1764, is the seat of a bishop. It exports balata, chicle, rubber, heron-plumes, gold, tonka beans, hides, cattle. In 1819 it was decreed that its name should be changed to Ciudad Bolívar, after the liberator. Pop. 20,000.

Angostura Bark, or *CUSPARIA BARK*, is the aromatic bitter bark of the *Galipea cusparia*, a native of Venezuela and other tropical countries. It derives its name from the town of Angostura, where it is a considerable article of commerce. It was first brought to England in 1788, although it had been in use in Spain since the year 1759. The *Galipea cusparia* is a small tree belonging to the natural order Rutaceæ, 12 to 15 feet high, with a trunk 3 to 5 inches in diameter. It flourishes at an elevation of 600 to 1000 feet above the sea, and its elegant white blossoms, which appear in great profusion in August, add greatly to the beauty of the scenery.

Angostura Bark is a valuable tonic in dysentery, chronic diarrhoea, and dyspepsia, but it is falling into disuse. It owes its virtues to a volatile oil, and a bitter principle, the nature of which is uncertain, to which the name *Cusparia* has been given. Under the name of Angostura Bitters, an essence containing angostura, canella, cinchona, lemon peel, and other aromatics, came into extensive use as a tonic; but much of what is sold is devoid of angostura, and consists mainly of chertta or other simple tonic. Angostura contains an alkaloid called Angosturia. In the year 1804, a quantity of bark of a highly poisonous nature reached Europe, and being mistaken for Angostura Bark, gave rise to several accidents, and in consequence the use of Angostura Bark was prohibited in some countries. This spurious bark, now known as *False Angostura Bark*, is obtained from the *Strychnos Nux Vomica*, the source of strychnine, and it is readily distinguished from Angostura Bark by the following simple tests: It has no smell, has a resinous fracture, cannot be split up into small laminae, has a pure bitter taste, without aromatic pungency, and when touched with nitric acid, develops on its inner surface a deep red spot, and on its outer an emerald green. Under this test the genuine bark becomes of a dull red colour on either surface.

Angoulême, the capital of the French department of Charente, and formerly of the province of Angoumois, stands 220 feet above the winding Charente, 83 miles NE. of Bordeaux by rail. Its old town has narrow crooked streets, and it contains a fine Romanesque cathedral (1136), and a striking hôtel-de-ville, with which is incorporated the remnant of the ancient castle of Angoulême, where was born the celebrated Marguerite of Navarre, author of the *Heptameron*. Ravallac was also a native. The old bastions have been converted into fine terrace-walks. There are manufactures of machinery, paper, and wire, and a brisk trade in brandy. Pop. (1866) 24,961; (1921) 34,895. The province of Angoumois was in early times a county; but in the 14th century Philip the Fair took possession of it, and it became an appanage of the younger branches of the royal family. It was made a duchy by Francis I., and was sometimes bestowed upon natural sons of the French kings, such as Charles de Valois (1573-1650), son of Charles IX., a distinguished general in the reigns of Henry IV. and Louis XIII. It was given by Louis XIV. to the Duc de Berri, after whose death (1714) the title was attached to the princes of the elder Bourbon line.

Angoulême, LOUIS ANTOINE DE BOURBON, DUC D', the eldest son of Charles X. of France, and Dauphin during his father's reign, was born at Versailles on 6th August 1775. At the Revolution

he retired from France along with his father, and after some years of military studies at Turin, and abortive military operations at the head of a body of French *émigrés* in 1792, he joined the other royal exiles, and lived with them at Holyrood, on the Continent, and latterly in England. In 1799 he married his cousin, Marie Thérèse, the only daughter of Louis XVI. and Marie Antoinette, a woman with something of the spirit of her mother, 'the only man in the family,' in the words of Napoleon. On the recall of his uncle, Louis XVIII., he was appointed lieutenant-general of the kingdom; and when Napoleon returned from Elba, he made a weak attempt to oppose him, but he was soon deserted by his troops, and obliged to surrender. After the second restoration he was charged with the suppression of the disorders in the southern provinces, and in 1823 he led the French army of invasion into Spain. On the revolution in July 1830, he signed, along with his father, an abdication in favour of his nephew, the Duc de Bordeaux; and when the Chambers declared the family of Charles X. to have forfeited the throne, he accompanied him into exile, to Holyrood, to Prague, and to Görz, where he died, 3rd June 1844. On the Duchess there are books by Lenotre (trans. 1908) and Turquan (trans. 1910).

Angoumois. See ANGOULÊME.

Angra, the capital of the Azores, a seaport at the head of a deep bay on the south coast of the island of Terceira. It is a station for ships between Portugal and Brazil and the East Indies; but the harbour is very much exposed. It is the seat of the bishop; is well built, but dirty; has fine churches, and is strongly fortified. Pop. 11,000, many of them Jews. There is a considerable export of wine, cheese, honey, and flax. Since 1834 it has added to its name the words 'do heroismo,' for the conduct of its citizens in the struggle against Don Miguel (1830-32).

Angra-Pequena, or LÜDERITZBUCHT, a bay in the southern part of the coast of Namaqualand (q.v.) in South-west Africa—mainly a sandy, waterless region, but rich apparently in metals, and enjoying a healthy climate. It was the nucleus of what grew to be the large area of German South-west Africa, of which it was the most important place and the only port. In 1883 it was ceded by a Namaqua chieftain to Lüderitz, a Bremen merchant; and next year it was taken under German protection, with all the coast to the north as far as Cape Frio, except Walvisch Bay, which belongs to the Cape Province.

Angri, a town of South Italy, 17 miles NW. of Salerno, with cotton and silk spinning, and 13,000 inhabitants.

Ångström, ANDERS JONAS, a Swedish natural philosopher, was born 13th August 1814, and in 1833 entered the university of Uppsala, where he became a *privat-docent* (1839), keeper of the observatory (1843), and professor of physics (1858). From 1867 till his death, 21st June 1874, he acted as secretary to the Royal Society of Sciences at Uppsala. His works embrace the subjects of heat, magnetism, and especially optics. His *Recherches sur le Spectre solaire* (1869) was an important supplement to Kirchhoff's work on the Solar Spectrum.—His son, KNUT J. ÅNGSTRÖM (1857-1910), was also an eminent physicist (in spectroscopy, solar radiation, and radio-activity), and professor at Uppsala.

Anguilla, or LITTLE SNAKE, one of the Leeward Islands, British West Indies, lying 160 miles E. of Porto Rico, and 60 miles NW. of St Kitts, of which presidency it forms part. Area, 35 sq. m.; pop. 4000. The island is long, winding, and very flat, and contains extensive pastures for cattle and

horses. Cotton, phosphate of lime, and salt are exported.

Anguilla. See EEL.

Anguis. See BLIND-WORM.

Angus. See FORFARSHIRE and DOUGLAS.

Anhalt, a state of the German republic, almost entirely surrounded by the Prussian province of Saxony, which breaks it up into two principal and five smaller portions. Area, 869 sq. m.; pop. (1875) 213,689; (1910) 331,128; (1919) 334,159, nearly all Protestants. Dessau, Bernburg, Kothén, Zerbst, and Rosslau are the principal towns. In the eastern part the country is level and fertile, producing wheat, flax, rape-seed, hops, and tobacco; but the western part, approaching the Harz Mountains, is hilly and largely covered with wood, and possesses mineral wealth, especially in lead and silver. Anhalt began to be an independent principality in the first half of the 13th century. It was repeatedly, in the course of its history, divided amongst branches of the reigning family. There were three duchies in the beginning of the 17th century, but the first line becoming extinct in 1847 and the second in 1863, the whole territory was reunited into one duchy, a republic since 1918.

Anhydrides is the term now commonly given to the compounds formerly known as anhydrous acids, which was a very unsatisfactory name, seeing that these bodies do not present any of the ordinary properties of acids. In some cases they are the result of the dehydration of acids, and in all cases they represent in their composition the acid *minus* water. Thus, in the following equation, we give an example of the formation of an anhydride:

The anhydrides of the monobasic acids are formed in various ways; thus, hypochlorous anhydride is formed by the action of chlorine on oxide of mercury; nitric anhydride is formed by the action of chlorine on nitrate of silver, &c. The anhydrides of tribasic acids are often formed by the mere action of heat on the acids, as is the case with lactic and tartaric acids.

The anhydrides present no uniformity of appearance; for example, carbonic anhydride (commonly known as carbonic acid, which in reality is $\text{CO}_2\text{H}_2\text{O}$) is a gas; phosphoric anhydride is a white powder; nitric anhydride occurs in crystals; sulphuric anhydride is a ductile wax-like substance; while the anhydrides of the organic acids are oily bodies heavier than water.

The most important property of this class is their conversion into the corresponding acids, under the influence of water.

Anhydrite, a mineral, consisting of anhydrous sulphate of lime, with some slight addition of sea-salt, appears in several varieties, as (1) granular, found in concretions with a foliated structure; (2) fibrous, easily broken with a fracture in delicate parallel fibres; (3) radiated, translucent; (4) sparry, or cube spar; (5) compact, of various shades, white, blue, gray, red. Anhydrite is converted into gypsum by combination with a certain proportion of water, and, where it is found in large masses, as on the south of the Harz Mountains near Osterode, the surface consists of gypsum. For building, anhydrite has no great value, on account of its tendency to this change; but some of its varieties, especially the Siliciferous or Vulpinite, found at Vulpino, in Upper Italy, are used for sculptures, and take a fine polish. When burned and reduced to powder, it is used as a manure, resembling gypsum in its effects.

Anhydrous is the term applied to a chemical substance free from water. Thus, ordinary lime-

shell as it comes from the kiln is simply lime, CaO , without any water, and is called *anhydrous* lime; but when water is thrown upon the lime-shell, the liquid disappears by combination with the lime, which very much increases in volume and becomes *hydrated* lime, CaOH_2O . Again, ordinary stucco, before being used by the modeller, contains only lime and sulphuric acid, CaSO_4 , with no water, and is therefore anhydrous; but when water is added, and the stucco sets into its mould, it combines with two equivalents of water, and becomes hydrated stucco, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Examples of anhydrous substances are also found amongst liquids; thus, alcohol free from water is called anhydrous alcohol; and in like manner we speak of anhydrous acetic acid, anhydrous nitric acid, &c.

Ani, a ruined city of Armenia, about 25 miles SE. of Kars. In the 10th century it was the capital of the Bagratide kings of Armenia. Afterwards it was repeatedly taken and sacked, and in the 14th century it was finally overwhelmed by an earthquake. Numerous ruins of buildings and massive walls remain.

Aniline, or AMIDO-BENZENE, was discovered in 1826, as a product of the dry distillation of indigo; hence the name, derived from *anil*, the Portuguese for indigo. This source has now ceased to be of importance, for, practically, all the aniline now manufactured is obtained from coal-tar. When coal is heated in the manufacture of illuminating gas, a large number of substances are produced, and are obtained as a tarry matter of varying composition. Only a few of these bodies are of commercial importance, the chief being ammonia, carbolic acid, anthracene, naphthalene, pitch, and benzene. It is this last-named substance that yields aniline. If it is treated with strong nitric acid, an intermediate compound, nitrobenzene, $\text{C}_6\text{H}_5\text{NO}_2$, is formed, which, when mixed with acetic acid and iron-filings, yields acetate of aniline. Aniline may also be prepared by passing a mixture of benzene and ammonia through a red-hot tube, after the following reaction:

Aniline may be regarded either as benzene in which one atom of hydrogen has been replaced by the group amidogen, NH_2 , or as ammonia, NH_3 , in which one atom of hydrogen has been replaced by the radical phenyl, C_6H_5 ; and according as the one or other view is held, it is called amido-benzene or phenylamine (see ALKALOIDS).

The pure article is a colourless oily fluid, slightly soluble in water, but readily dissolving in alcohol and ether. It refracts light strongly, and possesses a weak aromatic taste. It boils at $360^\circ \text{F. (182}^\circ \text{C.)}$, and when pure, has a specific gravity of 1.020. It is a well-marked *Base* (q.v.), producing numerous crystalline salts, although it has no alkaline action on vegetable colours. It is a powerful narcotic poison, its fumes causing giddiness, and subsequently insensibility, while the body becomes of a livid leaden-blue colour. Taken internally, it soon causes death; and even when respired in small quantity, as by the workmen engaged in its manufacture, it causes severe headaches, nausea, and vomiting.

It is, however, as being the source of the numerous aniline dyes, that this body has become of leading importance.

Aniline unites with acids, forming salts, but these do not constitute the *aniline dyes*. These consist of various bases obtained by the oxidation of aniline by means of nitric acid, chlorine, arsenic, or other agents. In many instances these bases are quite colourless, and only develop their tints

when formed into salts. They may be regarded as Amines (q.v.)—i.e. ammonia in which hydrogen has been replaced by one or more radicals. Thus we have diphenylamine, $\text{NH}(\text{C}_6\text{H}_5)_2$; dimethyl aniline, $\text{N}(\text{C}_6\text{H}_5)(\text{CH}_3)_2$; methyl ethyl aniline, $\text{N}(\text{C}_6\text{H}_5)(\text{CH}_3)(\text{C}_2\text{H}_5)$; and so on. To refer at length to the various aniline dyes would be impossible, as these now number some hundreds, and we can only indicate the leading varieties. The colours produced by these dyes include every shade and tint, and the list of red or violet compounds would alone exhaust our available space. *Fuchsine*, which may be taken as typical of the red dyes, is formed when aniline is treated with strong nitric acid; but, in practice, many other chemicals may be substituted for the acid. *Blue dyes* are produced when aqueous aniline salts are treated with chlorate of potash and hydrochloric acid. *Mauveine*, a powerful violet dye, was discovered by Perkin in 1856, and this led the way in the manufacture of aniline colours. Perkin produced it by acting on aniline with bichromate of potash. We must pass over the various green, brown, yellow, and gray dyes, merely mentioning that the so-called aniline blacks are usually either very intense greens or blues, appearing black through concentration.

The aniline dyes are noted for their intense colouring power; one part of a rosaniline salt in a million parts of water still possessing a deep crimson colour, and instantly dyeing a skein of silk moistened with vinegar. Even in so dilute a solution as one grain dissolved in 1500 gallons of water, it is capable of dyeing a silk thread immersed in it for twenty-four hours.

Many of the dyes exhibit complementary colours (see LIGHT) when looked at by reflected and transmitted light; thus, the strong solution of the salt above referred to looks a purple red by transmitted, and a brilliant green by reflected light; a fact familiar to the users of an aniline red ink, or an ink for any of the familiar 'graph' copying processes. Here the pen assumes a green shining appearance, quite different from the colour of the ink. Aniline dyes are used as lacquers for cheap toys, being readily soluble in spirit varnish, the well-known 'bronzing liquid' being an example of this. Mixed with gelatin or collodion, and allowed to dry in thin sheets, they furnish the thin transparencies so much used for producing stained glass imitations. They have been also used for colouring wines and sweetmeats, but as arsenic was formerly or is still employed in the manufacture of the red varieties, this practice is not unattended with risk. The use of arsenic has of late been largely abandoned; or, when used, makers take care to eliminate the arsenic at the end of the process, so that the final product is innocuous. Numerous cases of skin-eruptions have been traced to the wearing of red flannel or red stockings dyed by aniline dyes. The readiness with which any housewife can dye articles of clothing or household ornaments has made them great favourites. The chief drawback lies in the fugitive nature of many varieties, but notwithstanding there is a wide field still open to them. The aniline colours are as a whole disapproved from the artistic point of view. Some of them are especially objectionable when used in the same textile fabric along with natural dyes. Notwithstanding this, the introduction of aniline dyes is said to have closed half the dyers' shops in India. A few years ago the Shah of Persia prohibited the importation of these colours into that country. Further details about aniline dyes are given under the article DYEING. Although England and France were first in the field, Germany took up the manufacture with so much zeal and scientific skill that it soon surpassed its competitors, pro-

ducing superior shades of colour. Germany is now the headquarters of the industry, its products being of the highest class and the lowest price. The produce in Germany is estimated to be three times that of Britain.

See the obituary notice of Sir W. H. Perkin in *Nature*, 1907; Benedikt's *Chemistry of the Coal-tar Colours*; Hurst's *Dictionary of the Coal-tar Colours*; Nietzki's *Chemistry of the Organic Dyestuffs* (new ed. 1901); and books named at DYEING.

Animal. The popular classification of all bodies into three 'kingdoms'—the animal, the vegetable, and the mineral—only assumed authority in comparatively recent times, and has done much mischief in exaggerating the apparent differences between plants and animals on the one hand, and in obscuring the fundamental distinction between these and minerals on the other. There are in reality only two kingdoms of nature, the living and the non-living—the organic and the inorganic. The famous aphorism of Linnaeus, 'Stones grow; plants grow and live; animals grow, live, and feel,' is no longer satisfactory, for growth is of two distinct kinds. While growth in minerals takes place merely by *accretion*—addition of new particles to the external surface, that of living matter is by *intussusception*—the interposition of new molecules between those formerly present. Again, living matter, or *protoplasm*, is clearly distinguished by its chemical composition, it being composed of very highly complex compounds, or mixture of compounds of carbon, nitrogen, hydrogen, oxygen, and sulphur, together with water and salts. During life, it is incessantly *disintegrating* and combining with the oxygen of the atmosphere, many products of change, chiefly carbonic acid, water, and nitrogenous waste being evolved; and *reintegration* must therefore take place by intussusception, for which purpose new matter containing the necessary elements must be taken up, either from other organisms or from the inorganic world. Certain *cyclical changes* are also exhibited by all forms of living matter—that is to say, each arises as a detached portion of some previous organism; develops into a form similar to that from which it arose; tends to reproduce itself; and, finally, ceases to live, when its protoplasm breaks up, and its elements ultimately return in a highly oxidised state to the inorganic world. Moreover, certain conditions of temperature, pressure, presence of oxygen, &c., variable only within comparatively slender limits, are essential to the maintenance of life.

While living bodies are thus clearly distinguishable from inorganic, every attempt to erect a similarly sharp distinction between plants and animals completely breaks down. Vast numbers of animals are destitute of the power of locomotion, so that, for instance, corals were unhesitatingly referred to the vegetable kingdom until about a century ago; while diatoms, and many embryonic algae and fungi, which possess marked powers of locomotion, would thus require to be ranked as animals. Nor is sensibility a purely animal characteristic; the well-known sensitive plant, the sun-dew, and Venus's fly-trap, exhibiting it in the most marked degree. Cellulose, again, which forms the coating of the vegetable cell, was regarded as completely characteristic of this; but many algae and fungi are naked at some period of their lives, while the thick external tunic of those degraded vertebrates known as Ascidians has essentially the chemical composition of plant cellulose. Chlorophyll, the green colouring matter of plants, is absent from fungi and from many flowering parasites, and is present in infusorians of animal mobility, if not even in higher forms, which thus vegetate in sunshine, forming starch and evolving oxygen. Some

insects, it is asserted, use the energy of sunlight for carbon-assimilation; while the well-known insectivorous plants (see *DIONÆA*, *SUN-DEW*) capture animals, and frequently digest them.

The attempt to establish a difference in structure is equally unsuccessful; for although the students of higher forms have no difficulty in grouping their flowers and ferns, their birds and beasts, into distinct series, the microscopist finds that these two great stems arise from a common root. It has therefore repeatedly been proposed to divide living forms into three groups—Animals, Plants, and *Protista*—a solution which, while decidedly gaining adoption on account of its great service in treating together the lowest forms hitherto separated as Protozoa and Protophytes, of course raises minor difficulties—that of distinguishing on the one hand between Protists and Animals, and on the other, between Protists and Plants. And thus every attempt to limit and define its forms has really resulted in proving the fundamental unity of life. The general study of the phenomena of life constitutes the science of Biology (q.v.), with its sub-sciences. For animal morphology, see *ZOOLOGY*, *ANATOMY*, *VERTEBRATA*, *MAMMALS*, *BRAIN*, *FOOT*, etc.; for animal physiology, *PHYSIOLOGY*, *BIOLOGY*, *CELL*, *EMBRYOLOGY*, *CIRCULATION*, *DIGESTION*, *NUTRITION*, *REPRODUCTION*. See also *GEOGRAPHICAL DISTRIBUTION*, *EVOLUTION*, etc.; for animal intelligence, see *INSTINCT*.

Animal Chemistry has for its subject the knowledge of the chemical phenomena of life in the animal body. In view of the essential similarity between the processes of life in the animal and in the vegetable kingdom, the distinction between the chemical processes in animals and in plants respectively is now no longer made, and the more general terms physiological chemistry or biochemistry are used to denote the science of the chemistry of life, which is the chemistry of protoplasm, the living substrate of the cell. Its object is to study the composition and properties of protoplasm and its various modifications, which form the tissues and organs of living things; to ascertain the precise nature of the constructive and destructive changes which take place in the living cell, or in the various tissues and organs, or in the organism as a whole; and to investigate the nature of the various agents by which these changes are effected. The study of the various aspects of biochemistry requires methods differing so widely that biochemistry is divided into a number of branches, each of which has attained almost to the rank of a separate science.

The first step to an understanding of the chemistry of life is a knowledge of the chemical composition of protoplasm. This is obtained by the methods of organic and inorganic chemistry. Protoplasm consists mainly of water, amounting to about 75 per cent. of its weight. It contains a small amount of inorganic salts and a number of organic substances, which according to their chemical constitution fall into different groups—viz. proteins, carbohydrates, fats, and lipoids (i.e. ether soluble substances). There are also a number of organic substances representing products of functional activity of the protoplasm. In the nucleus, the governing centre of the cell, protein is combined with nucleic acid, a complex compound of phosphoric acid with a number of organic substances (purin bodies, sugars, &c.). The inorganic salts are present in protoplasm dissolved in water mainly in the form of true solutions. The phenomena of osmosis and diffusion, which such true solutions exhibit, are also exhibited by protoplasm, and play an important part in the chemistry of life. The other organic substances are present in protoplasm mostly in the form of apparent solutions. These solutions are in reality very fine suspensions,

the particles of which are not visible even with the highest powers of the microscope. Their appearance can be demonstrated by the so-called ultra-microscope. Such apparent solutions are called colloidal solutions. The chemical and physical properties of colloidal solutions are quite different from those of true solutions. The study of the chemistry of colloids and of the processes of osmosis and diffusion in their relation to life forms an important branch of biochemistry.

The chemical structure of almost all the substances present in protoplasm is known in all the essential features. But this knowledge, although indispensable for the understanding of the study of metabolism, the sum total of all the chemical changes which take place in the cell, gives no clue to the mechanism by means of which protoplasm is able to effect these changes. Some of the chemical processes which take place in the body can be carried out also by the chemist in the laboratory. But in order to attain this the chemist requires strong agents, such as heat, high pressure, strong acids or alkalis. In the living cell these changes proceed at body-temperature without the aid of any of these agents. It was believed, therefore, that the living cell possessed a special 'vital force,' which was indissolubly bound up with the life and structure of the cell. The work of the twentieth century has forced biologists to give up this idea. By suitable means the life and structure of a cell can be completely destroyed, while the remaining mass is still capable of inducing the changes which characterised the activity of living cells. Further investigations have shown that these activities are due to the presence of enzymes or ferments. These substances act by facilitating or accelerating a reaction, which in their absence would not take place at all or only very slowly. A very small and indeed unweighable amount of a ferment is capable of inducing a chemical change in a large amount of the substrate on which it acts. No ferment has as yet been prepared in a pure state, and the chemical nature of ferments is not known. But in inorganic chemistry some substances, such as porous platinum or a colloidal gold solution, are known which have a similar effect. Such substances are called catalysts. Ferments are catalysts.

Living cells react in a remarkable manner to certain chemical stimuli. The introduction into the body of certain foreign matter, such as cells or tissue-fluids from another species of animal, of bacteria or the toxic products of bacteria, stimulates the cell to produce new substances capable of reacting with this foreign matter. Thus the introduction of bacteria leads to the formation of substances which kill the bacteria. The administration of toxic bacterial products—for instance, diphtheria toxin—calls forth the production of an antitoxin, which neutralises the toxin. In this way protoplasm protects itself, renders itself 'immune' against harmful chemical stimuli. This important branch of biochemistry is called immunochemistry.

See Hammarsten, *Text-book of Physiological Chemistry* (7th ed. 1910); Schäfer's, Stirling's, or other modern text-book of physiology.

Animalcule, a term which, although etymologically applicable to any very small animal, is limited in ordinary language to those which are microscopical. Animalcules exist in prodigious numbers, their size being such that myriads of them find ample space for all the movements of an active life within a single drop of water. Sea-water often contains them in enormous numbers, and the luminosity of the sea is often due to this cause (*Noctiluca*). Although, contrary to a widely diffused belief, they occur only in very small number in drinkable waters, they abound wherever

water becomes stagnant, or contains decomposable organic matter. Thus rain-water allowed to stand long in an open cistern, or the water of a vase in which cut flowers are placed, soon becomes more or less turbid and offensive; and if a drop be placed on a slip of glass and examined, even with a pocket lens, a multitude of living beings can be seen moving rapidly in all directions, while minute specks are also to be seen in motion between these. On the application of higher microscopic power, new organisms come again into view, so that the variations of size between the invisible inhabitants of one drop are as great as those between whales and minnows. An immense variety of animalcules can very easily be studied by collecting impure water from a dozen different sources, and keeping it separate in open wide-mouthed bottles in a window, and observing from time to time; for not only do the contents of the different vessels differ from each other, but they also vary greatly with the season, so that an unending source of new surprises is thus open to the most inexperienced microscopist without leaving his room. Besides obtaining numerous varieties of microscopic algae, diatoms, bacteria, &c. (see *ALGÆ*, *DIATOMS*, *PROTOPHYTES*), examples of all the leading forms of minute animal life are thus to be obtained; and these, at first supposed to belong to the same general type of structure, are now known to be extremely varied. The simplest form which the observer will meet is a naked lump of jelly-like protoplasm, constantly flowing into new shapes, the *Amoeba* (q.v.); while other masses of jelly, the *Foraminifera* (q.v.), may be found possessed of coverings of sand, or even carbonate of lime, and only protruding their irregular processes (pseudopodia) through its openings. Others again, the sun-animalcules of fresh water, and the Radiolarians, which inhabit the sea, are usually possessed of a beautifully marked flinty skeleton. These groups are usually united under the head of *Rhizopoda* (q.v.). Another great series, in which the form of the body is usually definite, the pseudopodia being generally replaced by vibratile threads or cilia, are termed the *Infusoria* (q.v.). All these are the equivalents only of a single cell of higher animals, and are therefore grouped into the subkingdom Protozoa; but many animalcules are of far more complex organisation. Thus the wheel-animalcules (see *ROTIFERA*) are segmented, worm-like animals; and the larvæ of almost all marine and fresh-water invertebrates are at an early stage free-swimming and microscopic. From its extreme vagueness, therefore, the term animalcule is now disused by scientific writers.

Despite their apparent insignificance, certain animalcules, by virtue of their almost imperishable skeletons, are among the most important agencies which have built up the crust of the earth. The surface of the sea is largely inhabited by Radiolarians and Foraminifera, the former preponderating in cold, the latter in temperate and tropical waters. As they die, their skeletons sink to the bottom, and form mud or ooze, which through time and pressure becomes consolidated into rock. Many polishing stones, &c. are thus mainly composed of Radiolaria; while chalk is principally formed by the skeletons of Foraminifera, and greensand of internal siliceous casts of these. Many limestones, marbles, quartzites, &c. are probably of similar origin, although all trace of organic structure may have been eliminated by metamorphic change. See *PROTOZOA*, *PROTOPHYTES*, and other articles named above; also any adequate work on microscopy—Carpenter's (8th ed. 1901), or Spitta's (1907).

Animal Heat. Living protoplasm is constantly in process of disintegration and oxidation, and these changes are accompanied by evolution

of heat. The greater the activity of change, the higher does the temperature tend to become. Not only, therefore, are the so-called cold-blooded animals really warmer than the surrounding atmosphere, but even plants recognisably evolve heat, and the temperature of certain flowers, where protoplasmic activity is highest, may sometimes almost reach that of the human body. See *ARUM*.

Even the infusoria evolve heat, as is shown by the slowness with which the surrounding water freezes. John Hunter showed that worms and leeches, slugs and snails, were all one or two degrees warmer than the air. Fishes generally are only two or three degrees warmer than the water they inhabit; but in some of the more active, like the bonito and tunny, a temperature of 99° F. has been observed, while the surrounding water was at 80½°. So, too, the frog, which usually averages about 1° warmer than the air, is 2° or 3° warmer while breeding; while in certain lizards and snakes, a difference of as much as 15° to 20° F. has been recorded. Newport's researches on insects show that while the temperature of the larva may vary from ½° to 4° above that of the atmosphere, that of the pupa is almost imperceptibly higher, and that of the perfect insect may rise enormously; a difference of from 2° or 3° at rest, to from 9° to 20° in excitement, having been observed in individual bees, and a much more marked elevation in the temperature of the whole hive, which has been observed to reach 102° F. Among the animals commonly termed warm-blooded, the temperature, although generally higher in birds than in mammals, varies from species to species, yet is very nearly constant during health in each. Thus, while the average temperature of the human body is about 98·4° F., that of the wolf is 3° or 4° lower, and that of the arctic fox 5° or 6° higher. In birds, the temperature varies from 100° in the gull and other aquatic birds, to nearly 112° in the swallow, while, on the other hand, a hibernating mammal like the lemming becomes temporarily cold-blooded, its temperature during the winter sleep being comparatively little above that of the atmosphere.

From the preceding details, it will be seen that while cold-blooded and warm-blooded animals thoroughly agree in evolving considerable amounts of heat, the difference between them lies in this, that in the former the means of loss of heat by the skin, &c. are great as compared with the normal production of heat, while in the latter the loss and production of heat are kept balanced.

Physiologically considered, the animal body is a machine for converting the potential energy supplied by food into the actual energy of heat and mechanical work. What Aristotle simply referred to the heart, and mechanical physiologists to the friction of the blood, and so on, is now simply regarded as one of the results of the disintegration of the complex protoplasm. Knowing the quantity and chemical composition of the food, it is easy to calculate the amount of energy furnished to the body. The average income of energy of the human body on normal diet is about 1,000,000 metre-kilogrammes, of which about 150,000 units can be expended in muscular work, the remaining 850,000 leaving the body in the form of heat. As to the channels by which heat leaves the body, Helmholtz has calculated that fully 2½ per cent. leaves the body with the fluid and solid egesta, about 5½ per cent. is spent in warming the expired air, about 14½ in evaporating the water expired by the lungs, and the balance, about 77½ per cent., by the skin, in conduction, radiation, and evaporation.

These general considerations once grasped, the apparent anomalies and variations in the temperature of different animals present no difficulty.

While heat is given off by the oxidation of the living matter of all the tissues, the greater part is the result of the activity of the muscular and glandular systems, and especially of the former.

For the lower or cold-blooded animals, the varying temperature is simply and directly associated with the varying amount of protoplasmic waste, and this again with the varying activities of the organism. The case of higher or warm-blooded animals (mammals and birds) presents, however, greater difficulty, since here the temperature remains practically constant throughout life (neglecting slight diurnal and seasonal variations, or the more serious perturbations due to the excitation and depression of the vital processes in various diseases). Some regulative mechanism must here be present, operating on the one hand to insure the regular maintenance of a minimum temperature, on the other to check its undue rise in periods of exceptional activity. This problem has been the subject of much physiological research, and is not yet fully exhausted; its essential solution is, however, due to Claude Bernard, whose *Chaleur Animale* (1876) may be taken as a centre round which the literature of the subject arranges itself, and continues to develop.

The regulation of heat is on the one hand automatically effected by the variations in the quantity lost in warming the breathed air, in the flow of blood through the skin, and in perspiration. Thus if more air be passed in and out of the lungs in a given time, or if the vaso-motor nerves allow the skin blood-vessels to dilate and admit of a larger flow, or if perspiration increase, the body will become cooler, and *vice versa*. But on the other hand there is every reason to believe, since the researches of Hoppe-Seyler, Liebermeister, and others, that the production of heat through the activity of muscles and other organs is controlled by means of a special heat-regulating and nervous mechanism. Eulenberg and Landors have demonstrated a certain area in the brain, which, when stimulated, affects the temperature of the body. See PHYSIOLOGY, TEMPERATURE OF THE BODY.

Animal Kingdom. See ANIMAL, ZOOLOGY.

Animal Magnetism, MESMERISM, or HYPNOTISM. From time immemorial, Egyptian conjurers and sorcerers have been accustomed to produce artificial somnambulism, usually by inducing their subject to gaze intently for a few minutes at certain symbolic signs marked on the centre of a white plate. The Yogins, Hindu ascetics, also practise similar arts; while the peculiar states of trance or ecstasy into which the Mount Athos monks and other religious fanatics were accustomed to throw themselves are of kindred nature. So, too, many allusions in the works of classical authors relate to phenomena more or less of this kind.

About the middle of the 17th century, while the phenomena of terrestrial magnetism were attracting considerable attention, one Valentine Greatrakes, in London, professed to cure diseases by stroking with the hand. A century later, Gassner, a Swabian priest, employed a similar mode of treating disease, which he ascribed to demoniacal possession. About 1774, Mesmer, a Viennese physician, commenced to treat diseased organs by the application of artificial magnets. The phenomena exhibited by his patients, especially the more nervous of them, led him to adopt the view that the magnets operated not as special sources of influence, but as conductors of a magnetic fluid which he could communicate at will to the patient, even at a distance. Four years later, he commenced practice in Paris, with great success. His usual methods were to seat his patient with his

back to the north, to press the pit of the stomach, and make passes with his hands in front of his face, meanwhile fixing his patient's eye, and soothing him by the aid of music. Sometimes too he placed his patients in connection with 'magnetised trees, or set them in a circle around a covered vessel from which he professed to conduct the invisible fluid, thus inducing peculiar nervous conditions. In 1785 a royal commission was appointed to examine Mesmer's pretensions. These investigators found that the same phenomena could be produced in Mesmer's more nervous patients when blindfolded, by merely inducing them to suppose themselves in the neighbourhood of any of Mesmer's magnetic appliances, though none were really present; while conversely, magnets and magnetic trees were alike powerless, if the patient were kept unaware of their proximity. The Marquis de Puységur at the same time discovered that he could induce artificial somnambulism without the aid of magnets, by passes alone; but unfortunately for further investigation, the subject fell into the hands of the arch-quack, Cagliostro (q.v.), and thus became extremely discredited by physiologists. Despite the unfavourable report of the French commission of 1785, as well as of a later one in 1831, and other subsequent exposures, vague theories of magnetic influence, odyllic force, new imponderable substance, electrobiology, or the like, kept constantly recurring, since science had nothing with which to replace them, until the investigations of James Braid, a Scottish surgeon settled in Manchester. In 1841 he went to a mesmeric séance, which seemed to him a mere triumph of imposture over credulity; but returning on another occasion to watch the details more narrowly, he was struck to find that the patient was really unable to keep his eyes open. After some reflection, he concluded that by continuous staring, the eyes with their nerve centres became fatigued, and the balance of the nervous system was thus destroyed. Resorting to experiment, he at once succeeded in throwing his servant and others into thorough mesmeric sleep by simply inducing them to gaze intently for a few minutes at the mouth of a bottle placed above, but close to, the eyes. He thus proved the absolute dependence of the mesmeric phenomena upon the physiological condition of the patient, not on that of the operator; and found that he had here to deal with a new order of cerebral states, henceforth to be classed with those of sleep, somnambulism, and insanity. He therefore proposed the word hypnotism, which now so advantageously replaces the terms animal magnetism and mesmerism. Braid continued his investigations for years, and attempted the treatment of certain diseases by inducing hypnotism. But the evil repute into which the subject had fallen prevented due appreciation of Braid's discoveries; not till after 1873 was hypnotism thoroughly investigated by physiologists, when Preyer and Heidenhain in Germany and Richet in France confirmed and extended Braid's results. No scientific observer has yet confirmed the statements of mesmerists as to clairvoyance, reading of sealed letters, influence on unconscious persons at a distance, or the like; and though the influence of the mesmeriser seems in many cases to be unimportant, 20th century experiments by Dr W. Kilner in London with diaphanous screens suggest that an actual current does pass from the operator to the subject, as shown by rays of light projecting from the finger-tips.

The physiological changes which are set up are usually as follows: A spasm of the accommodating apparatus first takes place, the pupils meanwhile dilating, and the eyeballs being protruded, while the eyelids droop. Respiration and

circulation become greatly accelerated, and perspiration frequently ensues. Finally, profound stupor may follow. A very remarkable degree of insensibility to pain exists, so that even surgical operations may sometimes be performed as well as under chloroform. The reflex irritability of all the voluntary muscles is greatly increased (indeed for days after the experiment), so that stroking an area of skin produces a spasm of the subjacent muscles, which may even spread over the whole body, producing a practically cataleptic rigidity, so that Heidenhain indeed considered the hypnotic state as nothing more than artificially produced catalepsy. These considerations indicate the danger of repeatedly subjecting the same person to hypnotic experiments, lest the abnormal state should be rendered permanent. Moreover, since in some persons the hypnotic state begins with general convulsions, the non-medical reader is warned against attempting to hypnotise.

During hypnotism, consciousness is diminished or dormant. The patient may, if only slightly affected, remember what has happened; if more fully hypnotised, he has no remembrance of his actions until hints are given; in the most complete state, he has no remembrance whatever. In hypnosis, however, sensory perceptions take place; but these are not converted into conscious ideas—in other words (as constantly happens in a 'brown study'), the sensation is present, but the power of directing the attention towards it is temporarily lost. Reflex action, however, goes on all the more freely in the absence of the inhibiting will; and thus movements made before a hypnotised person are perceived by the imperfectly closed eyes, and the stimulation of the organ of sense sets up a material change in the central nervous system, which liberates movements, apparently voluntary, yet not really so. Thus the patient may be induced to imitate every movement, however absurd or trivial, which is presented to him. The tendency to mimicry, so common especially in children, monkeys, parrots, &c., is thus intensified, or rather the stimulus of the sensory impression is allowed to work unchecked.

As sometimes in ordinary sleep, but here with ease and certainty, dreaming may be induced. Thus the medium may be conducted through all the stages of a journey, may be plunged into grief or raised to exuberant happiness by a few judicious suggestions. This state is nearly related to that of 'automatism at command,' where the medium obeys orders like a docile dog. Thus, as a crucial experiment, Heidenhain ordered his brother, a young medical student, to cut off his whiskers, the product of a year's assiduous cultivation, to the unbounded vexation of the unfortunate youth on awaking. So too, placing the body in a given position calls up the appropriate actions. A pillow, properly placed in the medium's arms, is nursed like a baby; music makes him dance; and so on. In all cases, the spoken command, the position of the limbs, or the sensory stimulus, sets up the impulse to the actions indicated, without either intelligence or volition being awakened.

The patient never falls down, and the power of co-ordinating the movements of walking, &c. is nearly perfect; his attitudes have often an unusual grace, and in the lighter stages of hypnotism he may converse freely and even with unwonted intelligence and emotion, due, doubtless, partly to freedom from the restraint of a knowledge of the surroundings, partly to the concentration upon a single train of thought. Very sensitive patients may be hypnotised by monotonous sounds like the ticking of a watch, or even by expectant attention, when alone.

Numerous other remarkable phenomena have

been described. Thus, by gentle pressure on the neck of a patient, he can be induced to repeat words spoken in his presence, especially when the sounds are directed to a sensitive area just below the sternum. Automatism at command is greatly facilitated by imposition of the operator's hand on the patient's head. By passes on one side, catalepsy or paralysis of the opposite side only can sometimes be induced. Remarkable disturbances of the sensation of colour may take place. The state of the brain during hypnosis is not as yet well understood. The activity of the ganglion-cells of the cerebral cortex appears to be inhibited by the gentle prolonged stimulation. Additional light has been obtained by experiments upon animals.

Hypnotism came largely into use in medical practice in the last quarter of the 19th century, and its facts have important bearings on the phenomena of reverie, trance, somnambulism, religious excitement, mania, and spiritualism. There is reason to suspect also that the conventional surroundings and processes of education are not free from a pernicious tendency to produce and operate on essentially sub-hypnotic states of the pupils. Considerable light has been thrown by hypnotism upon the normal processes of cerebration, and on the action and mode of correlation of the senses.

See Braid's *Magic, Animal Magnetism, &c.* (3rd ed. 1852); Heidenhain's *Animal Magnetism* (1880); Binet and Féré, *Animal Magnetism* (1886); and for modern medical applications, the article HYPNOTISM and works by Branwell (1903), Ash (1901), and Moll (1909).

Animals, CRUELTY TO, was first dealt with by legislation in Britain, where also societies for its prevention were earliest established. But till the 19th century the laws looked mainly to the protection of property. The English Society for the Prevention of Cruelty to Animals was founded in 1824, the Scottish society in 1839. Bear-baiting and bull-baiting were put down by law in 1835. From 1845 onwards other statutes were passed from time to time with a view to secure more humane treatment of domestic animals, wild animals in captivity, &c. Most of the earlier acts are now repealed, and their provisions consolidated and amended in the Protection of Animals Acts, 1911 and 1912, which are applicable to England and Ireland. The word 'animal' in these acts includes any domestic or captive animal, whether quadruped or not, and any bird, fish, or reptile which is in confinement, or which is maimed, pinioned, or kept otherwise in captivity. The offences, which under the acts are punishable summarily by imprisonment for three months, or a fine not exceeding £25, or both, include cruelly beating, kicking, ill-treating, or over-riding an animal; causing unnecessary suffering in carrying or conveying an animal; baiting any animal or keeping premises for that purpose; administering poisonous or injurious drugs; or subjecting an animal to any operation performed without due care and humanity. These provisions do not apply to Vivisection (q.v.) as regulated by the Prevention of Cruelty to Animals Act, 1896; or to the destruction of animals for food, unless unnecessary suffering is inflicted. The court, if satisfied that it would be cruel to keep the animal alive, may order its destruction at the expense of the owner. Failure to feed imprisoned animals is an offence punishable summarily with a fine of £5. Regulations are enacted for the conduct of knackers' yards. The shooting of captive birds was prohibited by an act of 1921. By the Protection of Animals (Scotland) Act, 1912, the law of Scotland on this whole subject has been in effect assimilated to that of England and Ireland.

Animals, WORSHIP OF, according to most students of comparative religion, is a stage in the

religious evolution, characteristic of the less cultured races, which has sometimes held its place in the higher stages of civilisation. It originates in Animism (q.v.), or spirit-worship, which is a universal phenomenon of humanity. The savage recognises in the animal, power or courage beyond his own, as well as a soul similar to his own, which continues to exist after death, and is still powerful for good or evil. Naturally, he tries to conciliate the power for evil indwelling in the animal, and thus reaches the stage of full or direct worship, in which he recognises the animal as the incarnation of a divine soul. Or he may recognise it as something acted through by a deity, and in his worship he is thus reverencing only the representative or symbol of some unseen deity, who for some reason assumes the form of the animal as his symbol.

But a wider and deeper motive for such worship is his veneration for the animal as a totem or representative of a tribe-ancestor or protector. Among primitive peoples, all animals are supposed to be endowed with souls, which in many cases have formerly animated human beings. Hence a likeness is often recognised between an animal and some deceased friend, and the animal is addressed as the person would have been, and honoured with a kind of worship. The case of an ancestral soul, worshipped as incarnate in an animal body, thus forms a link between manes-worship and beast-worship; and we find this connection otherwise in the veneration of a particular species of animal by a particular family, clan, or tribe. Many tribes call themselves by the name of some animal, and even derive their pedigree from it. Its cries become the omens of the tribe, and here we may find a key to an explanation of the divination and augury of more civilised nations. This curious and widespread belief in a descent from animals in connection with a belief in transmigration into other forms, goes far to explain such phenomena as lycanthropy (see WER-WOLF) and the unions between animals and human beings so common in folk-lore, and has doubtless originated in totemism (see TOTEM). The division of a tribe into the families of the bear, crane, turtle, &c. indicates a time when families claiming descent from ancestors holding those names have banded themselves together for the common interest; and that an ancestor should be called the bear, or turtle, or crane, indicates a time still further back, when the name was given him for some reason. Many ethnologists, notably Herbert Spencer, suppose these names to have been originally personal epithets, designating qualities or characteristics of the individual (thus, a slow man would be called a turtle, a very long-legged man a crane), which became family surnames, and eventually gave rise to myths of the families being actually descended from the animals in question as ancestors; while popular mystification between the great ancestor and the creature whose name he held and handed down to his race, led to veneration for the creature itself, and thence to full animal-worship. The name was originally a mere nickname, but in process of time the meaning of the metaphor was lost, and the belief originated and was transmitted to posterity that the animal was the actual progenitor. Though such nicknaming as this has occurred, totemism must have had a much broader and deeper foundation. The mere fear of ancestral ghosts is too narrow a basis on which to build, as Spencer did, the whole structure of myth and religion, and does not allow sufficient play for the creative force of man's imagination as applied to the wondrous universe around him. Perhaps the worship of personal deities, seen in its greatest development in the North American native races, will lead us to a more satisfactory explanation of

the origin of totemism as the basis of animal-worship. The *manitou* of the Indian is almost always an animal, and is chosen by each individual at his coming of age, being pointed out to him in a dream, produced by the greatest religious act of his life—his first fast. This animal then becomes an object of worship, and its skin is carried about the person as a fetish, and its likeness painted on the body or sculptured on the weapons. Thus tattooing and primitive heraldry may be explained as forms of worship, and here also we see the reason for the superstitious fear the savage entertains of killing or eating his *manitou*, or patron-animal. The *manitou* develops into the totem, or sacred animal, of the gens or family which descends from that person, and worship is paid to all representatives of its species. Equally strong evidence is obtained from the ancient nations. Some facts are preserved in the signs of the zodiac, the majority of which are animals, or compounds of human and animal forms. There is nothing in the grouping of the stars to suggest animal forms, and the probability is, that in ancient as in modern times, stars, when named, were given names of distinction that commanded respect, if not veneration; therefore that the animals whose names were transferred to the stars were, on earth, highly, if not religiously venerated. This is borne out by the legends of the transference to the heavens of particular animals. The frequency, also, of animal-names, and of representations of the same animals upon coins, points to the same conclusion. In the old Egyptian animal-worship, also, the theory of tribe-fetishes and deified totems is borne out. We find deities patronising special sacred animals, incarnate in their bodies or represented in their figures; while many of the sacred creatures are worshipped in one locality, yet killed and eaten with impunity elsewhere.

In the modern world, the most civilised people among whom animal-worship vigorously survives lie within the range of Brahmanism. Here, says Tylor, the sacred cow is not merely to be spared; she is, as a deity, worshipped and bowed to daily by the pious Hindu, who offers her fresh grass and flowers. Siva is incarnate in Hanuman, the monkey-god, as Durga is in the jackal; the wise Ganesa wears the elephant's head; the divine king of birds, Garuda, is Vishnu's vehicle; and the forms of fish, and boar, and tortoise are assumed in the avatar-legends of Vishnu, which are at the intellectual level of those Red Indian myths which they so curiously resemble. Perhaps no worship has prevailed more widely than that of the serpent. It had its place in Egypt and among the Hebrews; in Greece and Rome; among the Celts and Scandinavians in Europe; in Persia and India; in China and Tibet; in Mexico and Peru; in Africa, where it long flourished as the state religion in Dahomey; in Java and Ceylon; among the Fijians, and elsewhere in Oceania. And even within the limits of Christianity, we find the sect of the Ophites, who continued or renewed snake-worship, blended curiously with purer rites. It is evident, however, that although some animals may have received a preference, yet all had a share in the superstitious reverence of primitive peoples; and this broad universality of their worship militates against any other theory of its origin except that based on a belief in the free transmigration of souls from men to animals, and from animals to men, inherited from an early totem stage of society.

See Fergusson's *Tree and Serpent Worship* (1868); M'Lennan in the *Fortnightly Review* for 1869 and 1870; Herbert Spencer in the *Fortnightly Review* for 1870; chap. xv. of Tylor's *Primitive Culture* (1871); Gubernatis' *Zoological Mythology* (1874), for its facts; Robertson Smith in the *Journal of Philology* (1880); chap. vi. of Dornan's *Origin of Primitive Superstitions* (Philadelphia, 1881); Lang's *Custom and Myth* (1884), *Myth, Ritual, and Religion* (1887), and *Magic and Religion* (1901).

An'ima Mundi, according to many of the early philosophers, a force or vital principle immaterial, yet not intelligent; inseparable from matter, but giving it its form and movement, the source of all physical and sentient life. Plato held it impossible for pure spirit—the atmosphere in which alone eternal and archetypal ideas could exist—to bear any relation whatever to matter, and he therefore supposed the latter to be operated upon by an intermediate agency, the *anima mundi*. In the system of the Stoics, it was conceived to be the sole vital force in the universe; it usurped the office of pure spirit, and the doctrine became indistinguishable from Pantheism (q.v.). The notion does not seem to have been entertained by the schoolmen, but it reappears in the writings of Cornelius Agrippa, Paracelsus, and Van Helmont, and, in a modified form, was held by More and Cudworth. The latter recognised in 'plastic nature' the universal agent of physical phenomena. Amos Comenius found argument from Gen. i. 2 to prove that the spirit that 'moved on the face of the waters' still gives life to all nature. The doctrine of the immaterial *anima*, in matter, but distinct from it, was upheld by Stahl in 1720; but his term *animism* has now been adopted with a much wider signification by Sir E. B. Tylor and other anthropologists. See ANIMISM.

An'imé, a resin exuding from the trunk of the *Hymenæa courbaril*, a large tree of the natural order Leguminosæ, sub-order Cæsalpinieæ, a native of tropical America. It somewhat resembles copal, to which in France the name *résine animé* is applied, but is more easily soluble in alcohol. Like the New Zealand dammar it is often found in lumps underground.—The name anime, or gum anime, is, however, also given in Britain to a resin called in India copal, the produce of *Vateria indica* (Dipterocarpaceæ); whilst the copal of Brazil, and apparently of Mexico, is (wholly or partly) produced by several species of *Hymenæa*. See also COPAL.

Animism, a term originally used to denote the theory of Stahl (q.v.), which regarded the vital principle and the soul as identical, but now used in the sense given to it by Sir E. B. Tylor as the general doctrine of spiritual being. Sir E. B. Tylor took the belief in spiritual existence as a minimum definition of religion. It appears among all low tribes with which we have any intimate acquaintance; and all travellers who have hitherto asserted the existence of races without it have been afterwards refuted by the facts. It may be considered to have arisen simply from the evidence of the senses, interpreted by the crude and childlike science of the savage. Two problems seem to have exercised the primitive mind. First, What is it which makes the difference between a living body and a dead one? what causes waking, sleep, trance, disease, and death? In the second place, What are those human shapes which appear in dreams and visions? The savage makes these two groups of phenomena each help to account for the other, by combining both in the conception of an apparitional or ghost soul, which is conceived of as an insubstantial human image, resembling a vapour or a shadow, the cause of life and thought in the individual it animates, capable of leaving the body and appearing to men waking or asleep as a phantasm separate from the body of which it bears the likeness, and able to enter into, possess, and act in the bodies of other men, of animals, and even of things inanimate. When the sleeper awakens from a dream, he believes that his soul has really been away, or that the souls of others have come to him. His body has been still, but his living self or soul, his phantom or image, has been active. And have

not waking men, in broad daylight, sometimes seen these human phantoms in what are called visions or hallucinations; and after a man has died and been buried, has not his phantom-figure continued to appear to the survivors in dreams and visions? And what is his reflection seen in still water, or his shadow falling behind him, or the breath seen for a moment issuing from his lips like a faint cloud, but the man's ghost-soul becoming visible for a moment and vanishing again? In the thought of the savage, as of the child, personality is ascribed not to men and beasts only, but also to things. His ghosts do not come to him naked, but dressed in the well-known clothing worn in life. This is the explanation of one of the most wide-spread rites of animistic religion—the offering of funeral sacrifices for the service of the dead. The phantasmal images of the objects offered pass into the possession of forms shadowy like themselves—the souls of the dead. These spiritual beings fill all nature, animate and inanimate, and their life is a continuation and not a new life in savage religion. They transmigrate into human beings, animals, plants, and lifeless things, and they can avenge their past and present wrongs by bringing disease upon the offender. The man keeps after death the temper he had in life, and is powerful for good or evil according to his inclinations while alive. From this, and not from mere family affection, arises naturally the ancestor-worship which has been from remote antiquity, and is still, the main faith of the larger half of mankind. Above the commonalty of such spirits the primitive mind recognises higher spirits, or gods. Sometimes, by an extension of the natural order of life, the souls of great chiefs and warriors continue the same superior rank into the unseen world, and rise to divine honours. Was there a Pre-Animistic period? Some students hold that there was, and that then the causes of events were ascribed not to spirits, but to an impersonal power (*mana*, *orenda*, *wakonda*). Impersonal power, however, is an idea too abstract to have been reached by primitive man. In the most rudimentary stages of religion, ethical conceptions are but feebly developed, and there is little trace of moral retribution after death. The gods require their worshipper to perform his duty towards them, but do not necessarily concern themselves with his doing his duty to his neighbour. Yet the practical effect of religion on men's lives early begins to show itself. The worship of the dead naturally encourages good morals, for the ancestor who, while alive, saw that the members of his family did right by one another, and whose condition in the spirit-world is a continuation of his earthly character and rank, will naturally insist on this being continued when he is a divine ghost, powerful to favour or to punish. The world thus becomes regarded as the battle-ground of good and evil spirits, and from this follows naturally the idea of a dualism, or perpetual contest between good and evil, ranged under a supreme good and a supreme evil deity, which attains so great development in the ancient religion of Persia.

Animism, then, appears to the savage, on the evidence of his senses, to be a rational and fairly consistent philosophy, and it has maintained its place in higher civilisations. It is taught by Lucretius, when he makes his theory of film-like images of things (*simulacra* and *membrane*) account both for the apparitions which occur to men in dreams and the images which impress their minds in thinking; and when Democritus explained the facts of perception, by declaring that things are always throwing off images of themselves (*eidōla*), which enter the recipient soul, he was simply answering the fundamental question of metaphysics, by turning to a new purpose, as a method of explaining the phenomena of thought, the savage doctrine of object-

souls. Animism is not a degeneracy from a higher culture. In it we find no survivals which show inconsistencies with itself; whereas, in all higher cultures, there occur survivals of primitive superstition, wholly inconsistent with the more advanced beliefs. Most primitive superstitions are found surviving, in modified form, in poetry and folk-lore, and often in common words and phrases, which have a meaning deeper than metaphor. Animism is not itself a religion, but a sort of primitive philosophy, which not only controls religion, but the whole life of the natural man. It represents a stage in the religious evolution which is still represented by the so-called Nature-religions, or rather by the polydæmonistic magic tribal religions.

See Tylor's *Primitive Culture* (4th ed. 1903); Rush-ton M. Doorman's *Origin of Primitive Superstitions* (1881); books by Miss Kingsley (1897-99) and Lang (1887-1901); Frazer's *Golden Bough*; also APPARITIONS, DEMONOLOGY, DREAMS, HALLUCINATIONS, RELIGION.

Anio, the ancient name of the Teverone, a tributary of the Tiber, which joins the larger river 3 miles above Rome. Its beautiful cascade at Tivoli (the ancient *Tibur*) is celebrated by the classical poets. The purity of its water was celebrated, and from it Rome was from 270 B.C. supplied with water by means of two aqueducts.

Anion. See IONS, ELECTRICITY.

Anise (*Pimpinella anisum*), an annual plant of the natural order Umbelliferae. Two species are natives of Britain; they are commonly known by the name of Burnet Saxifrage, and have no properties of importance. Anise proper is a native of Egypt. It is cultivated in Egypt, Syria, Malta, and Spain, and even in Germany, especially in the district around Erfurt, where a large quantity of the seed is annually produced. Attempts were made, more than 200 years ago, to cultivate it in England; but the summers are seldom warm enough to bring it to perfection. It is occasionally sown in gardens for a garnish or for seasoning. Anise-seed (*aniseed*) is used as a condiment and in the preparation of liqueurs; also in medicine as a stimulant stomachic, to relieve flatulence, &c., particularly in infants. It has an aromatic, agreeable smell, and a warm, sweetish taste. Its properties are due to a nearly colourless or sometimes blue volatile oil, called *Oil of Anise*. *Anise-water*—water flavoured with the oil, and sugared—is much used in Italy as a cooling drink. The plant called anise in the New Testament is supposed to be *Peucedanum* (or *Anethum*) *graveolens* (see DILL).

STAR ANISE, or **CHINESE ANISE**, is the fruit of *Illicium verum*, a small evergreen tree of the natural order Magnoliaceae, somewhat resembling a laurel. It receives its name from the star-like form of the fruit, which consists of a number (6 to 12) of hard, woody, one-seeded carpels. It is held in high estimation by the Japanese, and planted near temples. The whole plant is carminative, and is used by the Chinese as a stomachic and as a spice in their cookery. The qualities of the fruit, seed, and oil closely resemble those of the common anise, and the oil is imported for the same purpose. Star aniseed is also imported, chiefly from China and Singapore.

Anjou, a former province in the NW. of France, of about 3500 sq. m. in extent, now forming the department of Maine-et-Loire, and small parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. It lies on both sides of the lower course of the Loire, where it receives the Maine. Its capital was Angers (Lat. *Andegavum*). The ancient inhabitants of Anjou were the *Andegavi*, who long and resolutely resisted the Roman arms. The first Count of Anjou was Fulk the Red, who was made count for his services against the North-

men in the 9th century. The male line of the ancient Counts of Anjou having become extinct in 1060, their title and possessions passed by the female line to the powerful House of Gatinais; and from one of this family, Geoffrey V., Count of Anjou, sprung the Angevin house of English kings, usually called Plantagenets, the last of whom was Richard II. Geoffrey conquered the greater part of Normandy, assumed the title of duke, and in 1127 married Matilda, the daughter of Henry I. of England, and widow of the Emperor Henry V. Through her, his son inherited the English throne, which he ascended in 1154 as Henry II. Anjou now became one of the possessions of the kings of England; but in 1205 the French acquired it by fortune of war; and it was bestowed as a fief upon Philip, the son of Louis VIII., and afterwards upon his brother Charles, who became the founder of that house of Anjou which gave kings to Naples and Sicily. Charles II. of Naples gave Anjou to his daughter Margaret on her marriage with Charles of Valois, the son of Philip IV. Her son ascended the throne of France as Philip VI. in 1328. King John in 1360 made Anjou a duchy, and gave it to his son Louis, and on his succeeding to the crown of Naples, it remained a possession of the kings of Naples till the overthrow of that dynasty under René II., when Louis XI. permanently annexed it to the French crown (1484). Subsequently it gave merely an honorary title to princes of the royal family—as, for example, the grandson of Louis XIV., who became Philip V. of Spain. Anjou was united with England for a short time during the reigns of Henry V. and Henry VI.—the latter king ceding it finally in 1444.

Ankarström, JOHN JACOB, the assassin of Gustavus III. of Sweden, born in 1762. The son of an officer of rank, he came very early to court as a page, and next entered the royal body-guard, but retired as early as 1783, and settled in the country. Being opposed to the measures taken by the king for curtailing the power of the senate and of the nobles, he became involved in certain intrigues in the island of Gothland, and was tried for treason, but released for want of positive evidence. Soon after he formed a plot with a ring of discontented nobles to murder Gustavus, and the lot to commit the dastardly deed having fallen on Ankarström, the old life-guardsmen wounded the king mortally with a pistol-bullet at a masked ball on the 15th March 1792. Ankarström was executed on the 27th April, after having been publicly flogged for three successive days.

Anker, a Dutch liquid measure, formerly often referred to in England, containing ten wine gallons.

Anklam, a town of Prussia, in the province of Pomerania, on the navigable Peene, 4 miles from its mouth in the Kleines Haff, and 41 miles SE. of Stralsund by rail. It has long been a place of commercial importance, having been a member of the Hanseatic League from the 14th to the 16th century. It has manufactures of iron, machinery, furniture, sugar, and soap, besides flour and saw mills. During the middle ages Anklam suffered sorely from fire and pestilence; and in the wars of the 17th and 18th centuries it was again and again besieged and sacked. In 1762 its fortifications were dismantled. The town contains many interesting specimens of Hanseatic architecture. Pop. 16,000.

Ankle. See FOOT, SPRAIN.

Anko'bar, old capital of the kingdom of Shoa (q.v.) in Abyssinia, is built 8200 feet above sea-level, and consists of 3000 huts scattered over a mountain. When the king was in residence the population increased from 6000 to near 15,000. It is at times practically a city of the dead.

Ankylo'sis (Gr. *ankylōsis*, 'bending' or 'crooking'; *ankylē*, 'stiff-joint') is a term used in surgery to imply a stiffness in any joint. It is usually the result of disease, which destroys either the articular cartilages, leaving two bony surfaces opposed to each other, to become united by subsequent formation of bony or fibrous tissue, or thickens and shortens the natural fibrous tissues around the joint. Severe injury may also lead to a similar result. If the bond of union be osseous, the joint is perfectly rigid; if fibrous, it may allow a certain amount of motion. Some joints, especially the elbow, are very apt to become ankylosed; and in the knee or hip-joints, osseous ankylosis, with the limb in a proper position, is frequently the most favourable termination to disease, as the limb can then afford a rigid support for the trunk. Joints, stiff through a fibrous ankylosis, may be forcibly bent, and the bond of union ruptured, so as to restore mobility, or allow of their being placed in a convenient position. In some joints, especially the elbow, ankylosis may be remedied by excision of the joint. Ankylosis of the joints between the vertebrae is common in advanced age; and in rheumatoid arthritis universal ankylosis of all the joints sometimes takes place.

Ankylostomiasis, a formidable and widespread parasitic disease in man, due to a small nematode in the duodenum and small intestine. It is perhaps the most important worm-parasite in man. The parasites burrow in the walls, destroy the capillaries, and produce pernicious anæmia — e.g. miner's anæmia. The fertilised eggs pass from the intestine, and develop in damp earth; the larvæ pass in by the mouth or bore their way rapidly through the skin. The European species, *Ankylostomum duodenale*, has been disseminated in America, Africa, and Asia; the Asiatic and African species, *Necator Americanus*, has now become common in America.

Ann, or **ANNAT**. See **ANNATES**.

Anna, or **ANNE**, ST., according to tradition, wife of St Joachim, and mother, after twenty years of barrenness, of the Virgin Mary, the mother of Jesus. — Ste Anne d'Auray, in Brittany, is a famous place of pilgrimage; and Ste Anne de Beaupré, near Quebec, is its counterpart in the New World.

Anna, an Indian coin, value nominally 1½d. sterling, but always the sixteenth part of a rupee.

Annaberg, a town of Saxony, on the northern slope of the Erzgebirge range, 34 miles S. of Chemnitz by rail. It is situated 1800 feet above sea-level, in what was once a mining district; the surrounding hills containing silver, tin, cobalt, and iron. It has extensive manufactures of lace, silk ribbons, corsets, and buttons. The ribbon manufacture was introduced here by Protestant refugees from Belgium in 1590. The mining industry was important in the 16th century, and still lingered in the 19th. Population 17,000.

Anna Carlovna, regent of Russia during the minority of her son Ivan, was the niece of the Empress Anna Ivanovna (q.v.), and in 1739 married Anton Ulrich, Duke of Brunswick-Wolfenbüttel. Her son Ivan, born in 1740, was nominated by the Empress Anna as her successor; and Anna Carlovna proclaimed herself regent, but showed no capacity. A conspiracy took place in 1741; the infant Ivan was murdered; and Anna and her husband were imprisoned at Cholmogory. Here she died in 1746; while Anton was confined till his death in 1776.

Anna Comnena, a learned Byzantine princess, author of one of the most valuable of the Byzantine histories, was the daughter of the Emperor Alexius I. (Comnenus), and was born on December 1, 1083. She received the best education that

Constantinople could give, and early displayed a fondness for literary pursuits; but was also habituated from her childhood to the intrigues of the court; and during the last illness of her father, she entered into a scheme, which her mother, the Empress Irene, also favoured, to induce him to disinherit his eldest surviving son, John, and to bestow the diadem on her. Failing in this, she framed a conspiracy against the life of her brother (1118); and when her husband, Nicephorus Bryennius, a Byzantine nobleman, either from timidity or virtuous principle, refused to join in it, she passionately lamented that she had not been born a man, and upbraided him for having the soul of a woman. Her brother spared her life, but confiscated her property, which, however, he soon after generously restored. Disappointed and ashamed, she withdrew from the court, and sought solace in literature. On the death of her husband (1137), she retired into a convent, where she died in 1148. Her life of her father, entitled *Anna Comnena Alexiadis libri XIX.*, is full of professions of careful inquiry and a supreme regard for truth, the effect of which is weakened by 'the perpetual strain of panegyric and apology.' The style is characterised by an elaborate affectation of rhetoric. The best edition is that of Schopen and Reifferscheid (2 vols. 1839-78). See Oster's *Anna Comnena* (3 vols. 1868-71).

Anna Ivanovna, Empress of Russia, born in 1693, was the second daughter of Ivan, elder brother of Peter the Great. She married in 1710 the Duke of Courland, who died in the following year; and she obtained the duchy of Courland for her favourite, Biron (q.v.), a Courlander of low birth. The throne of Russia was offered to her by the Supreme Council on the death of Peter II. in 1730, on conditions which greatly limited the power of the monarchy, but which she soon broke. She declared herself autocrat, and suppressed an attempt of the nobles to establish a constitutional government; and her paramour, Biron, having determined to govern the nation as well as the empress, established a reign of terror through the land. He is said to have banished not less than 20,000 persons to Siberia; many were broken on the wheel. Prince Dolgoruki and others of the highest rank perished on the scaffold. Anna died in 1740, and left the throne to her grand-nephew, Ivan.

Annals. These were at first books which contained a record, in chronological order, of the principal events occurring in one or more years. The name is derived from the oldest historical documents of the Romans, the *Annales Pontificum*, or *Annales Maximæ*, the duty of drawing up which devolved upon the *Pontifex Maximus*; but these were all destroyed by the Gauls at the sack of Rome, nearly four hundred years before the time of Christ. After the second Punic War, the *Annales Gentium* and *Annales Consulares*, of families or individual public men, continued to be composed by educated members of the Roman laity, such as Fabius Pictor and Calpurnius Piso. At a still later period, the term was applied to any historical work that followed the order of time in its narrations, separating them off into single years — as, for instance, the *Annals* of Tacitus.

Annam, a territory along the east coast of Indo-China, between 10° and 23° N. lat., forming an empire which, since 1885, has been under a French protectorate. The names Annam and Cochinchina are sometimes used as interchangeable; sometimes the whole region is Annam, with Tongking (Tonquin) and Cochinchina as subdivisions; and conversely, sometimes Cochinchina has Tongking and Annam for its northern and southern

sections. Cochin-China was the name originally given by the early navigators to the whole coast from Siam to China. Annam, a name given by the Chinese in the 3d century A.D., was adopted by the Annamese as the official name for the whole country.

The French usage is to treat French Indo-China (with Hanoi as administrative capital) as including Annam, Cambodia, Cochin-China, Laos, and Tongking (Tonkin), with a total area of about 300,000 sq. m., and a total population of 20,000,000. Of this total, Annam has perhaps—with recent additions—over 60,000 sq. m., its pop. in 1920 being about 5,700,000. Annam lies between Tongking on the N. and Cochin-China and Cambodia on the S. On the W. the mountain-range bounding the Mekhong valley on the E. was till lately regarded as its frontier towards Siam. But after a controversy with Siam, ending in a treaty (1893) enforced by a French warship at Bangkok, the Mekhong was made the frontier with Siam, from Cambodia to 18° N. Annam accordingly now includes a large number of the hill-tribes, Mois or Khas, and Laos. The country, save on the coast and along the Mekhong, is mountainous; minerals are believed to abound; coal is worked near Turane. The mountains are covered with valuable timber, and the lower lands are extremely fertile. The chief productions are, besides rice and other cereals, cotton, cinnamon, sugar, tea, coffee, and tobacco. The chief ports are Turane (wholly under French control), Qui-nhon, and Xuan-day: Hué is the capital. The principal imports are rice, cotton cloths and yarns, opium, and paper, for the most part from China and Japan.

The other sections of French Indo-China are treated in separate articles (see CAMBODIA, COCHIN-CHINA, TONGKING; see also the articles on BURMA and SIAM). But as Tongking has been so closely associated with Annam, its physical geography may be mainly dealt with here. Tongking, with an area of about 46,000 sq. m., and over 6,000,000 inhabitants (mainly Annamites, with some Mois), falls into three distinct natural divisions—(1) the delta-land in the SE.; (2) the region of plateaus in the north; and (3) the forest region in the west. The Song-coi, or Red River (called Thao by the Annamese, and Hong-kiang by the Chinese), flows across the whole of Tongking from NW. to SE. The delta-lands formed at its mouth may be defined as a rough insular triangle, the apex of which is Son-tay, and its two sides, Song-dai on the south, and Song-can on the north, both issuing into the sea. Not far below Son-tay the Song-coi opens out at intervals into four leading branches, of which one is navigable for large ships. These main water-ways are connected by a network of subsidiary channels—many natural, some in part artificial. The delta-lands are all crossed by great embankments or dykes, hundreds of miles in extent, often 60 to 70 feet wide at the base, 20 to 30 feet high, and broad enough at the top for three carriages to drive abreast. The delta-lands are extremely fertile, yielding two harvests a year. This fertility is due to the red soil which is transported by the Song-coi (Red River), and which is rapidly enlarging the delta. Hanoi, a seaport when built by the Chinese in the 8th century, is now 70 miles inland. Now, too, there are populous agricultural villages where a few years ago fishermen cast their nets. The staple product is rice; but there are also grown pea-nuts, castor-oil, mulberry for silkworms, cotton, sugar-cane, spices, sweet potatoes, &c. The north of Annam is rich in minerals of all kinds, and there have been opened gold, silver, copper, tin, and salt mines, while extensive coal-fields have hardly yet been touched.

The mountains are covered with all kinds of useful woods.

Though Annam lies wholly in the torrid zone, yet the climate of Tongking is on the whole excellent. During the dry season, from September to April, the thermometer varies between 70° and 40° F. During the hot and rainy season, extending over the other six months, the thermometer seldom mounts from a minimum of 70° to beyond 100° F. On account of the moisture, however, the heats in June and July are sometimes almost intolerable. In the mountains of Annam, tigers, buffaloes, rhinoceroses, and elephants abound. Much fishing is carried on.

Inhabitants.—The Annamese are mainly of Mongoloid stock. The inhabitants of the mountains (Muong or wild people) are taller, fairer, and stronger than the inhabitants of the plain. The latter are small of stature, but well proportioned, indolent, but expert. Rice is their principal food; but, like the Chinese, they are omnivorous, and devour snakes, locusts, rats, and dogs. The Tongkingese display wonderful skill in building dykes. Yet at Haiphong, the Chinese have monopolised all the industries demanding skill and perseverance; and 'lazy as an Annamese' is a common proverb. The only good industries carried on in Annam are in lacquer and the finer metals. The manufacture of steel is unknown. Sericulture and silk-weaving are far behind the state attained by those arts in China. The dykes offer the most available roads, and the only two great high-ways are the route from Saigon through Hue to Hanoi, and by way of Bac-ninh and Lang-son to China; and the northern road from Hanoi to Son-tay and Hung-hoa. The speech of the Annamese is monosyllabic, like Chinese, from which they have borrowed many words. The Annamese written character was also derived at an early period from the Chinese alphabet. There is no Annamese literature distinct from the Chinese. The mass of the people worship tutelary spirits; Confucianism is in vogue with the more cultivated; the remainder adhere to Buddhism. There are besides about 420,000 Roman Catholics, descendants of emigrants from Macao and Japan (1624), and of Portuguese fugitives from Malacca.

Government.—The frame of government was of Chinese pattern, but in its operation was much harsher and ruder than its prototype. The emperor was absolute despot. Unless the actual monarch should have decreed otherwise, the succession passes to the eldest son. He is assisted by a council of ministers. Military service is obligatory on all men between the ages of 18 and 60; and they are so often called out that the field-work is left principally to women. The capital of the empire is Hué. The administration is now carried out by Annamese officials under French control. Since 1887 Annam has formed part of the Indo-Chinese Customs Union.

History.—Tongking and Cochin-China were, 214 B.C., conquered by China, and occupied by Chinese colonists. In 939 A.D. Tongking freed itself from the yoke of China, and in 1403 a war commenced, which in 1428 ended with Annam's independence of China, although the latter still maintained a nominal suzerainty. In 1517 the Portuguese came into the country, followed by the Dutch, who established a trading settlement in Hanoi. In 1789, by the aid of the French, the emperor of Annam united Tongking and Cochin-China under his rule. In 1858 a Franco-Spanish squadron stormed Touron, and next year Saigon likewise surrendered. In 1861 the whole province of Saigon submitted to France. Other provinces soon fell, and by the treaty of Saigon or Hué (1862) 'French Cochin-China' was established, and afterwards enlarged.

In 1870 Dupuis made a voyage up the Sang-coi as far as Yunnan; and in 1873, with 100 French soldiers, captured Hanoi. By commercial treaty (1874) with Annam, France secured the right of holding the delta-lands of Song-coi, and freeing them from pirates. Accordingly, in 1882, Major Rivière made himself master of Hanoi, and, notwithstanding the protests of China, Annam, by treaty on the 25th August 1884, acknowledged the suzerainty of France, and her right to regulate the relations of Annam with foreign powers, China included. After some conflicts with France, China also, by the treaty of Tien-Tsin, 9th June 1885, engaged to respect the new state of affairs introduced by France into Annam, and to sanction commercial relations between China and Tongking. Thus practically the whole of Annam, including Tongking and Cochinchina, has been made a dependency of France.

See French works on Annam and French Cochinchina by De Lanessan (1895), Barral, Barthélemy, Dupuis, Leguilière-Beaucherc, Neton, Jottand, and Russier and Brenier, English by A. Cunningham (1902).

Annamaboe, a small seaport town, protected by a strong British fort, on the Gold Coast of Africa, 10 miles E. of Cape Coast Castle. It has a good landing-place, and is a free port, but there is little trade. Pop. 5000.

Annan, a small seaport, and royal and parliamentary burgh, in Dumfriesshire, on the river Annan, near its entrance into the Solway Firth, 18 miles ESE. of Dumfries by rail. It is neat and well built; among the chief industries are tanning and bacon-curing. Edward Irving was a native; and Carlyle, as a schoolboy, led 'a doleful and hateful life' at the academy. The burgh united (till 1918) with Dumfries, &c., in returning one member to parliament. Pop. 4000.

Annandale. See DUMFRIESSHIRE.

Annapolis, a seaport of Nova Scotia, on an arm of the Bay of Fundy, 95 miles W. of Halifax by rail. Its harbour is large and sheltered, though somewhat difficult of entrance. Annapolis is the oldest European settlement to the north of the Gulf of Mexico, having been established, in 1604, by the French as the capital of their province of Acadia, under the name of Port Royal. Acadia was ceded to Britain by the French in 1713, when Port Royal changed its name in honour of Queen Anne, continuing to be the seat of government, till in 1750 it was superseded by the newly founded city of Halifax. A fire in 1921 destroyed about a third of the town, but the historic buildings were unhurt. Pop. 1000.

Annapolis, the capital of Maryland, U.S., stands on the south bank of the river Severn, 2 miles from its entrance into Chesapeake Bay, and 40 miles E. by N. of Washington by rail. It has an air of quiet seclusion, more like a European town than an American city. Among its edifices are an imposing state-house, St John's College (1789), a Roman Catholic seminary, a naval hospital (1871), and a United States naval academy, established in 1845. Pupils remain in this institution for four years, previous to examination and admission into the navy as midshipmen. Founded as Providence in 1649, Annapolis received its present name in honour of Queen Anne. Pop. 11,000.

Ann Arbor, a flourishing city of Michigan, capital of the county Washtenaw, on the Huron River, 38 miles W. of Detroit by rail. It was settled in 1824, and incorporated as a city in 1851. The state university, founded 1837, possesses good libraries, a notable observatory, laboratories and museums, and is organised in seven departments. There are several faculties, and, as in Europe,

examinations for degrees are conducted on work done out of class. The city has an active trade, and contains manufactories of carriages, furniture, paper, woollen goods, blinds, and ploughs. There are mineral springs and a hydropathic establishment. Pop. 20,000. A fourth of the inhabitants are of German descent.

An'ates, or FIRST-FRUIT, in the ecclesiastical law of England, meant the value of every spiritual living for a whole year, which the pope, claiming the disposition of every spiritual benefice within Christendom, reserved out of every living. This impost was at first only levied from persons appointed to bishoprics, but was afterwards extended to the inferior clergy. It was abolished in 1534, and in the following year the right to annates was annexed to the crown. The fund thus arising was administered for the benefit of the Church of England. It was transferred to the governors of Queen Anne's Bounty, and afterwards to the Ecclesiastical Commissioners. For the purposes to which it is now applied, see ECCLESIASTICAL COMMISSIONERS.

ANNAT, or **ANN**, in Scots law, signifies the half-year's stipend payable for the vacant half-year after the death of a clergyman, to which his family or nearest of kin have right, under an act of the Scottish parliament passed in the year 1672. It is a right that does not belong to the clergyman himself, but to his next of kin absolutely, and therefore can neither be assigned or disposed of by him nor attached for his debts.

Anatto, or **ANATTA**, also known in commerce as *Arnatto*, *Roucou*, and *Orleana*, is the reddish pulp surrounding the seeds of the *Bixa orellana*, a medium-sized tree growing in Guiana and other parts of South America. The fruit having been bruised and macerated with water, the juice is allowed to stand till the colouring matter subsides to the bottom (an operation hastened by the addition of vinegar), when it is strained and the residue dried. Sometimes fermentation is allowed to take place, when an article superior for dyeing purposes, but having a disagreeable odour, is produced. Anatto is used in the dyeing of cloth, to which it imparts a bright orange tint, of slight permanence, however; and it also enters into some bright-coloured varnishes. It is in the manufacture of butter and cheese that it finds its widest application, although its value in this respect is purely a sentimental one, depending on the taste for a high-coloured article. As met with in this country, it contains flour, chalk, and other foreign substances, which, however, can hardly be regarded as adulterants, being necessary to adapt the crude article to its various uses.

Anne, Queen of Great Britain and Ireland, and the last British sovereign of the House of Stuart, was born at St James's Palace, London, on 6th February 1665. She was the second daughter of James II. of England and VII. of Scotland (who at the time of her birth was Duke of York), by his first wife, Anne Hyde, the daughter of the famous Earl of Clarendon. When she was six years of age, her mother died; and her father soon after professed himself a member of the Church of Rome; but his daughters were educated in the principles of the Church of England, to which Anne always retained an ardent if not a very enlightened attachment. In 1683 Anne was married to Prince George of Denmark (1653-1708), an indolent and good-natured man, who concerned himself little about public affairs, and had as little capacity for dealing with them. Soon after her marriage, the wife of Colonel Churchill (afterwards the famous Duke of Marlborough) was appointed one of the ladies of her bed-chamber. As the queen

needed some one on whom she could lean, Lady Churchill speedily became her intimate friend, and acquired supreme influence over her, which she exerted in favour of her husband. In their correspondence with each other, Anne went by the name of Mrs Morley, and Lady Churchill by that of Mrs Freeman. During the reign of her father, Anne lived in retirement, taking no part in politics. On the landing of the Prince of Orange, she soon joined his party, the Churchills having decided on that step. She consented to the act by which the throne was secured to the Prince of Orange in the event of his surviving her sister Mary; but quarrelled with her sister about questions of etiquette, and was afterwards drawn into intrigues in which the Churchills were engaged, for the restoration of her father, or to secure the succession of the throne to his son. She even entered into a secret correspondence with her father. She was herself childless when, on the death of William III., on 8th March 1702, she succeeded to the throne. She had borne, indeed, seventeen children; but only one, the Duke of Gloucester, survived infancy, and he died in 1700, at the age of 11. The influence of Marlborough and his wife was most powerfully felt in all public affairs during the greater part of her reign. The strife of parties was extremely violent, and political complications were increased by the queen's anxiety to secure the succession for her brother. In so far as she had any political principles, they were opposed to that constitutional liberty to which she owed her occupancy of the throne. These principles and her family attachment tended to alienate her from the Marlboroughs, whose policy, from the time of her accession, had become adverse to Jacobitism, and who now, along with Godolphin, were at the head of the Whig party. The duchess also offended the queen by presuming too boldly and haughtily upon the power which she had so long possessed. In 1715 they parted, never to meet again. Anne found a new favourite in Mrs Masham, a cousin of the duchess, who herself had introduced her into the royal household. To Mrs Masham's influence the change of government in 1710 was in a great measure owing, when the Whigs were cast out, and the Tories came into office, Harley (afterwards Earl of Oxford) and St John (Lord Bolingbroke) becoming the leaders of the ministry. But, although concurring more or less in a design to secure the succession of the throne to her brother, the new ministers had quarrels among themselves which prevented its successful prosecution, and kept the poor queen in a state of constant unrest. She died 1st August 1714. The Elector of Hanover succeeded her as George I.—The public events of her reign belong to the history of Britain; but the union of England and Scotland, in 1707, may be mentioned in its personal relation to herself, as she was the last sovereign who reigned over these as separate kingdoms, and the first sovereign styled of Great Britain.—Queen Anne was virtuous, conscientious, and affectionate, more worthy of esteem as a woman than of admiration as a queen. Her reign was rendered illustrious by some of the greatest names, both in literature and science, which this country has ever produced.

See, besides the histories of England, books on her and her reign by Justin McCarthy (1902), Herbert Paul (1906), and F. F. W. Ryan (1909).

Anne Boleyn. See **BOLEYN**.

ANNE OF AUSTRIA, daughter of Philip III. of Spain, was born in 1601, and in 1615 became the wife of Louis XIII. of France. The marriage was so far from being a happy one, that the royal pair lived for twenty-three years in a state of virtual separation—a result due chiefly to the influence of

Cardinal Richelieu, whose fixed determination to humble the House of Austria led him to spare no means for alienating the affection of Louis from his queen. On the death of the king in 1643, Anne became queen-regent, but disappointed the parliament and the nobility, who had hoped to secure again their ancient authority, by choosing as her minister Cardinal Mazarin, under whose strong and skilful management the young king (Louis XIV.) came, on attaining his majority, into possession of a throne firmly established on the ruins of contending parties. The character of Anne had much influence in moulding that of her son. She had, however, no capacity for actually managing affairs, and on the death of Mazarin retired to the convent of Val de Grâce, where she died in 1666.

Annealing. When a slab of glass or metal is allowed to cool down rapidly from its melted state, the constituent particles near the surface become differently arranged from those in the interior. The molecules next the skin are in a different state of tension from those inside. Annealing is a process of slow cooling of a body from a high temperature, by which there is secured a more or less uniform arrangement of the particles or molecules throughout its mass. Glass is in this way made strong and able to resist changes of temperature. The mere dropping of a small angular fragment of some hard substance, such as flint, into a glass vessel before it is annealed, usually makes it fly to pieces. A still more striking example of the unstable nature of unannealed glass is seen in Prince Rupert's drops. These are drops of glass which have fallen in a melted state into cold water, and have assumed a tadpole-like shape. If the point of the tail of one of these be nipped off with the fingers, the whole of it will fall into dust with a loud explosion. This shows that whenever the skin is broken, the particles beneath it are acted on by a repellent force, and fly away from one another.

An annealing kiln or oven is usually of some length, and the glass vessels or sheets placed in it are raised to near their melting-points at its hottest portion, and then moved away at intervals to cooler and cooler parts of the chamber. It takes twelve hours to anneal wine-glasses, but much longer for large objects. Plate-glass requires to be two weeks in the kiln before it is properly annealed. Badly annealed glass shows itself in numerous ways. A basin of thick glass left in an ordinary room will sometimes break spontaneously during a cold night. Plates of glass placed, on account of their apparent strength, in floors to admit light to cellars, have occasionally cracked to pieces during sharp frost. Hot water, as is well known, often breaks tumblers.

Metals under various circumstances require to be annealed. Hollow ware of cast-iron, before it can be turned bright for tinning, must be softened by the annealing process. The old way of doing this was a rough and ready one. Large and strong iron pots which contained the ware were placed on gratings in the open air, and the whole covered over with coke, all interstices both within and without the pots being filled up with coal-dust, to prevent as far as possible the access of air. The coke was then fired and kept at a red heat for about twenty-four hours, after which the pile was allowed to cool. For many years, however, hollow ware has been annealed in an oven not much unlike that used for glass. Large iron-castings are kept covered up in their moulds, to prolong the time of cooling—sometimes with hot cinders—for a month or more. Like thick glass, these occasionally break spontaneously.

What are called malleable-iron castings are articles usually of limited size, made of cast-iron, which are afterwards annealed. They are covered over with powdered hematite ore, and subjected to

various degrees of heat for about ten days, when they become quite malleable.

Metals, when undergoing the process of rolling, hammering, or stamping, require annealing. In the manufacture of sheet-brass, the rolling, by which it is gradually reduced in thickness, makes it so hard that it has to be annealed several times during the operation. But in this case the annealing is conducted in a reverberatory furnace, and lasts only a few minutes. The sheet-brass is simply raised to a blood-red heat and then withdrawn, this being sufficient to restore the ductility of the metal. Articles made of brass and other metals by stamping, and particularly such articles as require many blows of the stamp to bring them into shape, are repeatedly annealed during the process. In the case of coins, as they receive only one blow of the coining-press, the metal blanks are annealed before they are stamped. A steel matrix, from which die-punches are impressed, being usually a work of much labour, is put through the annealing process after every few blows in the die-press. German silver, which is composed of three kinds of metal, is difficult to anneal from its tendency to crack in the process.

Annealing is also used in gold-beating, in wire-drawing, in nail-making, and many other arts. Tin, lead, and zinc are annealed by the use of boiling water, and steel tools by immersion in hot oil, both liquids being allowed to cool slowly. Many experiments have shown that steel boiler-plates and ship-plates are made stronger by immersing them in oil, or in melted lead, or by simply heating them to redness in a slow furnace, and afterwards covering them up with sand or ashes to prevent them cooling rapidly or unequally. Tempering has been called the inverse process of annealing.

Annecey, chief town of the French department of Haute-Savoie, at the north-western extremity of the Lake of Annecey, 22 miles S. of Geneva, and 25 miles NW. of Aix-les-Bains by rail. The Lake of Annecey, 1426 feet above the sea, is about 9 miles long; its waters flow by the Fier to the Rhone. Annecey was transferred with Savoy to France in 1860. It has tanneries and manufactures of linens, cotton-yarn, silks, straw goods, &c. The most remarkable buildings are the castle, once the residence of the Counts of Geneva, and now a barrack; the old bishop's palace; the cathedral (1523); the hôtel-de-ville, with a statue near it of Berthollet (q.v.) by Marochetti; and the modern church of St Francis, which possesses relics of St Francis de Sales. Here Eugène Sue died in exile. Pop. 15,000.

Annelida (Lat. *anellus*, 'a little ring'), a term due to Lamarck, and definitely applied by Cuvier to the higher red-blooded worms. The term is no longer generally used in classification, but where it does persist, it usually includes the three classes—Chaetopoda, Discophora, and Gephyrea. See WORMS.

Annexation is the adding or joining to a state of territory which was previously independent or in possession of another power. It is generally, though not always, the result of war. As important annexations in recent times may be mentioned that of Oudh in 1856, which was one of the causes of the Indian mutiny; that of Savoy by France after the war with Austria in 1859; that of Alsace-Lorraine by Germany in 1871; that of Bosnia-Herzegovina by Austria-Hungary in 1908; and that of Korea by Japan in 1910; and many changes in 1919-20.

Annobon, or ANNABON, the smallest of the four islands in the Bay of Biafra, belongs to Spain. Its volcanic mountains render it picturesque, and it is well wooded and fertile. Area, over 6 sq. m.;

pop. about 1400 negroes, professedly Catholics. They do little, and are dying out. There is some fishing. The island was discovered by the Portuguese on New-year's Day (*Anno Bom*) 1471.

Annonay (ancient *Annoniacum*), a town of the department of Ardèche, France, 37 miles S. of Lyons. The chief manufacture is that of paper; there are also manufactures of gloves, silk and cotton twist, and woollen cloths; and bleaching is carried on. The paper-mills of Annonay were established by the father of the celebrated aeronauts Montgolfier (q.v.), who were born here. The situation of the town is picturesque. Pop. 15,000.

Annual, a term applied to plants which complete the whole course of their development in one season, within which they germinate, flower, perfect their seeds, and perish, never to spring again from the same root. The whole duration of life in the plants thus designated is indeed generally much less than a year, and in temperate and cold climates falls within the brief period of the summer months. Some species are generally annual, and others generally biennial; but whether an individual plant is annual or biennial often depends upon the accidental circumstance of the season at which the seed germinates, and may therefore be artificially determined by the time of sowing. Peculiar circumstances also sometimes convert annual into biennial, or even perennial plants; and those which are mere annuals in one climate, are perennial or even shrubby in another—e.g. the Castor-oil plant. Most kinds of corn are the produce of annual grasses; some of which, however, as wheat, in certain circumstances, prove of longer duration. The *annuals* cultivated in our flower-gardens are very numerous; and many species, both native and foreign, are among our most beautiful flowers.

In Gardening, annuals are divided into three classes—viz. *hardy*, *half-hardy*, and *tender*. The last named are those which can only be cultivated in the temperature of a stove or greenhouse, and consist of such as the Cockscomb (*Celosia cristata*), the Melon (*Cucumis melo*), and many others. The half-hardy class consists of those kinds that, while they will flower and perhaps perfect their seeds in the open air, need the assistance of artificial heat and protection in the early stages of their growth. The China Aster (*Callistemma hortense*), Tobacco (*Nicotiana tabacum*), Drummond's Phlox (*Phlox drummondii*), and Marigold (*Tagetes*), are familiar examples of this class of annuals. The first named or hardy class is composed of those that may be sown in the open ground, and will germinate and flourish from first to last without any artificial protection or aid. Nemophila Lupine (*Lupinus nanus* and others), the Large-flowered Flax (*Linum grandiflorum*), Candytuft (*Iberis umbellata* and others), the various Godetias, Gilias, and the Rocket Larkspur (*Delphinium ajacis*), are well-known members of the hardy group. So hardy are many of these that they may be sown in autumn and bloom the following spring, thus greatly prolonging the enjoyment of the flower-garden, as these will last in bloom till the ordinary spring-sown plants come in.

Californian annuals are unquestionably the most valuable for those who must rely solely on hardy flowers for the adornment of their gardens.

Annual Register, a yearly record of public events, which was commenced in 1759, and has been continued to the present time. It was projected by Robert Doddsley the bookseller, and for nearly thirty years Edmund Burke wrote the survey of events. Indexes have been published at various periods, and the work is now published by Messrs Longmans. Preceding works of the same kind were Boyer's *Political State of Europe* (1711-39),

and the *Historical Register*, a quarterly (1716-38). A rival work, entitled *The New Annual Register*, was started in 1781 by Dr Kippis. It was edited after his death by Dr Morgan, and came to a close in 1825. The *Edinburgh Annual Register* (1808-27) had among its contributors Sir Walter Scott and Southey. Many of the larger almanacs and other annual publications at home and abroad contain a well-digested summary of the historical events of the preceding year.

Annals, the name given to a class of sumptuous books, much in demand during the first half of the nineteenth century, for Christmas, New-year, and birthday presents. They were usually illustrated with good engravings, and often contained prose and poetry by most of the best writers of the day. The first of them, the *Forget-me-not*, was begun in London in 1822. The following year, two others made their appearance, *Friendship's Offering* and *The Graces*, the latter containing a series of elegant poems on the Months by the Rev. Dr Croly. The *Literary Souvenir*, however, commenced in 1824 by Mr Alaric A. Watts, was the first really beautiful book of this kind, and after its appearance the annals became every succeeding year more and more attractive. It was followed by the *Amulet*, started by Mr S. C. Hall, and edited by his wife; the *Winter's Wreath*, a provincial annual; and the aristocratic *Keepsake*, commenced in 1827 by Mr Charles Heath, an eminent engraver. The last was published at a guinea, instead of the usual twelve shillings of former annals, and was throughout one of the most successful of its class. Its first editor was Mr W. H. Ainsworth, and among his successors were Lady Emmeline Stuart Wortley and the Countess of Blessington. In its second year, Scott refused the editorship at a salary of £800, but had £500 for a few contributions. The first volume of the *Book of Beauty*, begun in 1833, and long one of the best of the series, was written by Letitia E. Landon; its second and all succeeding issues by the Countess of Blessington. Other annals were the *Picturesque Annual*, *Hood's Comic Annual*, the *Children of the Nobility*, the *Juvenile Album*, the *Musical Bijou*, the *Drawing-room Scrap-book* (the last edited at first by Letitia E. Landon, afterwards by Mrs Howitt, and latterly by Mrs Norton), the *Juvenile Scrap-book*, the *Oriental Annual*, the *Historical Annual*, the *Gift*, and the *Token*; the last three, American productions. For several years, nearly £100,000 per annum was expended on the production of annals, and 150,000 copies of them were yearly sold. The sale of the *Forget-me-not* alone was at one time 20,000 copies. In 1829 no fewer than seventeen were published. In 1840 their number had dwindled to nine. From this time the demand for the annual steadily declined. Publishers no longer found them safe speculations, and gradually discontinued them. They dropped out, one by one, like spent rockets, from the literary firmament. The *Literary Souvenir* had been discontinued in 1834, after the publication of ten volumes. The *Forget-me-not*, the first in the field, saw its twenty-second year. The *Book of Beauty* and the *Keepsake* (of 1856) were the last of their race. Modern 'Christmas annals' are cheap collections of tales and poems, more or less copiously illustrated in black-and-white and in colour. To a different category belong the almanacs and year-books (*The Statesman's Year-book*, &c.), *Who's Who?* and *Hazell's Annual*.

Annuity is the term employed to describe a payment generally (but not necessarily) of uniform amount falling due in each year during a given term, such as a period of years or the life of an individual; and payable, either in one sum at the

end of the year, or by half-yearly or other instalments. Annuities differ from other investments in this, that the capital sum invested or 'sunk' in the purchase of the annuity is not returnable when the annuity ceases to be payable—a portion of it is, in fact, returned in each payment of the annuity. By thus sacrificing the capital, a larger income is obtained, and hence the purchase of a life annuity is resorted to by persons whose main object is to secure a competency for themselves. For example, a male aged 60, by paying £1000 to the government, can secure an annuity of £87, 1s. 8d. for the remainder of his life, while the same sum invested in consols at par would yield £25 only. Annuities are divisible into two classes: (1) *Annuities certain*—that is, for a fixed term of years, subject to no contingency whatever, and depending for their value simply upon the operation of compound interest; and (2) *Annuities contingent*—that is, annuities depending not merely upon the operation of compound interest, but also upon the continuance of some status, such as the life of a person, whose duration can only be estimated by the theory of probabilities, on the average of a large number of cases. The former class is dealt with under the article INTEREST; the theory of annuities certain being, in fact, a branch of the theory of compound interest.

The LIFE ANNUITY (which is generally meant when the simple term 'annuity' is employed) is the principal example of the latter class, and to it our remarks must be mainly directed. In scientific treatises on the subject, an annuity is always assumed, unless otherwise described, to consist of an annual income of £1, or more simply of 1, payable at the end of each year survived—the amount for any larger sum being easily derived therefrom. When, in addition, a proportion of the year's annuity is payable up to the day of death, the annuity is said to be *complete*—the ordinary annuity being sometimes, for distinction, referred to as a *curtate* annuity. By the Apportionment Acts, however, annuities are held as accruing from day to day, and therefore as apportionable or complete unless otherwise specified—the legal and the scientific practice being thus at variance in this respect. When the first payment is due in advance, the annuity is known as an *annuity due*; and on the other hand, when the first payment is not to be made until the expiry of a certain number of years, it is called a *deferred annuity*.

The honour of having been the first to place the calculation of life annuities on a scientific basis, by applying the doctrines of probabilities and of compound interest to a mortality table deduced from the recorded statistics of an actual community (Breslau), belongs to the celebrated astronomer royal, Halley. His monograph on the subject is printed in the *Philosophical Transactions* for January 1693. When Halley wrote, the Revolution government was endeavouring to complete the raising of a sum of a million sterling, by the issue of life annuities, offering 14 per cent. during the lifetime of any nominee, without restriction of age; thus appraising selected life-interests at only a trifle more than seven years' purchase. Notwithstanding the fact that Halley's table showed the life-interests of young nominees to be worth upwards of thirteen years' purchase, or nearly double the amount charged, money found its way but slowly into the national treasury. Adam Smith attributes this to the supposed instability of the government; but it may doubtless also be traced to ignorance or distrust of Halley's conclusions on the part of his countrymen. Certain it is, that at a much later period (1746), an issue of exchequer life annuities—again on ruinous terms, and without restriction of age—was left to be taken up mainly

by Dutchmen, who, being well informed on the subject of life contingencies through the writing of Kerseboom, nominated children, and mostly young females; while the English subscribers selected their nominees from either sex, and of any age, up to 50 or 60 indifferently.

In 1808 the National Debt Commissioners commenced the granting of life annuities, graduated according to age, on the basis of the Northampton table of mortality (see INSURANCE). Previous annuity transactions had resulted in heavy loss, and it might have occurred to those responsible for the new departure, that that loss was not likely to be retrieved by adopting a table which had been proved to yield a large profit when used as a basis for life-assurance premiums! Not until 1828, however, and after Mr Finlaison, the government actuary, had pointed out that the loss from the annuity business was advancing at the rate of £8000 per week, was the Northampton table abandoned. Shortly thereafter, new tables of annuities, deduced from the past experience of the government, and distinguishing between male and female lives, were issued. Since then, the rate of mortality prevailing among government annuitants has been twice re-investigated, so as to embrace the additional data accumulated. The existing rates for government annuities are deduced from tables issued in 1884. These tables embrace the further feature of giving effect to the superior vitality found to prevail among the lives at the date of the purchase of the annuities, as compared with that of the general body of annuitants of corresponding ages. The same tables are doubtless the most appropriate basis upon which life-assurance companies, and other institutions granting annuities, can construct their scale of charges. But while the government rates are based upon the assumption that only $2\frac{1}{2}$ per cent. interest will be realised on the investments, assurance companies can afford to assume a future rate of $3\frac{1}{4}$ or $3\frac{3}{4}$ per cent., while trusting, like the government, to the additional interest realised beyond the rate assumed proving sufficient to provide for the expenses of conducting the business. The following table gives examples of the rates of annuity, per £100 sunk, deduced from the new government annuity tables—the annuities being calculated as ‘complete,’ and payable by half-yearly instalments:

AGE.	MALE LIFE.		FEMALE LIFE.	
	$2\frac{1}{2}$ p. cent.	$3\frac{1}{4}$ p. cent.	$2\frac{1}{2}$ p. cent.	$3\frac{1}{4}$ p. cent.
40	£ s. d. 5 11 10	£ s. d. 6 7 2	£ s. d. 5 0 6	£ s. d. 5 15 5
45	6 1 3	6 16 5	5 9 1	6 3 9
50	6 13 4	7 8 4	6 0 7	6 15 1
55	7 10 0	8 4 9	6 15 8	7 10 1
60	8 14 2	9 9 0	7 16 10	8 11 2
65	10 6 11	11 1 10	9 6 5	10 0 10
70	12 10 11	13 6 0	11 9 8	12 4 6
75	15 11 8	16 7 2	14 6 1	15 1 1

The rates in the column headed $2\frac{1}{2}$ per cent. are those actually allowed by the government; while those in the column headed $3\frac{1}{4}$ per cent. may be taken as affording an approximation to the more favourable terms which may be obtained from various life-assurance offices in this country. A comparison of the two will show that at least past errors are not being perpetuated by the government.

The total sum paid by the government, in respect of annuities, in an average year considerably exceeds £1,000,000 sterling, while the corresponding sum paid by the assurance offices may amount to about £650,000. These two sums, however,

represent only a very small proportion of the total annuity interest of the country; for, not to speak of the various widows' funds and annuity societies, it has to be borne in mind that a very large amount both of real and of personal property in this country is held in life-rent.

There is another important practical aspect in which the subject of life annuities may be viewed. While the government and corporate bodies granting annuities rely upon the principle of averages for the satisfactory working out of their transactions, a purchaser of an isolated annuity must proceed differently. He requires to protect himself against the loss of his capital, through the early death of the annuitant, and this can only be done by effecting an assurance on the life of the latter, without which, the transaction becomes a speculation and not an investment. Suppose a complete life annuity of £50 to be offered for sale, and an individual to be willing to purchase it at such a price as will yield him 5 per cent. on his outlay; then the first thing he would require to ascertain would be the rate of premium at which the life of the annuitant could be assured. This being found to be, say, 3 per cent. per annum, the intending purchaser would next proceed to calculate the sum, X, the interest upon which, together with the premium to assure its return at the death of the annuitant, would amount to £50. Thus:

$$(5 + 3) \times X \div 100 = 50 \therefore X = 625.$$

The premium to assure £625 is £18, 15s., and the interest on £625 at 5 per cent. is £31, 5s., together making up the annuity of £50. It should be borne in mind, however, that the £625 being the total outlay, the sum that can be paid to the seller is only £606, 5s., being the former sum, less £18, 15s., the amount of the first premium which requires to be paid in advance to the assurance office.

Of other forms of contingent annuities, a single example may be given. With many widows' funds it is a rule that the widow ceases to draw her annuity if she marries again. The calculation of an annuity ceasing either at death or upon re-marriage leads to no theoretical difficulties; but in order to obtain satisfactory results, it is necessary to have carefully compiled statistics of the ratio of re-marriage among widows of various ages.

In the law of England, an annuity is the right to the yearly payment of a certain sum of money, which is charged upon the person or personal estate of the individual bound to pay it. If it is charged upon real estate, the burden is called a rent or rent-charge, and not an annuity. An annuity may be created for a term of years, or for the life or lives of any persons named, or in perpetuity; and in the last case, if granted to a person and his heirs, the annuity is reckoned among incorporeal hereditaments; because, although the security is personal only, the annuity will descend in the same manner as real estate. In 1854 the old statutes relating to annuities were repealed, and enrolment in Chancery of annuity deeds is no longer necessary to give them validity. But registration is necessary in the case of annuities charged on land.

In Scots law, an annuity, as such, may be charged on real estate as well as on personalty. In that system it has been simply defined to be a right to a yearly payment in money; and it may be created either by the payment of the sum of money in the form of a purchase, or it may be secured over land. In the latter case the creditor, in default of his annuity, may attach the land charged, claiming a capital sum out of the land sufficient to produce an annual interest equal to the annuity, until the expiration of the same. A like rule holds for the claim upon an annuity in bankruptcy. The instrument by which,

in Scotland, the annuity is constituted in either of the above forms is called a Bond of Annuity. The right to an annuity on the life of another descends to the heir of the creditor. The annuitant under a trust is entitled to have the trust kept up for security.

Annuity-tax, a local impost for the payment of the salaries of the Established clergy of the city of Edinburgh. It was first established on a limited scale by an act of the year 1661; and was extended in its sphere of operation by an act of the legislature as lately as 1809. It amounted at one time to 6 per cent. on the rents of houses and shops within the royalty. It was a peculiarity of this tax that the members of 'the College of Justice,' including the lawyer class generally, enjoyed an exemption from it, as a relic of an ancient privilege by which they were induced to reside and hold the courts of law in Edinburgh. The tax was reduced in 1860; and, under an act passed in 1870, it was redeemed by payment of £56,500 by the Corporation to the Edinburgh Ecclesiastical Commissioners.

An'nulet (Lat. *annulus*, 'a ring'), a term in Architecture for a small fillet or band which frequently surrounds a column, &c. The annulet, a ring, is a charge in Heraldry. See CADENCY.

Annuloida, Annulosa. See WORMS.

Annunciation, the tidings brought by the angel Gabriel to the Virgin Mary of the incarnation of Christ. Also the festival kept by the church, in commemoration of this event, on the 25th of March. The festival was instituted about the beginning of the 7th century, those sermons of Athanasius and Gregory Thaumaturgus in which it is mentioned being now rejected as spurious; and the earliest certain references to it occurring in the acts of the Tenth Council of Toledo (656), and of the Trullan Council (692). In England, the festival is commonly called Lady Day (q.v.). Among the Jews, this title is given to a part of the ceremony of the Passover.

The *Order of the Annunciation*, now the highest Italian order, was instituted in 1360 by Amadeus VI., Duke of Savoy, and in 1725 was made the first order of the kingdom of Sardinia. The king is always grand-master. The knights, who are not limited in number, must be of high rank, and already in the orders of St Mauritius and St Lazarus.

Annunzio. See D'ANNUNZIO.

Annus Deliberandi, in Scots law, was the period of a year allowed to an heir to deliberate whether he would accept the inheritance with the burden of his predecessor's debts. But by recent legislation the period is shortened to six months, so that at the end of that time the creditors of the deceased may proceed to attach the estate, whatever the heir may resolve to do. Since 1874 no heir is liable for debts beyond the value of the estate, and the annus has become unimportant.

Anobium. See BORER and DEATH-WATCH.

Anode (Gr. *ana*, 'up,' and *hodos*, 'a way'), a term (see ELECTRICITY) introduced by Faraday to designate the positive pole, or that electrode by which in electrolysis the current enters the electrolyte, or body being decomposed; as opposed to *cathode*, the negative pole. The same names are applied to the poles of vacuum tubes.

An'odyne (Gr. *an-*, 'not,' and *odynē*, 'pain'), a medicine used to assuage pain. Anodynes may act either on the nerves and nerve-terminations (aconite, belladonna, cocain, &c.); on the brain (chloral, Indian hemp); or on all these parts (opium, bromide of potassium). See ANÆSTHESIA, NARCOTICS, SLEEP.

Anointing. See BAPTISM, CHRISM, CORONATION, EXTREME UNCTION.

Anomalistic Year is the interval that elapses between two successive passages of the earth through its perihelion, or point of nearest approach to the sun. If the earth's orbit had a fixed position in space, this period would correspond with that of a sidereal revolution, or the time the earth takes after leaving any point of the heavens to return to it again; but the disturbing influence of the other planets causes the perihelion to advance slowly (11⁷/₈ annually) in the direction of the earth's motion; so that the anomalistic year is longer (4 minutes 39 seconds) than the sidereal. The length of the anomalistic year is therefore 365 days, 6 hours, 13 minutes, 49 seconds.

Anom'aly (Gr. *anomalía*, 'irregularity'), the angle measured at the sun between a planet in any point of its orbit and the last perihelion. It is so called because the first irregularities of planetary motion were discovered in the discrepancy between the actual and computed distance. The anomaly was formerly measured from the aphelion, the opposite point of the ellipse; but from the fact that the aphelia of most of the comets lie beyond the range of observation, the perihelion is now taken as the point of departure for all planetary bodies.

Anomodonts, an order of extinct reptiles, first found in the Permian and common in the Triassic, intermediate between labyrinthodont amphibians and monotreme mammals. They are mostly small, and are named from the anomalous dentition of the first discovered genera.

Anona. See CUSTARD-APPLE.

Anona'ceæ, the Custard-apple (q.v.) order, are archichlamydeous dicotyledons, mostly tropical trees and shrubs. Usually the fruit is succulent and delicious, but sometimes dry and pungent.

Anonym'ous (Gr., 'nameless'), a term applied to a book the author of which does not give his name; when an assumed name is given, the term PSEUDONYMOUS is used. Works of this class constitute one of the great difficulties of bibliography.

In Great Britain, till the foundation of the *Fortnightly* and *Contemporary Reviews* (1865-66), political articles were generally anonymous, as also was most of the literary criticism, till the starting of the *Academy* (1869). It is generally admitted that anonymity secures the independence of the critic, and enables him to write with greater freedom, vigour, and power; but it is true that he often abuses his advantage, and gratifies under the veil of the anonymous his own personal pique. The article on 'the fleshly school of poetry' in the *Contemporary Review* for October 1871, which drew upon its author such merited castigation from Dante G. Rossetti in his famous letter to the *Athenæum* on 'the stealthy school of criticism' (December 16, 1871), was an example of an attempt to preserve anonymity even in a magazine where the articles were signed—its author, Robert Buchanan, having used the pseudonym of 'Thomas Maitland.' Perhaps the most intolerable abuse of anonymity is the anonymous letter, which, even when the writer is known, is legally punishable only in so far as it is slanderous or comes under the law of Libel (q.v.). See Barbier's *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (Paris, 1806, 3d ed. 1872-79), which embraces the titles of about 24,000 works, with the names of those who are assumed or known to be the authors. Other lists of anonymous and pseudonymous literature will be found in the indexes to *Notes and Queries*; in 'Olphar Hamst's' *Handbook of Fictitious Names* (1868); Cushing's *Initials and Pseudonyms* (New York, 1885), with his companion volume, *Anonyms* (1887), comprising the titles of 20,000 books and pamphlets, and authors' names; and Halkett and

Laing's *Dictionary of Anonymous and Pseudonymous Literature* (4 vols. 1881-1887). The standard German work is Holtzmann and Mokatta's *Deutsches Anonymenlexikon* (1902-3).

Anopheles. See GNAT, MALARIA.

Anoplotherium, a genus of extinct Artiodactyla, established by Cuvier from bones in the gypseous strata of the Oligocene formation near Paris. They are found also in the Isle of Wight and elsewhere. The teeth differ from those of all other Ungulates, extinct or recent. There are six incisors, two canines, eight præmolars, and six molars in each jaw—the dental formula thus agreeing with that of the fossil genus *Palæotherium* (q.v.); but the teeth are arranged in a continuous series without intervening vacancies—a circumstance very remarkable, as it does not occur in any existing quadruped, but now appears in man alone. The molars of the upper jaw have quadrate crowns; those of the lower are marked with a double or triple crescent of enamel, which forms prominent ridges. In some respects, the teeth resemble those of the rhinoceros, and exhibit generalised selenodont characters—that is to say, the teeth are crescentic, like those of the Ruminants (q.v.), or ruminating quadrupeds, between which and the non-ruminant Artiodactyla the *Anoplotherium* has been thought to form a connecting

Anoplotherium.

link; but in some of the species originally included in this genus, and which are now sometimes ranked along with it under the name *Anoplotheroids*, the teeth exhibit peculiarities which have led to the supposition that their food may not have been exclusively vegetable. The snout is not much elongated, and it is evident that there was no proboscis. The feet are terminated by two toes, as in the Ruminantia; but they have always separate metacarpal and metatarsal bones, not a single *canon* bone. Several species of *Anoplotherium* have been determined—the size of the animal being about that of the ass. Closely allied to *Anoplotherium* are certain other genera, of which *Dichodon* and *Dichobune* are the most important. These, with *Anoplotherium*, form the family of the *Anoplotheriidae*.

Anquetil, LOUIS PIERRE, a French historian, born at Paris in 1723, took orders, and, after filling educational posts at Rheims and Senlis, got a government appointment under Napoleon. He died, a member of the Institute, at Paris, September 6, 1806. He wrote a history of Rheims, and numerous memoirs on periods of French history; but his great work is his *Histoire de France* (14 vols. 1805), continued by Bouillet to 1862 in 6 additional volumes.

Anquetil-Duperron, ABRAHAM HYACINTHE, brother of the preceding, a French orientalist, was born at Paris, December 7, 1731. He first studied theology, but finally devoted himself to oriental languages, and such was his passion for this study that he enlisted as a private soldier for India at twenty-three in order to gratify it. The government having been made aware of this proof of the scholar's ardour, made him an allowance so as

to enable him to proceed independently. After an extensive journey in India, he fixed his residence at Surat, where he gained an intimacy with the Parsee priests, and obtained from them manuscripts of the Zend-avesta and the later Persian religious books. After the fall of Pondicherry (1761), he returned to Europe, carrying with him nearly two hundred manuscripts, and soon obtained through the influence of the Abbé Barthélemy a situation in the Bibliothèque Royale. His *Zend-avesta, ouvrage de Zoroaster*, appeared in 1771, and being the first translation ever made into a European tongue, attracted much attention. This translation has long been superseded, as it was made, not from the original, but from the more or less inaccurate Persian translation of his Indian teacher. Another important work is his *Oupnek'hat* (1801-2), a Latin translation of two manuscripts which contained an old Persian version of the chief Indian *Upanishads*. It was from this translation that Schopenhauer drew that intimate acquaintance with Indian philosophy which influenced his own system so profoundly. Anquetil-Duperron died at Paris 17th January 1805.

Ansars, or NOSAIRIS, an Arab sect in the hill-country north of Lebanon, also now in the plain, at Antioch, at Tripoli (in Syria), and in Cilicia. They may be named from Mohammed ibn Nosair in the 9th century; though Dussaud in his great work on them (Paris, 1910) thinks the name is a corruption of Nassiâri, 'Nazareans,' because of the admixture of Christianity and Gnosticism with their Shiite Mohammedanism and old Syrian nature-worship. (See DRUSES for another eclectic Syrian sect.) First heard of in the 10th century, they not merely reverence Ali, the nephew of Mohammed, but practically deify him, and pay divine honours to his sons or emanations, thus recognising a kind of Trinity. They believe in a Mahdi or Messiah to come, the twelfth and last of the imams or emanations of the divine spirit, and they keep secret their religious rites and grades of initiation. They have special religious books; in their prayers they turn towards the rising and the setting sun; they believe in a constant transmigration of souls, which for the faithful is a process of purification until they reach at length the higher and more perfect states of earthly life, and find places as brilliant stars on the horizon. Those, however, who have derided or made known the sacred mysteries, or who have denied the divinity of Ali, are doomed to death, or are transmigrated into Jews, Christians, or Mohammedans, or into dogs, swine, and asses. The Ansars often defended their freedom with bravery against the Turks. The name Ansars was also applied to the first adherents of Mohammed.

Ansbach (in England often ANSPACH), a town of Bavaria, on the Rezat, 25 miles SW. of Nürnberg. It has manufactures of furniture, buttons, bricks, woollen-yarn, lace, gold embroidery, beer, chicory, tobacco, and cigars; as well as straw-plaiting and iron-founding, and a brisk horse and cattle market. The situation is pleasant, but there are no remarkable buildings, except the deserted palace of the former margraves of Ansbach, surrounded by gardens, and the church of St Gumpert, said to occupy the site of a church erected in the 8th century. The margraves of the old principality of Ansbach were a branch of the family of Hohen-zollern. The last of them gave up his possessions in 1791 to Prussia; and in 1807 Napoleon transferred Ansbach to Bavaria. Pop. 20,000.

AnsdeU, RICHARD, animal and landscape painter, was born at Liverpool in 1815. Abandoning business for art, he exhibited at the Royal Academy in 1840, and at the British Institute in 1846. A visit to Spain with John Phillip in 1856

led to a series of Spanish subjects. He thrice won the Heywood Medal at Manchester, and a gold medal at the Paris Exhibition of 1855. He was elected A.R.A. in 1861, and R.A. in 1870. He died 20th April 1885.

Anselm OF CANTERBURY, a scholastic philosopher, was born at or near Aosta, in Piedmont, in 1033. At the age of fifteen, Anselm ardently desired to enter the monastic life, but his father sternly refused his consent. After his mother's death, he resolved to escape from his father's oppression, and to seek a career across the Alps. Here he spent three years in Burgundy, and being attracted by the reputation of Lanfranc, he went in 1060 to study at the monastery of Bec, in Normandy. Three years after, he succeeded his master as prior, and in 1078 became abbot of this monastery, the most famous school of the 11th century. Lanfranc, who in the meantime had gone to England, and become Archbishop of Canterbury, died in 1089; and the diocese remained four years without a successor, till in 1093 Anselm was appointed. He was distinguished both as a churchman and a philosopher. His numerous embroilments with William Rufus and his successor, and the unbending spirit which he displayed in these, even when subjected to banishment, indicate the vigour and resoluteness of his character, as much as his writings exhibit the depth and acuteness of his intellect. Exiled by Rufus, Anselm returned at Henry's urgent request; but the new monarch's demand that he should renew his homage, and be again invested with his archbishopric, was met with an absolute refusal, and led to a second exile of two years' duration. In 1105, however, Anselm's threat of excommunication led to the reconciliation of king and prelate, and the compromise was devised which, in 1122, was accepted by pope and emperor at Worms (see *INVESTITURE*). Anselm was a second Augustine, superior to all his contemporaries in sagacity and dialectical skill, and equal to the most eminent in virtue and piety. Embracing without question the doctrines of the church, mostly as stated by Augustine, and holding that belief must precede knowledge, and must be implicit and undoubting, he yet felt the necessity of a religious philosophy, urged the duty of proceeding from belief to knowledge, and sought to reduce the truths of religion into the form of a connected series of reasonings. It was for this purpose he wrote his *Monologion*. In his *Proslogion*, he strove to demonstrate the existence of God from the conception of a perfect being, as Descartes also subsequently did. His *Cur Deus Homo* (Eng. trans. by Prout, 1887) argues the necessity of the Incarnation, all subsequent speculation on which it has profoundly influenced (see *ATONEMENT*). Besides his philosophical treatises, his *Meditations* and *Letters* have come down to us, revealing his humble fervent faith, and the tender sympathy of his nature. He died April 21, 1109, and was buried next to Lanfranc at Canterbury. In 1494 he was canonised, but Dante had long before placed him among the greatest saints in paradise. In 1720 Clement XI. expressly placed him in the list of church authorities.

See Rémusat's *Anselme* (1853; 2d ed. 1868); Dean Church's *Anselm* (1870); *Life and Times of St Anselm* (2 vols. 1883), by Mr Martin Rule, who edited for the Rolls Series Eadmer's two lives of Anselm (1884); books on him by Rigg (1897) and Welch (1901); and the translations from Anselm by S. N. Deane (*Cur Deus Homo* and other pieces, 1903) and others. See also the articles SCHOLASTICISM, WILLIAM II.

Anser. See GOOSE.

Ansgar (*Anscharius*), the Apostle of the North, was born in Picardy in 801. Under the patronage

of Louis le Débonnaire, he went, with his colleague Autbert, to preach Christianity to the heathen Northmen of Sleswick. He suffered many persecutions; but had nevertheless such success that, in 831, the pope established an archbishopric in Hamburg (transferred to Bremen in 847), and Ansgar was appointed the first archbishop. He made several missionary tours in Denmark and Sweden, and died in 865 at Bremen. See his *Life* by Tappehorn (Munst. 1863).

Anson, GEORGE, LORD ANSON, born 23d April 1697, at Shugborough Park, Staffordshire, entered the navy in 1712, and was made a captain in 1724. In 1739, on the outbreak of war with Spain, he received the command of a Pacific squadron of six vessels, with instructions to inflict whatever injury he could on the Spanish commerce and colonies, and he sailed from England in September 1740. Vessels, crews, and stores were alike indifferent; yet, in spite of all disadvantages, he achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. With only one ship, and less than two hundred of his original followers, but with £500,000 of Spanish treasure, he returned to Spithead, June 15, 1744, having circumnavigated the globe in three years and nine months. His perilous cruise greatly extended the knowledge of navigation and geography. As a reward for his services, Anson was made Rear-admiral of the Blue (1744); and in 1747, having utterly defeated the French admiral Jonquière, off Cape Finisterre, and captured £300,000, he was made Baron Anson of Soberton, and, four years later, First Lord of the Admiralty. In 1761 he received the high dignity of Admiral of the Fleet. He died at his country seat, Moor Park, Hertfordshire, 6th June 1762. Few works have been so popular as Anson's *Voyage round the World* (1748), of which, whether edited by Walter or Robins, he himself was virtually the author. See his *Life* by Sir John Barrow (1839), or that by Captain W. V. Anson (1912).

Ansonia, a city co-extensive with Ansonia town, New Haven county, Connecticut, lies on both sides of the Naugatuck River, 2 miles above its confluence with the Housatonic, and 12 miles W. of New Haven by rail. It has manufactures of iron, brass, and copper goods, clocks, electrical goods, webbing and knit goods, carriages, and hardware. Pop. 18,000.

Anspach. See ANSBACH.

Ansted, DAVID THOMAS, geologist, born in London, February 5, 1814. After gaining a fellowship at Jesus College, Cambridge, he devoted himself to geology under Sedgwick, in 1840 was appointed to the chair of Geology in King's College, London, and was elected F.R.S. In 1845 he became attached to the Indian military school at Addiscombe, and the college for civil engineers at Putney. From this time until his death, through a carriage accident near Woodbridge, in Suffolk, May 13, 1880, he devoted his studies to the economic applications of geology, and was much consulted in great mining and engineering operations. His works on his chosen subject were numerous and popular.

Anstey, CHRISTOPHER, born in 1724, was educated at Bury St Edmunds, Eton, and King's College, Cambridge, of which he was a fellow from 1745 to 1754. In 1766 he published the *New Bath Guide*, whose fun and humour—somewhat faded now—achieved a success approached by none of his subsequent poems. He died in 1805.

Anstruther, EASTER and WESTER, two contiguous royal burghs on the coast of Fife. 9 miles south of St Andrews. Fishing and fish-curing are the staple industries, the harbour (1866-77) being at Cellardyke. East Anstruther was the birth-

place of Dr Chalmers, Tennant the poet, and Goodsir the anatomist. With the other St Andrews burghs, they returned a member to parliament till 1918, when they were merged in the county. Joint pop. 1600; with Kilrenny, 3600.

Answer, in music, is the repetition by one voice or instrument of a theme proposed by another.

Ant. Ants (*Formicidæ*, *Myrmicidæ*) are a group of Hymenopterous insects, in the same order as wasps and bees, which they resemble, not only in general structure, but in the high evolution of their instinctive habits and social life. The word 'ant' is contracted from the old-fashioned Saxon word *emmet*; and 'pismire' is another almost obsolete term. The white ants or Termites (q.v.) are members of an entirely different order—Neuroptera. The ant family is represented by between two and three thousand different forms, widely distributed in temperate and tropical countries. Several sub-families are distinguished: (1) Ponerinæ, in which the workers always have a well-developed sting; (2) Dorylinæ, in which the worker's sting is sometimes vestigial; (3) Myrmicinæ, in which the workers have a sting; (4) Dolichoderinæ, in which the sting is usually vestigial; and (5) Camponotinæ, in which the sting is a vestige which serves to support the orifice of the poison-sac. Many fossil ants are known from Tertiary amber.

Different Forms.—Like most bees, ants occur in three different forms—(a) the perfect females or queens, the mothers of new generations; (b) the short-lived males, which die soon after the 'nuptial flight'; and (c) the great majority of workers, which are predominantly females, though rarely sexual, and often exhibit different forms according to the work which they have to do. In some cases, further, there are distinct classes of workers.

Structure.—As in other insects, the body consists of three parts—head, thorax, and abdomen. The head, which of course contains the 'brain,' is, though minute, yet large in proportion.

Life-history.—As in many other insects, there are four chapters in the life-history of an ant—viz. egg, larva, chrysalis, and perfect insect. The

after a period varying from a few weeks to as many months, become pupæ or chrysalids. These may remain naked, or may spin silken robes or cocoons. The nursing care of the workers does not cease; the brood is kept clean, shifted into the sunshine, or carried off in case of danger. Ant pupæ are collected and sold both in this country and on the Continent as food for young birds. After a short while, during which no food is taken, the perfect insects appear, weak and helpless, still dependent upon the kindly aid of the workers, even to free them from their silken birth-robes. For some weeks, in fact, the workers continue to care for them. As in all insects with a similar history, or complete metamorphosis, the insect has attained its full size when it leaves the pupa stage. Left to themselves, the males generally die after fertilising the queens in the nuptial flight, but the queens and workers may live for several years. Great numbers fall victims to other animals—insects, spiders, birds, ant-eating mammals, &c.; and, small as they are, ants are not unfrequently attacked by still smaller parasites.

Food.—The whole food-supply for the inmates of the nest is collected by the industrious workers, or in a few cases by captured slaves of another species. The food chiefly consists either of insects and available animal matter, or of sweet vegetable substances, such as honey, fruit, and sugar. In the Honey Ant, described by M'Cook (see fig. 4), the abdomen is enormously distended with honey, which is forcibly injected by the normal workers, and is afterwards utilised for the young brood. When the honey exudes by accident, it is greedily lapped up by the workers, but if the honey-pot die, both corpse and honey are buried. The squeezed-out honey is said to be sold in Mexican markets as the basis of a drink resembling mead. The harvesting or grain-storing habit, often alluded to in ancient literature, and remaining unquestioned in popular belief, was for a long time regarded with considerable scepticism by scientific investigators. It was questioned in 1747 by the Rev. W. Gould, one of the early students of ants in Britain, and such authorities as Latreille and Huber believed his hesitation to be thoroughly justified. The barleycorn-like pupæ cocoons suggested the possibility of mistaken observation, while the torpor of ants during the winter of northern countries did not consist with any storing habit. Yet the opinion of the ancients was expressed in unmistakably circumstantial language, as in this regulation as to ant-granaries found in the Mishna: 'The little caves of ants, when in the midst of a standing crop, are adjudged to the owner of the field; of those behind the reapers, the upper part is the property of the poor, the lower of the proprietor.' The opinion of the ancients has been amply confirmed. Thus in 1829 Lieutenant-colonel Sykes noted at Poonah the large heaps of millet-seed stored up by a species of ant which he named *Atta providens*. The same was demonstrated by Mr Moggridge in regard to some ants in the south of Europe, while Dr M'Cook has given a most graphic account of the harvesting habits exhibited by the agricultural ants of Texas. Moggridge also noted that the seeds are somehow prevented from germinating, but if the process should in exceptional cases begin, the ants are clever enough to eat off the radicle.

Ants are especially fond of the sweet secretion which flows out from the plant-lice or Aphides (q.v.); and some species not only tap and tickle the latter to induce them to part with their honey-dew, but keep them, as Linnæus said, as 'cows,' protecting them in sheds, and yet more marvellously caring for their eggs. Several breeds

Fig. 1.—A Common Ant (*Lasius flavus*): a, queen; b, worker; c, male; d, larva; e, pupa. (After Lubbock.)

minute white or yellowish eggs laid by the queen in the ant nest, are hatched in from two to six weeks, and develop into white legless larvæ or grubs. Both eggs and grubs are carefully watched, and the grubs fed, by the ever-vigilant workers. Thanks to the abundant food-supply, which is given them in a prepared form, the larvæ increase greatly both in size and in complexity, and

of aphid 'cows' are thus appropriated and utilised, and apparently regarded by these pastoral ants as distinctly their 'property,' for the possession of which, if need be, they will even fight. Other insects are sometimes similarly utilised. Several naturalists, such as Bates and Belt, have given vivid accounts of the ravages of the Drivers and Hunting Ants. 'The dread of them is upon every living thing. Their entrance into a house is soon known by the simultaneous and universal movement of rats, mice, lizards, cockroaches, and vermin of all sorts. When they are fairly in, we give up the house, and try to await with patience their pleasure, thankful indeed if permitted to remain within the narrow limits of our beds and chairs.' 'Wherever the marauding Ecitons move,' Bates says, 'the whole animal world is set in commotion, and every creature tries to get out of the way. The main column of the army, from four to six deep, moves forward in a given direction, clearing the ground of all animal matter dead or alive, and throwing off, here and there, a thinner column to forage on the flanks.' The blind driver ants of Africa (*Anomma*) are perfect nomads, overcoming every obstacle in their blind march, and even forming 'animated suspension-bridges' over broad streams. Though useful as scavengers, their unchecked multiplication may result in ravages very much the reverse of beneficial. More than a hundred years ago, vast hordes of *Formica saccharivora* appeared in the island of Grenada, and did the greatest damage to the sugar plantations. 'They descended from the hills like torrents, and the plantations, as well as every path and road for miles, were filled with them. Rats, mice, and reptiles of every kind became an easy prey to them; and even birds, which they attacked whenever they lighted on the ground in search of food, were so harassed, as to be at length unable to resist them. Streams of water opposed only a temporary obstacle to their progress; the foremost rushing blindly on certain death, and fresh armies instantly following, till a bank was formed of the carcasses of those which were drowned, sufficient to dam up the waters, and allow the main body to pass over in safety. Even fire was tried without effect. When it was lighted to arrest their route, they rushed into the blaze in such myriads as to extinguish it.' A reward of £20,000 was offered in vain for an effectual means of destroying them; but in 1780 a hurricane which tore up the canes, and exposed their habitations to a deluge of rain, freed the island from this plague. In reference to their food-acquiring habits, ants may be classified as hunting, pastoral, and agricultural—'three types,' as Lubbock remarks, 'offering a curious analogy to the three great phases in the history of human development.'

Nests.—Most ants live in chambered nests. These are of very varied construction, from simple heaps of loose material to houses of more or less elaborate architecture. Some simply utilise the shelter of a large stone, under which they burrow, while others weave a hanging silken nest; some bore into old stumps, which they riddle with their tunnels, and others form a home from leaves glued or woven together. The common yellow ant, *F. flava*, makes an underground nest, which looks like a little grassy mound, perforated by innumerable passages, and sometimes a foot in height. The nest of *F. rufa* is often twice as large, and exhibits a thatched dome, with lattice-work shutters and doors which are closed at night. In South America, the ant-hills are sometimes several feet in height, and exhibit internally a marvellously complex and orderly arrangement of chambers and galleries. The so-called 'mason-ants' use soft

clay in forming the roofs and partition of their neat chambers, while the 'carpenters' hollow out their houses in trees and shrubs. *F. flava* forms its partition-walls of a sort of papier-mâché of

Fig. 2.—Part of a Gallery, with Ant working on tiptoe: *Pogonomyrma mollicans*, the Agricultural Ant of Texas. (From M'Cook.)

sawdust, earth, and spider's web. *F. smaragdina*, an East Indian species, forms its nest of a thin silk-like tissue. *F. bispinosa*, in Cayenne, makes a felt of the down which envelops the seeds of the *Bombax carya*; while an East Indian species, *Myrmica kirbyi*, forms a globular nest of a congeries of tile-like plates of cow-dung. *M. nidificans*, in Malabar and Malacca, forms a nest of some papery material which it fixes on a leaf; and the 'umbrella' ant of Brazil was said by Bates to thatch its large mansion (sometimes 40 yards in circumference and two feet in height) with circles of leaf 'cut with accurate precision from coffee and orange trees, which they oftentimes strip bare to carry out their bold architectural designs.' Belt has, however, noted that, in Nicaragua at least, the leaves are stored until they decay and become covered with a fungus which forms the food of the ant. Roads, tunnels, and covered ways are

Fig. 3.—Ant's Nest (a mound disc) with Roads: *Pogonomyrma mollicans*, the Agricultural Ant of Texas. (From M'Cook.)

also frequently formed round about the nests for safe and convenient transit. Many communities, sometimes including alien lodgers, may live within the bounds of a large nest, and a single community may contain more than half a million members.

Sexes.—As has been already noted, an ant's nest contains three kinds of individuals—the crowd of workers, the short-lived males, and one or more queen-mothers. The workers are really imperfect females, and besides the queens, some species include a third form of female. Though the queens are the real mothers, Lubbock has proved that in most nests there are a few fertile workers, but their eggs, if they develop at all, seem always to produce males. It is generally supposed that the ants are able, like bees, to determine, by differences of food, &c., whether a given egg will develop into a worker or a queen. In the course of summer, when external conditions are favourable, the winged males and young queens leave the nest in a marriage-flight, during which fertilisation is effected. The columns of myriad insects, rising like smoke, and glittering in the sun, attracted attention long before they were understood.

'Each column looks like a kind of slender network, and has a tremulous undulating motion. The noise emitted by myriads and myriads of these creatures does not exceed the hum of a single wasp. The slightest zephyr disperses them.' During this flight many fall victims to the elements and living enemies. It is still doubtful how the new nests are generally founded, but Lubbock has shown that an isolated queen-ant is capable of giving origin to a new community, while it appears that in other cases an old-established nest may adopt a fresh queen, secured by the workers when she falls near the nest from her marriage-flight. Several queens may reign together in one nest, and they are always treated with a loyal devotion, associated, however, with a judicious measure of control. The Rev. W. Farren White quotes the following interesting passage from Gould, who has been already referred to as one of the early students of British ants. 'In whatever apartment a queen condescends to be present, she commands obedience and respect, and a universal gladness spreads itself through the whole cell, which is expressed by particular acts of joy and exultation. They have a peculiar way of skipping, leaping, and standing up on their hind-legs and prancing with the others. These frolics they make use of both to congratulate each other when they meet, and to show their regard for the queen.' As among bees, there are a few genera of solitary ants. In these Mutillidae, the males are winged, the females wingless, and there are no workers. Four forms have been found in Britain, one of which, *Mutilla europæa*, inhabits the nests of humble-bees, on which it appears to be parasitic.

Division of Labour, and Polymorphism.—There is a general division of labour involved in the existence of a caste of workers separate from the males and normal females. But apart from this the workers come to discharge among themselves very different functions. The young and the old, the small and the large, are set apart for different duties. Such division of labour tends, however, to produce difference of form (or polymorphism), just as variety of occupation tends to do among men. Thus it is not surprising to find in some species several types or castes of workers. In the Sauba or umbrella ant of South America, besides males and queens, there are (a) small ordinary workers, (b) large workers with very large hairy heads, and (c) large workers with large polished heads. Bates suggests that the last two kinds are of use in war as passive butts, 'as *pièces de résistance*, serving as foils against onslaughts made on the main body of workers.' In other cases, certain members of the community serve as 'animated honey-pots,' with the somewhat tantalising function

gravely recorded. The observations of the ancients have been verified by Hüber with his characteristic carefulness, and Thoreau gives a graphic account of some of the encounters he witnessed during his life at Walden. In some ant communities, members of other species are captured when young, and used as slaves. As these not only work and forage for their masters, but even feed them, the latter degenerate, and *Polyergus rufescens* is wholly dependent even for its life on its slaves. Lubbock notes how every transition is exhibited between bold marauders and enervated masters—hopeless parasites upon their slaves. Besides the association with aphides already noted, ants tolerate various insect inmates within their nests.

Relation to Plants.—While flying insects, like bees, which carry the fertilising pollen from one plant to another, have played an important part in the evolution of flowers, ants have had an influence of another kind. Visits of ants would in most cases simply mean a loss of honey without any advantage to the plant; it is therefore natural that many plants should exhibit contrivances for warding off the attacks of ants. Moats formed by leaf-cups, curved slippery surfaces, narrow or closed passages, viscid secretions, bristling hairs, &c. are all effective protections against ants. In the tropics, some species of ants do much damage by stripping off the leaves of plants, but in other cases ants may be of actual service in driving off more destructive species or other insects. The large 'bull's-horn thorns' of certain Central American species of acacia are tenanted by a species of ants (*Pseudomyrma bicolor*), forming 'a most efficient standing army for the plant, which not only prevents the mammalia from browsing on the leaves, but delivers it from the attacks of a more dangerous enemy—the leaf-cutting ants.' Moseley notes that in the case of two plants growing as Epiphytes (q.v.) on trees, a gall-like tumour is always formed at their base by ants, without which the plants cannot thrive.

Intelligence.—The senses of ants are well developed. They are keenly sensitive to slight changes of temperature and light, and can both perceive rays and hear sounds for which our sense-organs are not adapted. Some forms are able to make a rasping noise by means of a structure on the abdomen, and the solitary ant, *Mutilla*, utters when seized a characteristic note between a buzz and a squeak. The highly developed sense of smell appears to aid them greatly in finding their way, in which, however, they are not, at the best, adepts. They are able to recognise the members of their own community even when these are intoxicated, or removed from the nest as larvæ and brought up separately. Several naturalists have shown that ants are able definitely to communicate with one another 'by something approaching to language.' The habits of ants have long formed a favourite study of naturalists, and the intimacy with which they have been studied is, doubtless to some extent, the reason of their being so often referred to. Their ceaseless industry when there is work to do has become proverbial, while many authorities have also noted an indulgence in 'sportive exercises' or 'play.' A recent observer, the Rev. W. Farren White, describes the exuberance of delight exhibited by the inmates of a formicarium when placed near the fire. 'They embraced each other, and skipped and danced like playful lambs or kittens.' Careful removal of the dead has also been observed. Their ingenuity in economising labour, e.g. in dropping desired objects from a height to others waiting below—in overcoming obstacles, e.g. by themselves forming living bridges or building more substantial inanimate ones—in the architectural devices exhibited by their manifold

Fig. 4.—Honey Ant (*Myrmecocystus mexicanus*):

a, natural size.

(From Rev. W. Farren White.)

of 'receiving, retaining, and redistributing the honey.' Sanguinary wars between different species of ants have been observed from very early times, and the dates of certain remarkable campaigns

ness, and in many other ways—has become a common subject of deserved admiration, though their marvellous powers are associated with no less striking limitations. In their recognition after separation for months, in their care for the young or disabled, as well as in their persistent enmity to competing species and communities, ants exhibit a considerable range of emotional development.

'When we see an ant-hill tenanted by thousands of industrious inhabitants, excavating chambers, forming tunnels, making roads, guarding their home, gathering food, feeding the young, tending their domestic animals, each one fulfilling its duties industriously and without confusion, it is difficult altogether to deny them the gift of reason,' or avoid admitting 'that their mental powers differ from those of men, not so much in kind as in degree.' There are many authorities, however, who emphasise the routine character of ant-behaviour, their relative lack of plasticity or educability, their independence of previous experience, and so on, and would conclude that their mental powers, being predominantly instinctive rather than intelligent, differ from those of the higher big-brained animals in kind rather than in degree.

See Lord Aveybury's *Ants, Bees, and Wasps*, and Prof. W. M. Wheeler's *Ants: their Structure, Development, and Behaviour* (1910).

Antacids are drugs used for the purpose of neutralising or diminishing excessive acidity of the digestive system, or of the different excretions. Substances which act upon the former are termed direct, and upon the latter remote, antacids. Many drugs act in both ways, such as potash, soda, lithia, lime, and magnesia, as well as their combinations with carbonic acid. Some substances—as, for instance, ammonia and its carbonate—are only direct antacids, being converted into acids in the body, and thus increasing the acidity of the urine. Others—like the acetates, tartrates, and citrates of the alkalies—are not direct antacids, inasmuch as they are neutral salts, but, being converted into carbonates in their passage through the body, they act as remote antacids, and reduce the acidity of the urine. The direct antacids are required when digestion is followed by the generation of too much acid. When this is confined to the stomach, potash is to be preferred, as being more readily absorbed, or in the case of aged or feeble individuals, ammonia, as being at once a stimulant and an antacid. If the acidity exists in the bowels, soda, lime, or magnesia is to be given, as being less readily absorbed than potash, and more likely, therefore, to reach the situation of the acidity. The remote antacids are required in cases where the condition known as acidosis exists in the blood, and the urine is excessively acid. In such cases bicarbonate and citrate of potash are the antacids usually chosen.

Antæus, in Greek Mythology, a son of Poseidōn and Gē, a huge giant in Libya, who challenged all strangers who came to his country to wrestle with him. No one could throw him, because every time he touched the earth, his mother, he received new strength. Hercules crushed him by lifting him up so that he could not touch the earth.

Antalcidas, a Spartan politician, son of Leon, chiefly known by the celebrated treaty concluded with Persia at the close of the Corinthian war in 387 B.C., and called by his name, as it was the fruit of his skilful diplomacy and naval operations. By this treaty all the towns on the mainland of Asia Minor passed under the Persian sway; the Athenians retained only the islands of Lemnos, Imbros, and Skyros, while all the other Greek cities were declared independent. In consequence of it Spartan influence became supreme in Greece, while every-

thing gained by Athens in the Persian wars was lost. Antalcidas was ephor at Sparta in 370–369. After the battle of Leuctra he seems to have lost the favour of Persia. He is said to have starved himself to death in vexation at the ill success of another mission, probably in 367. See GREECE.

Antanànarivo, or TANANARIVE, the capital of Madagascar, has a population of about 70,000. It is situated on a hill, in an undulating district, at an elevation of nearly 5000 feet above sea-level. It is connected by rail (229 miles, opened 1913) and road with Tamatave, the chief seaport. The royal palace occupies the summit of the hill; adjoining are the dwellings of the chief officers of government. There are Anglican and Roman Catholic cathedrals, many other churches, a mosque, government buildings, schools, hospitals, &c. The French occupied the city, 30th September 1895.

Antara, or ANTAR, a celebrated Arab chief in the middle of the 6th century, one of the seven poets whose prize-poems were hung up on the Kaaba, and thence called *Moallakat*; see ARABIAN LANGUAGE.

Antarctica. The Antarctic regions are essentially the antithesis of the Arctic regions. A glance at the north and south polar charts shows that there is a polar basin—the Arctic Ocean—in the north surrounded by continental lands, but that in the south there is a polar continent—Antarctica—surrounded by the great oceans. A further remarkable feature is that if the land forming the continent of Antarctica were uplifted at sea-level, turned upside-down, and immersed in the north polar basin, it would almost exactly fill it up to sea-level. The fact that the great continents of Europe, Asia, and America not only surround but actually help to form part of the Arctic regions, and also that for centuries these continents have been the home of the civilised nations of the world, accounts for the earlier and more extensive exploration of the north polar regions, which have not only been more accessible to these peoples, but have also been wrapped up with their industrial and intellectual activities. The search for a shorter route from the West to the riches of the East first stimulated Arctic exploration, and finally led to the scientific exploration of the Arctic regions. The reverse has been the case in the exploration of the Antarctic regions.

Although the Antarctic continent, to which Sir John Murray, who did so much in his lifetime to stimulate Antarctic research, gave the fitting name of 'Antarctica,' is cut off so completely from other continental land-masses by the widening out of the southern extensions of the Atlantic, Pacific, and Indian Oceans uniting to form the Antarctic or Southern Ocean, yet there is very strong evidence that there was a much greater extension of the Antarctic land-mass even in recent geological times, and that South America, South Africa, Australia, and New Zealand were formerly all united with Antarctica (see ANTARCTIC OCEAN).

Recent expeditions have added much to our knowledge of Antarctica. Antarctica has an area almost equal to Europe and Australia combined. Comparing its area with that of the other continents, we find:

1. Asia.....	17,250,000 square miles.
2. Africa.....	11,520,000 " "
3. North America.....	7,728,000 " "
4. South and Central America.....	7,128,000 " "
5. Antarctica.....	5,470,000 " "
6. Europe.....	3,750,000 " "
7. Australia.....	2,947,000 " "

The coast-line is approximately 14,000 miles. The continent lies almost entirely within the Antarctic circle, the Graham Land peninsula only pushing

well north of the circle, while there is a deep dip in the coast-line south of New Zealand, where the Ross Barrier almost skirts the 78th parallel of latitude, and another to the south of the South Atlantic Ocean where the Weddell Sea washes the shores of Coats Land and Luitpold Land to almost as high a latitude. Although great stretches of the coast-line of this extensive continent have yet to be explored, namely, between Enderby and Coats Land, Luitpold Land and Graham Land, and Charcot Land westward to Edward Land, yet, on the other hand, no less than 3000 miles are now relatively well known, including part of the coast of Edward Land, and the sea-face of the Ross Barrier, the cliff of which only varies to a relatively slight degree every year, Victoria Land, George Land, Adelie Land, Wilkes Land, Mary Land, with their ice-barriers, and Wilhelm Land; Coats Land and Luitpold Land; and Graham and Charcot Lands. Less-known portions of the coast-line are Enderby Land and the southern coasts of eastern Graham Land, including Föyn Coast. The most extensive and the best-known coast-line stretches continuously for over 2200 miles from well south of the Ross Barrier to Wilkes Land. Victoria Land has been more thoroughly explored by many expeditions because the Ross Sea offers the easiest approach to the Antarctic continent. The Ross Barrier being almost entirely afloat, its seaward ice-cliff, therefore, technically cannot be considered as coast. These expeditions have chosen this easier passage rather than meet rebuffs in regions like the Weddell Sea and the ice-congested seas between Graham Land and Edward Land.

The coast-line of Adelie Land, Wilkes Land, and lands adjacent are also difficult of access on account of heavy pack, great glacier ice-tongues, and bad weather. Similarly the supposed coast-line between Graham Land and Edward Land has been shut out from the researches of eager and capable explorers on account of great difficulties of navigation—witness the drift of the *Belgica* and the voyage of the *Pourquoi-pas?* The interior of Antarctica has been chiefly revealed to us by the researches of Scott, Armitage, Shackleton, David, Mawson, Wild, and Amundsen.

Murray always emphasised that there was one main continental mass, and this view has more recently been supported and emphasised by Bruce, Mossman, Rudmose Brown, and others. The extraordinary view of Sir Clements Markham in 1904 that there was a strait joining the Weddell and Ross Seas was even at that time against all evidence, especially in view of Bruce's discovery of Coats Land and the meteorological researches of Mossman. The remarkable circumstance is that this extravagant theory has since 1904 been supported by such authorities as the late Sir George Darwin, Penck, Mawson, and Griffith Taylor. The seiche theory of Darwin has clearly been nullified by the journeys of Shackleton, Scott, and Amundsen; Penck's meteorological reasons do not agree with the more complete meteorological conclusions evolved; the geological evidence on which Mawson and Griffith Taylor rely, though more weighty than any other, is insufficient to support the theory of a strait or belt of low-lying ice stretching across from the Weddell to the Ross Sea. The aim of these geologists has been to differentiate between the folded mountain system of Graham Land and the plateau formations of Victoria Land, but it is by no means necessary to have a trough between the systems in spite of a downthrow along the east coast of Victoria Land in the region of the Ross Sea and Barrier. For the elucidation of actual conditions further expeditions are required in order to explore east Graham Land, with journeys west and south into the interior,

and in order to explore Edward Land, with journeys east and south into the interior, as well as a serious attempt to demarcate the continental coast between Charcot and Edward Land and penetrate into the interior at different points along that coast-line. These explorations promise to be as difficult and dangerous as any yet undertaken in Antarctic regions, and it is not worth while attempting them without strong, powerful, and thoroughly equipped vessels directed by experienced ice-pilots and trained oceanographers and with effectively equipped land-parties led by geologists and surveyors.

The general features of Antarctica and its covering of ice and snow depend on the geological constitution of the continent. It seems most likely that Antarctica consists of one great continental land-mass, with the mighty Victoria-Graham mountain-range with an overlapping or break somewhere on the Pacific side of the South Pole. It is not unlikely that the Victoria Land mountain-range pushes across to the Weddell Sea, while the Graham Land range runs parallel and close to it in western longitudes over towards Edward Land. This theory does not, however, necessitate the idea of a 'gutter' at sea-level between the two opposed Atlantic and Pacific mountain systems.

To sum up, Antarctica is probably one great land-mass having an approximate area of 5,500,000 square miles, with a Pacific-Atlantic mountain backbone, continuous but changing in structure, rising to a maximum height of 15,500 feet. The average height of the Antarctic continent has been estimated at from 2500 to 4000 feet by Simpson and others. The land drops abruptly towards the sea in western longitudes, and forms a coast more or less continuously flanked by lofty mountains, with here and there glaciers or ice-barriers pushing far out to sea. On the Indian Ocean and Atlantic side the land slopes gently in long stretches from this mountain-range, and is more or less completely covered by an ice-sheet which near the South Pole has a height of 9800 feet, with only occasional rock-masses like those of Adelie Land, Wilkes Land, Gaussberg, Enderby Land, and Luitpold Land, &c. These break the monotony of almost continuous undulating ice-sheets overlying the land, and quietly descending towards the Atlantic and Indian Oceans, terminating in the sea by ice-walls or tapering tongues of ice.

The discovery of Archeocythanae in the Weddell Sea by Bruce is an indication that Cambrian rocks not only occur in the vicinity of the Beardmore Glacier, where they were discovered by David and Priestley, but stretch across the continent to Coats Land and east Graham Land or to both. Otherwise little is known of the geological structure of the continent south of the Atlantic Ocean except in Graham Land. On the coast of Graham Land the discoveries of Nordenskjöld have demonstrated an Atlantic type of coast-line comparable in origin and structure with that of southern Patagonia. Belgian and French explorations have shown the west coast of Graham Land to be of the Pacific type, and the same is probably true of Edward Land, whose granite structure may well represent the worn-down stump of a folded mountain-range. It is practically only of Victoria Land and of Graham Land that we have detailed geological knowledge, although Amundsen's expedition made some observations on the geology of Edward Land, and Mawson carefully examined much of Wilkes Land and George Land. The mountains of Victoria Land show a faulted plateau structure which apparently continues south-westward in the Commonwealth and the Maud Ranges. Probably it will also be found in Luitpold Land and Coats Land, but as yet we know nothing of the structure

of these two lands. Elevated but almost horizontal strata of Devonian and Cambrian age are exposed in the mountains of Victoria Land, associated with a certain number of volcanoes along the major fault line. Possibly the eastern side of the Ross Sea is of the same nature, and the sea itself lies in a basin depressed by faulting, whose southern part, covered by sea and land ice and by superincumbent snow, forms the Ross Ice-Barrier. Wilkes Land—to use a general term—is of the same structure as Victoria Land, and so probably is Wilhelm Land, although the only part of that known is the extinct volcano of Gaussberg. East of the folded ranges of Graham Land—the counterpart of the cordilleras of southern South America—occur several extinct volcanoes. But Mount Erebus on Ross Island, off Victoria Land, in $77\frac{1}{2}^{\circ}$ S., is the only known active volcano in Antarctica.

Except on the coastal rocks, where a few mosses, lichens, and algæ are to be found, and where in summer there are numerous bird rookeries, the continent of Antarctica is entirely devoid of life. There are no land animals. See POLAR EXPLORATION.

Antarctic Ocean. It is not satisfactory to confine the Antarctic Ocean to the seas south of the Antarctic Circle. A more satisfactory definition is that the Antarctic Ocean includes those seas that are bounded to the north by the average limit of floating ice.

This boundary may be said to coincide roughly with the 50th degree of southern latitude, but it bends southward to 57° S. in the vicinity of Cape Horn, north of 40° S. in the South Atlantic Ocean, north of 50° S. between the longitudes of Kerguelen and Tasmania, and south of 50° S. between the longitudes of Tasmania and New Zealand (see *Admiralty South Polar Ice Chart*). This great stretch of ocean is formed by the southern extensions of the Atlantic, Indian, and Pacific Oceans, and is known as the Antarctic Ocean, or Southern Ocean. It washes the shores of Antarctica, and stretches almost to 78° S. in the Ross and Weddell Seas, and includes in its area a number of islands lying far from neighbouring continental lands. The Antarctic Ocean is separated into seas which have been given names by recent explorers. Besides the older names of Ross and Weddell Seas, we have Biscoe Sea, Davis Sea, D'Urville Sea, and Bellingshausen Sea. Chun, Gerlache, Bruce, Drygalski, Filchner, Mawson, and Davis have done much during recent years to elucidate the conformation of the floor of this ocean; while Ross, and later Nares and Wyville Thomson with the *Challenger*, initiated this bathymetrical survey. The work of the *Scotia* is the most noteworthy both in the extent of its bathymetrical surveys and especially their relationship to the position of the coast-line of the Antarctic continent—viz. Coats Land in the Weddell Sea—and in the discovery, where water of over 3000 fathoms was previously supposed to exist, of important 'rises' which are believed to indicate former land bridges uniting Antarctica with South America and South Africa. The discovery of the 'Scotia Rise,' as a continuation of the Mid-Atlantic Rise, extending for 1000 miles to the south of Gough Island, was most significant, as well as that 'rise' connecting Graham Land, South Shetlands, South Orkneys, South Sandwich Group, South Georgia, and Falkland Islands with South America. The result of the work of all these deep-sea researches is a very complete mapping of the floor of the Antarctic Ocean, so that not only the depths but also the nature of the bottom is now moderately well known. The coast-line of Antarctica is surrounded by a belt of blue or glacial mud, to the north of which lies another belt of diatom ooze which in places stretches beyond the

limits of the Antarctic Ocean as above defined. This northern limit of the diatom ooze belt abuts against an extensive deposit of globigerina ooze which stretches far beyond the northern limits of the Antarctic Ocean.

The physics of these seas is as yet little worked out, although many important observations of temperature, salinity, specific gravity, tides, currents, &c. have recently been collected; but the discussion of these observations is yet to be undertaken. It is interesting to note, however, that as in Arctic seas, so also in Antarctic waters, the well-known phenomenon of an intermediate warm layer of water at about 100 fathoms is to be found, appearing to indicate a warm but more saline wedge of water pushing south and sinking beneath the colder, but by virtue of its less saline nature relatively lighter, water overriding this warmer layer. Water of very low temperature appears to flow out of the Antarctic Ocean, appearing as cold bottom water in lower latitudes. More or less north, in the latitude of 65° S., there is a continuous easterly surface drift, mainly due to westerly winds, throughout this belt of the Antarctic Ocean, but south of this latitude this surface drift ceases to exist, and a complicated series of drifts, mainly due to the direction of wind, comes into force. These drifts are generally known in the Bellingshausen and Weddell Seas. The drift of the *Belgica* contributed towards the elucidation of the surface drift in the Bellingshausen Sea. There the permanent easterly drift almost reaches the seventieth degree of latitude, while south of 70° S. the *Belgica* drove mainly towards the west with a westerly drift. But the drift varied from month to month, and the direction of the drift in the same locality at different times greatly varied. In the Weddell Sea the researches of the *Scotia* determined that the easterly drift extended to about as far south as the sixty-fifth degree of latitude, and that in approximately that latitude it began to drive to the westward. The region of change of drift is marked by the presence of a large number of icebergs. The westerly drift appears to drive from east to west along the coast of Coats Land, thereafter to be turned into a northerly drift along the east coast of Graham Land, turning east again north of the sixty-fifth degree of latitude. The drift of the *Deutschland* and *Endurance* has confirmed these observations of the *Scotia*. The nature and distribution of ice in Antarctic seas is important in relation to navigation, as bergs of great size may be found as far north as the northern limits of the Antarctic Ocean as above defined. Besides bergs there is the ordinary sea ice, concerning both of which reference should be made to Bruce's *Polar Exploration*. The icebergs are of enormous size and of tabular formation, in contrast to the more irregular-shaped and small icebergs of Arctic seas. Relatively few irregular bergs are found in Antarctic seas. The tabular bergs are of enormous size, frequently three or four miles in length, and occasionally even thirty to forty miles or even more. These are calved off great barriers, such as the Ross Barrier, and the ice-tongues discovered by Mawson and Davis off the coast of Adelie and Wilkes Lands. The distribution of pack-ice and bergs, especially pack-ice, is dependent mainly on winds and surface drift, and results generally in heavy pack hugging almost every part of the Antarctic coast-line, the only exception being the comparatively ice-free coasts of the Ross Sea, no ship having ever yet been stopped from reaching M'Murdo Sound and the Ross Barrier. West of Cape Adare, especially west of Adelie Land, no vessel has yet been able to penetrate to the coast except in the vicinity of Termination Barrier and Cape Ann, and in the

Weddell Sea, where, although Weddell and Monrell were exceptionally fortunate in 1823, Ross in 1843 was beset like Bruce in 1903 and 1904, Filchner in 1912, and Shackleton in 1915. Only Filchner reached the land, to be beset and frozen in the drifting pack for the whole winter like Shackleton, whose ship was crushed. Similarly, in the Bellingshausen Sea De Geilache was beset, and drifted a whole year out of sight of the coast; and Charcot also was unable to penetrate into the coast west of Graham Land.

Much has been added to the biology of Antarctic seas by the researches especially of the *Belgica*, *Scotia*, *Discovery*, *Gauss*, *Terra Nova*, *Française*, *Pourquoi-pas?* and *Aurora*, and reference should be made to the scientific reports of these expeditions. The researches of the *Scotia* added more than any other expedition to our knowledge of the deep-sea fauna of Antarctic seas. Antarctic seas are very rich in diatoms and other algæ, which often colour the water olive-green or brown, and quickly fill up tow-nets with a gelatinous mass. These diatoms form the basis of much pelagic and deep-sea animal life, and, sinking to the bottom, account for the great circumpolar belt of diatom ooze—the position of which does not, however, coincide with the surface distribution of the diatoms, and indicates undercurrents to the north. Birds—especially penguins and petrels—seals, and whales are in turn supported by this vast amount of animal life in the sea, so that as soon as the ice breaks up with the advance of spring and summer they find their way south—the birds to rocky terraces and cliffs bordering this rich sea, where they can find a plentiful supply of food for themselves and their young, and the seals to the ice-pack, where they bring forth and nourish their young, and mate again for the next season. Whales abound in these waters so plentifully that during summer months in Antarctic waters south of the Atlantic Ocean alone produce to considerably over a million sterling is taken. Except in the case of whales, owing to their apparently extensive migratory habits, and in the case of two or three birds for the same reason, the theory of bipolarity seems to break down before modern biological research in Antarctic seas; and indeed, although many forms appear to be circumpolar in distribution, others appear to be distinctly confined to definite areas. Generally speaking, the fauna of the Weddell Sea, for instance, appears to be different from that of the Bellingshausen Sea and of the Ross Sea. See POLAR EXPLORATION.

Ant-bear, the great ant-eater (see ANT-EATER); also the Aard-vark (q.v.).

Ant-eaters (*Myrmecophagidae*), a family of South American mammals belonging to the insect-eating division of the order Edentata. The absence of teeth, the long head, tubular mouth, worm-like tongue, the marked development of the third digit of the fore-foot, and the insect diet, are prominent characteristics of this small family. (1) The largest form is the Great Ant-eater (*Myrmecophaga jubata*), or Ant-bear, as it is called in Demerara, which inhabits swampy regions in South and Central America. It measures 4 feet in length, not including the bushy tail, which is sometimes as long as the body. The long coarse hair is of a dark-gray colour, and a black band extends from the chest across the shoulder backwards. The skull is prolonged into a narrow snout. The ears and eyes are very small. The long worm-like tongue may be protruded to a length of 18 inches from the tubular mouth at the end of the muzzle, and is covered with a viscid secretion from large glands which extend back over the chest. By this means, the very abundant termites or white ants are caught in great

numbers as they issue from the invaded nest, and whipped with extraordinary rapidity into the mouth.

Great Ant-eater (*Myrmecophaga jubata*).

The internal opening of the nose is unusually far back in the mouth, as in crocodiles and whales. The posterior portion of the stomach forms a muscular gizzard in adaptation to the nature of the food. The third digit of the fore-foot is much larger than the three others, and bears a very powerful claw, which is used in breaking into the termite nests. In walking, the fore-toes are much bent, the pointed tips are protected by being turned inwards and upwards, and the animals thus rest their weight in a sort of club-footed fashion on the outer portions of the outer toes. The five toes of the hind-foot are almost equal, and bear strong claws; the broad sole rests on the ground. This form is wholly terrestrial, and has the reputation of being slothful, unsocial, and stupid. Like other insectivorous animals, it can live for prolonged periods without food. It spends much of its time in sleep, the long snout concealed in the fur of the breast, the hind and fore claws locked together, and the bushy tail thrown over all, as if for a shade from the sun. Though the collar-bones are rudimentary, the Great Ant-eater has great strength in its fore-legs, and is said to hug like the bear, so as to crush its enemy to death. The female bears but one at a birth, and carries it about on her back during its slow growth. The flesh is eaten by the Indians and negroes. Another much smaller form, the Tamandua (*T. tetradactyla*), is arboreal. The head is shorter, and the somewhat prehensile tail is scaly below and at the end. The Little Two-toed Ant-eater (*Cyclosurus didactyla*) is also arboreal. The skull is still shorter, the fur is softer, the feet adapted for climbing, the collar-bones well developed, and the tapering tail thoroughly prehensile.—(2) The Pangolins (q.v.), or Scaly Ant-eaters of the Old World, though closely related, belong to a different family, and are discussed elsewhere.—The name Ant-eater is given at the Cape of Good Hope to the *Orycteropus capensis*, the Aard-vark (q.v.) or Earth-hog of the Dutch colonists, a quadruped of about the same size as the great ant-eater of America, and belonging to the same natural order.—(3) The *Echidna* of Australia are sometimes called Porcupine Ant-eaters; but though they agree with the above in the nature of their food, and in the sharp snout and protrusible tongue, their general structure is quite different. See ECHIDNA. (4) The *Myrmecobius fasciatus*, a small marsupial of Australia, is also called ant-eater.

Antecedent, a term in Logic, Grammar, and Mathematics. In Logic, it is a statement or proposition from which another is logically deduced. In Grammar, it is the substantive (word or clause) to which a relative points back. In Mathematics, we speak of the antecedent of a ratio—i.e. the first of two terms which compose the ratio; the first and third in a series of four proportionals.

Antediluvian (Lat. *ante*, 'before,' *diluvium*, 'the deluge') is the word used of anything that existed before the flood, in the patriarchal ages between Adam and Noah. The word is often employed in modern usage for anything antiquated or primitive, in a somewhat disparaging sense.

Antelopes (*Antilopidae*), a family of Mammalia belonging to the order of Ruminants (q.v.), and to the hollow-horned section of that order—in which the horns consist of a hoary sheath, surrounding a bony process of the skull, and are permanent, not annually renewed. In antelopes, however, the bony centre of the horns is solid and not occupied, as in those of goats, sheep, and oxen, to a considerable extent, with cells communicating with the frontal sinuses. They differ externally from goats in their beardless chin, and from them and sheep in the absence of longitudinal angles or ridges on the horns, which are, however, very generally marked with cross rings. The body is slender and deer-like, the feet small and elegant, the tail short and tufted, the hair generally short, and the colour often lively. Some species, however, have comparatively long hair; and a few which inhabit cold mountainous regions are clothed with wool mixed with longer and coarser hair, as in the Chamois (q.v.) of the Alps, Caucasus, &c.; the Rocky Mountain Goat (q.v.) of North America; and the Chiru of the Himalayas. Many species have *tear-pits* below the eyes, as in Deer (q.v.). The females of many species, as of deer, are destitute of horns; and if they alone came under observation, it would be difficult to say to which genus they belonged. The size is very various; the Guevi, or Pigmy Antelope of Africa (*Antelope pygmæa*), is only 8 to 9 inches high at the shoulders, whilst the largest forms measure 5 or 6 feet. Almost all the species of antelopes are peaceable, timid animals, and are distinguished by agility and fleetness. Most of them are gregarious. Some inhabit plains; others are found only in the most inaccessible mountainous regions; whilst others dwell in jungles and deep forests. Many, on the other hand, are water-loving forms, and frequent the banks of rivers. North America possesses two species, found only in the western parts of the continent, the Prong-horn (*Antilocapra*) and the Rocky Mountain Goat (*Apllocerus*), which depart considerably from the typical character of the family. It has been proposed to introduce the latter as a wool-bearing animal into the Highlands of Scotland. The Prong-horn sheds the horns annually like most species of deer. Europe produces only the Alpine Chamois and the Saiga (*A. saiga*), which inhabits the southern plains of Poland and Russia. Asia has about fifteen species; but the vast majority are found in Africa, and particularly in South Africa. The very numerous forms are arranged in sections or groups according to the peculiarities of the horns and other characters, but a satisfactory classification is difficult. The flesh of most antelopes is used for food, and they are therefore much hunted. In Africa some of the species exist in great numbers, and when severe drought occurs in the regions which they ordinarily inhabit, dense and multitudinous herds occasionally appear in the interior of the Cape of Good Hope, to the terrible devastation of the crops. Even the saigas of the Tatarian plains congregate in herds of many thousands in the end of autumn.

The name antelope is sometimes more particularly applied to a species also known as the Common or Indian Antelope, and as the Sasin. It is a native of India and the eastern parts of Asia, and is a beautiful animal about 2½ feet high at the shoulder, with erect, diverging horns, bent in a spiral of two or three turns. The hair is uniformly short, except that, as in many other species of antelopes, there are small tufts of bristles on the

knees. It inhabits open plains, and the herds exercise great watchfulness. Its fleetness is such that greyhounds chase it in vain; and it can easily bound over an inclosure of 11 feet in height, or over a distance of 10 or 12 yards. The flesh is held in small esteem, and the animal is less than many of its congeners an object of the chase.—The Saiga is a much less graceful animal, with short, somewhat lyre-shaped horns in the males only. These are used by the Russians and Chinese for the manufacture of many articles of domestic economy; and it is chiefly for their sake and that of the skin that the saiga is hunted, the flesh having a disagreeable taste, which is ascribed to the saline and aromatic plants of the steppes.—The Dzeren (*A. gutturosa*), sometimes called the Chinese Antelope, and known among the Chinese by a name which signifies the Yellow Goat, is an inhabitant of the arid deserts of Central Asia. The flesh is highly esteemed. It derives its specific name from a large movable goitre-like protuberance on the throat of the old males, produced by a dilatation of the larynx.—The Addax or Nubian Antelope (*A. addax*), which was known to the ancients, and is

Addax (*Antelope addax*).

mentioned by Pliny, has horns very similar to those of the Indian Antelope, but is a larger animal, less graceful, with a slight mane on the neck, a tuft of long hair on the forehead, and large broad hoofs, adapted for treading on fine and loose sands. It inhabits the deserts of Central Africa, and, contrary to the usual habits of the genus, is said not to be gregarious, but to live in pairs. The Chikara

and some other Indian species are distinguished by two additional rudimentary horns in front of the ordinary horns, and immediately over the orbits. The chikara inhabits thick forests and jungles. Like the addax, it lives in pairs; as do also the Stein-bok of South Africa, an extremely graceful species, and the Kleene-bok of the same country (*A. perpusilla*), a beautiful and active little creature with very small horns. The kleene-bok is of a mild and gentle disposition, and extremely capable of domestication. The Gazelle (q.v.) of North Africa (*A. dorcas*), one of the species known to the ancients, is very frequently domesticated; and from its gracefulness of form, its gentleness of manners, and its bright black eyes, has afforded to the Arabian poets one of their most favourite objects of comparison. The South African Spring-bok (q.v.) is another very beautiful species, and is frequently domesticated by the colonists at the Cape of Good Hope. Among the numerous species which that country produced

may be mentioned also the Blauw-bok (*A. leucophaeus*), now extinct; a survivor is the Kaffrarian Oryx (q.v.). Still more worthy of notice among the South African species, but in some measure departing from the strict antelope type, is the Eland (q.v.), the largest of all the antelopes—an animal which may probably be found valuable in domestication. The Koodoo is another noble species allied to the eland. The Nyl-ghau (q.v.) of India and the Gnu (q.v.) of South Africa are also among the largest antelopes, but depart still further from the generic type. Less different from the ordinary type, but still with a marked approach to a bovine appearance, are the Bubalis of the ancients, frequenting the north of Africa, and the nearly allied Kaama or Harte-beest of the Cape of Good Hope. The flesh, skin, and horns of the antelopes have been widely utilised from early times. Antelopes may be grouped according to habitat, as desert, bush, rock, and plain forms. The Indian antelope is sacred, and the exaggerated development of a single horn in a Chinese antelope may have favoured the unicorn myth. See *The Book of Antelopes*, by Sclater and Thomas (4 vols. 1894-1901).

Antennæ, or feelers, the anterior appendages on the head of crustaceans, insects, and myriapods. The typical crustacean, such as a lobster, has two pairs of feelers, while insects and myriapods have only one pair. The name may also be applied to sensory processes on the head of some marine worms. They are really 'head-legs' modified for sensory purposes, and consist of a long series of joints, sometimes over 100 in number. They are supplied with nerve branches, and are used by the animals for feeling their way, for testing surrounding objects, and apparently for communicating with one

Various forms of Antennæ. (From Roget.)

another. Professor Graber has demonstrated the olfactory function of the antennæ of the cockroach, but some insects can smell their food even when robbed of their feelers. The smelling bristles of insects have been carefully studied by Braxton Hicks and Lowne in the case of the blowfly, where they occur very abundantly on the third joint of the antennæ. Peculiar sensory cones and knobs occur on the antennæ of some myriapods. The small antennæ of the lobster bear olfactory bristles, and have an ear lodged at the base. And in short there are numerous observations to justify the general statement that in many cases the antennæ are sensitive to smell, sound, and probably taste. Deprived of its antennæ, an ant, for instance, is peculiarly helpless.

Antequera (the *Antiquaria* of the Romans), an important town in the Spanish province of

Malaga, in a fertile plain on the left bank of the Guadalhorce, 65 miles W. of Granada by rail. Held by the Moors from 712 to 1410, it retains some portions of a commanding Moorish castle and of the ancient walls. It has a trade in oil and fruit, and some manufactures of woollens, silks, leather, and soap. Pop. 28,000.

Anthe'lia (Gr. *anti*, 'opposite,' and *hēlios*, 'the sun'), or GLORIES, are luminous rings seen by an observer on a cloud or fog which lies opposite to the sun. They occur chiefly in alpine regions and in the polar seas, and are only seen when sunshine and cloud, or fog, occur at the same time. They appear in the following way: When, from an elevated position—as the mast of a ship, or the ridge of a hill—the shadow of an observer is projected by the sun on a cloud or fog, he sees the head encircled by a glory or luminous ring, diminishing in brightness as it leaves the head as a centre. When the sun shines brightly, and the fog is dense, as many as four concentric rings of this nature are seen by the observer round the shadow of his head, having their common centre in the point where a line from the sun through the eye of the observer meets the fog. When the phenomenon assumes this form, the rings are more or less coloured—the colours of the two inner rings being generally brilliant, those of the third more faint, while those of the fourth are scarcely perceptible. This last has an angular radius of about 40°, and is very seldom seen. It bears frequently the name of the Circle of Ulloa or the White Rainbow. A phenomenon substantially similar to the anthelia occurs when, the sun being near the horizon, the observer sees an aureola surrounding the shadow of his head cast upon grass or corn moistened with dew. See HALOS, DIFFRACTION, LIGHT, RAINBOW, REFRACTION.

Anthelmintics. See VERMIFUGES.

Anthem, a shortened form of ANTIPHON (Gr. *anti*, 'in return,' *phōnē*, 'voice;') a piece sung in alternate parts), a species of musical composition introduced into the service of the English Church in the reign of Elizabeth, and appointed to be sung daily, at morning and evening service, after the third collect. The words of the anthem are taken from the Psalms, or other suitable parts of the Scriptures, and the music is either for solo, soli, or chorus, or a mixture of all three. In its origin, musical construction, and use it is similar to the motett of the Catholic Church, which name has been retained by the Lutheran Church. The word is also loosely used, in such phrases as 'the National Anthem,' for what is rather a hymn. See ANTI-PHONY, HYMN, MOTETT, NATIONAL HYMNS, SERVICE (MUSICAL).

Anthemis. See CAMOMILE.

Anther. See STAMEN.

Antheridium, the male reproductive organs of many cryptogams (Ferns, Horsetails, Mosses, &c., q.v.). They may consist of a single cell, but are usually multicellular sacs, within which the thread-like male reproductive elements or antherozoids are produced. These are liberated by the rupture of the antheridium wall, and the antherozoid is enabled, by means of the lashing movement of its cilia, to reach and descend the tubular passage of the archegonium to the female cell, which it is its function to fertilise. See ALGÆ, FERN.

Anthology, from a Greek word meaning literally 'a collection of flowers,' is a title given to a work consisting of a series of choice thoughts, generally used solely of collections of poems. By far the most important is the Greek anthology, though the Latin anthology is also famous.

Greek Anthology.—The first Greek anthology deserving the name was compiled by Meleager of Gadara, in Syria, about 60 B.C. He called it a 'Garland' (*Stephanos*), and included in it poems by himself and forty-six earlier poets—Archilochus, Alcaeus, Anacreon, Simonides, Sappho, and others. This collection was added to by four successive editors, and in the 10th century Constantine Cephalas made a new collection, containing the best in the earlier ones, with some additions. Maximus Planudes, in the 14th century, by his tasteless selection from the work of Cephalas, rather spoiled than increased the already existing store; but his excerpt was the only anthology known in the West until the 17th century. It was printed at Florence by Lascaris in 1494 and frequently re-edited, and translated by Grotius. Meanwhile, Salmasius had discovered in the Heidelberg Library (1606) the only extant manuscript of the older and richer anthology of Cephalas, and copied it. The Heidelberg MS. was subsequently carried to Rome and Paris, returning to its old home in 1816. The anthology, as Salmasius copied it, was not published till it was included by Brunck in *Analecta* (1772-76); and this was superseded by the standard *Anthologia Græca* of F. Jacobs (13 vols. 1794-1803; improved in 1813-17). The edition in Didot's *Bibliotheca* (1864-72) is admirable. Good selections from the anthology are those of Weichert, Jacobs, and Meineke.

The Greek anthology contains specimens of 300 Greek poets at all periods of Greek civilisation—the old Hellenic, Alexandrian, and Byzantine, heathen and Christian—and is invaluable as a reflection of Greek thought, mainly in its most human side, illustrating, with a fullness not elsewhere found, domestic life and private feeling. Love songs, witty verses, and devout sentiment are found there side by side; the terse, pithy, dignified poem suitable for inscription (epigram in the old sense; see EPIGRAM) of the ancient time is followed by the florid, ornate writings of the later period. Nowhere is there to be found a richer variety of poetic life, greater delicacy of sentiment, a more joyous serenity, a greater abundance of wise, true, and humane thoughts, than sparkle in the pages of the Greek anthology. There are English translations of selections by Wrangham, John Sterling, Merivale, Macgregor, and Garnett. See the little work on the anthology by Lord Neaves; Symond's *Studies of the Greek Poets*; Butler's *Amaranth and Asphodel*; Mackail's *Select Epigrams from the Greek Anthology* (new ed. 1906).

Latin Anthology.—The ancient Romans had no proper anthologies. In 1573, Scaliger published at Leyden, in imitation of the Greek anthology, a Latin anthology, under the title *Catalecta Veterum Poetarum*, and Pitthöus one at Paris in 1590. A larger *Anthologia* was issued at Amsterdam (1759 and 1773) by Peter Burmann the Younger, a better arranged edition of which was published by Meyer in 1835. The first critical Latin anthology was that of Riese (1869-70), containing 942 poems of very various merit. There is one by Tyrrell (1901) and one in the 'Golden Treasury Series' (1909).

Asiatic literature is extremely rich in anthologies, which consist sometimes of extracts from the best poets, arranged according to the subject, and sometimes of 'beauties' of their best poets, with biographical notices, which are either placed in chronological order, or according to the countries in which the authors lived. The Arabic, Persian, and Turkish literatures are rich in anthologies; there are also Tatar, Indian, and Chinese collections of a similar kind.

The Golden Treasury of the Best Songs and Lyrical Poems in the English Language (1861), by

F. T. Palgrave, is a brief English anthology (2d series, 1897). It has had many successors, among which those of Sir A. Quiller-Couch are notable. A larger selection is the *English Poets*, edited by T. H. Ward (4 vols. 1880; vol. v. 1918).

Anthos, CHARLES, LL.D., a well-known editor of classics, was born in New York in 1797. Educated at Columbia College, he was admitted to the bar in 1819; but next year was appointed adjunct-professor of Languages in Columbia College. In 1830 appeared his large edition of Horace. Five years later he became head of the classical department at Columbia College. A student of the most methodical habits, he was able to produce about fifty books, chiefly editions of the Latin classics and aids to classical study. His editions for a time were widely popular, even in England; more, however, from their superabundant explanations, with lazy schoolboys than with careful teachers. He died July 29, 1867.

Anthony, ST. See ANTONY, ST.

Anthozoa, one of the three classes of Coelenterates, including sea-anemones, dead-men's fingers, corals, &c.; now usually called Actinozoa (q.v.).

Anthracene, obtained in the distillation of coal-tar, is the source of artificial Alizarin (q.v.).

Anthracite or Stone Coal is black, has a kind of iridescent or metallic lustre, is not readily ignited, and burns nearly without smell, smoke, or flame (hence sometimes called *blind coal*), giving out an intense heat. Consisting almost entirely of carbon, and containing only a small proportion of volatile matter, it is a kind of natural coke, and is employed in the burning of lime and bricks, the reduction of iron, &c.

Anthrax, a destructive disease of sheep and cattle, horses and camels, is also known as Splenic Apoplexy or Splenic Fever, and in man as Malignant Pustule or Wool-sorter's Disease. In the most acute cases the animal falls as if it had received a severe blow, and goes into convulsions; the pulse is quickened, and the breathing becomes rapid and laboured, and death follows in a few minutes or hours. In less acute cases a fatal termination usually occurs within two days. Anthrax does not readily attack man, and is very rarely communicated by one human being to another. It occurs in those whose occupations bring them into contact with diseased animals and their hides or wool, such as butchers, farriers, and porters. In Britain the source of infection is generally imported wool or hides. Two distinct forms are met with: Internal Anthrax, or Wool-sorter's Disease, in which the spores are probably inhaled, and enter the blood from the respiratory organs—cases are rare, and death usually occurs between the third and seventh day; External Anthrax or Malignant Pustule, in which the bacilli are introduced through an abrasion or wound of the skin. Energetic treatment by excision or cauterisation may save the patient from a probably fatal issue. In 1881 Pasteur announced that by cultivating the bacillus causing the malady he was able to obtain a form which produced in sheep and cattle inoculated with it a modified anthrax much less virulent and fatal than the ordinary disease, and that the animals thus treated were proof against the ordinary anthrax poison. Pasteur's method is largely employed on the Continent, frequently, though not always, with success. By Sclavo's serum treatment in Italy the mortality in cases of anthrax in men was in 1900-4 reduced from 25 to 4 per cent.; in Britain it remained at 25. Klein found that the blood of white mice killed by anthrax produces a mild protective attack in sheep. Among other difficulties in the way of accurate results is the very different sus-

ceptibility to the disease even of different breeds of the same species of animal; one breed of sheep may be killed by a virus which produces a mild protective attack in another. At best, moreover, the immunity conferred by inoculation seems not to last more than a year.

Anthropoid Apes, the highest and most man-like monkeys, including Gorilla, Chimpanzee, Orang-utan, Gibbon, and several other species. They are technically described by the Linnæan title *Anthropomorpha*, and readily distinguished, as tail-less, semi-erect, and long-armed, from the dog-like apes (*Cynomorpha*), which have also a narrow partition between the nostrils (Catar-

rhini), and also inhabit the Old World. With the decidedly lower flat-nosed New-World monkeys, or *Platyrrhini*, there is no possibility of confusion. The anthropoid apes are all arboreal, and inhabit Africa, South-eastern Asia, and the Malay Archipelago. In all, about a dozen species have been described with more or less definiteness. The family is of special interest and importance in connection with the views held by evolutionists as to the descent of man. It is recognised by anatomists that all the attempts to establish a fundamental distinction, on anatomical grounds, between the physical structure of the higher apes and that of man are futile. Generic differ-

Skeletons of Anthropoid Apes compared with that of Man :

G, gibbon (for distinctness, given about twice the proportional size); O, orang-utan; C, chimpanzee; Go., gorilla; M, man. (After Huxley.)

ences, indeed, there are in abundance, but these establish only a difference of degree, and not of kind. Thus, in man, the great toe is not opposable to the others for grasping purposes, the angle between the face and the top of the skull does not exceed 120° , the teeth form an uninterrupted series, and so on; while the strong spines on the back of the gorilla's neck, the very marked eyebrow ridges in gorilla and chimpanzee, the especially long arms of the gibbon, and the protruding jaws of all the anthropoids, are equally characteristic adaptations to different ways of life. Even in the minutiae of blood-vessels, muscles, nerves, and brain-convolutions, impartial observers have demonstrated the closest resemblance. The differences of structure between the lowest monkeys and the higher are far greater than those between man and any anthropoid ape, the resemblances being especially obvious when young forms are compared. In their expressions of cerebral activity, whether intellectual or emotional, the anthropoids come in some respects very near the lowest human tribes.

On the other hand, while it is impossible to establish any fundamental distinction in physical structure between *Homo* and the *Anthropomorpha*, there is among evolutionists an equal consensus of opinion as to the impossibility of regarding an ape of any existing anthropoid species as in the direct line of human ancestry. As regards brain-structure, the most man-like ape is the orang, while the chimpanzee has the most closely related skull, the gorilla the most human feet and hands, the gibbon the most similar chest. The study of anthropoid fossils has not yet discovered the remains of any form which can be accepted as the 'missing link,' although extinct anthropoids, such as *Pithecanthropus* (q. v.), serve greatly to lessen the distance to

be bridged over. The reader should consult Darwin's *Descent of Man*, Hæckel's *Anthropogeny*, Huxley's *Man's Place in Nature*, and Hartmann's *Anthropoid Apes* (Internat. Sc. Series), where abundant references will be found. See also *EVOLUTION, MAN (Descent of)*; and *APE, CHIMPANZEE, GIBBON, GORILLA, MONKEYS, ORANG*.

Anthropolatry, the worship of man, the giving of divine honours to a human being. The early Christians accused the heathen generally of anthropolatry, and opposing Christian sects were not slow to use the term of one another, especially in connection with the doctrine of the person of Christ. The followers of Apollinaris were specially charged with this heresy. See also *APOTHEOSIS*.

Anthropology ('science of man') is the most comprehensive term applicable to that branch of knowledge of which mankind forms the exclusive subject. Taken in its widest sense, it includes all subordinate divisions (*general anthropology*), while *special anthropology* deals with the *Hominidae* as the chief branch of the group of *Primates*, and more particularly with their relations to the anthropoid members of that group. These anthropoids are the African gorilla and chimpanzee and the Asiatic gibbon and orang-utan, who are, in fact, the nearest akin to the human group. According to the now almost universally accepted principles of organic evolution, this kinship is not merely physical but *genetic*; that is to say, it is not merely an outward somatic resemblance, but an intimate connection based on common descent, or rather ascent, from earlier or more primitive forms.

The human group, however, does not spring from any of the four living anthropoids, but from a more generalised simian type from which all alike are derived independently, as shown in the appended

diagram arranged according to their cranial capacity, as indicated in cubic centimetres (c.c.):

THE ANTHROPOID STEM.—Although all the c.c.'s cannot be depended upon, the general impression is left from this diagram that the earlier remains are not necessarily the lowest in mental capacity as had hitherto been supposed, or rather taken as a matter of course. Indeed, Professor Sollas does not hesitate to say that 'the primitive inhabitants of France were distinguished from the highest civilised races, not by a smaller, but by a larger cranial capacity; in other words, as we proceed backwards in time the human crane increases in volume.' This, of course, is only partly true, for nobody pretends to say that the Aurignac skull is of larger volume than, for instance, the Andaman. But, as far as it goes, it helps to explain the extraordinary mental powers of Palæolithic man, especially during the Aurignacian and Magdalenian divisions of the Old Stone Age. 'We know,' writes Professor A. C. Haddon, a cautious and discriminating student of this period, 'that they buried their dead, and in some cases provided weapons and food for use in a future state. Their inventiveness is proved by the variety and gradual improvement in the technique of their tools and weapons. Their carvings in the round or low relief, their spirited engravings on bone and ivory, and their wonderful mural paintings, whether in outline, shaded monochrome, or polychrome, evince an astonishing æsthetic sense and technical skill.'

Here it should be stated that it was the appearance of Darwin's *Origin of Species by Natural Selection* which, by giving unity of the organic world, established the necessary connection between the mammalian, as between all other orders of the animal kingdom. With the abolition of fixed species all was changed. 'The whole scientific and literary world, even the whole educated public, accepts, as a matter of common knowledge, the origin of species from other allied species by the ordinary process of natural birth. The idea of special creation, or of any altogether exceptional mode of production, is absolutely extinct. And this vast, this totally unprecedented, change in public opinion has been the result of the work of one man.' These words are by Alfred Russel Wallace, who, himself a co-worker with Darwin, did jointly with him for the organic world what Newton by his laws of gravitation had done for the inorganic.

GENESIS OF THE HOMINIDÆ.—Passing now from the anthropoid group as a whole to its culmination

in man, it must now be asked what vital connection, if any, lies between the two groups. It may here be stated that a sought-for 'missing link' was found in 1892 by Dr Eugene Dubois in the fossil human remains discovered by him at Trinil in East Java, and commonly known as *Pithecanthropus erectus*, as named by him. These were a skull, some teeth, and a femur, which, although strewn about, are allowed to have formed parts of one body, and that almost certainly human or proto-human. They occurred in some late Pliocene or early Pleistocene beds, and if human would thus set the origin of man back some four or five hundred thousand years. But, of course, opinions differ, some holding them to be purely simian, others purely human, and others again intermediate, so that for the present we must be satisfied with Dr W. Duckworth's pronouncement that in *P. erectus* 'we possess the nearest likeness yet found of the human ancestor at a stage immediately antecedent to the definitely human phase, and yet at the same time in advance of the simian stage.' This view, it may be added, is supported by Dr W. J. Sollas, who has made a special study of the remains, and writes: 'The lowest term of the human series yet discovered is represented by *Pithecanthropus*, and dates from some part of the Pleistocene epoch.'

But while *P. erectus* thus remains for the present the starting-point in the history of mankind, several other relics have been brought to light both before and since its discovery, by which the organic evolution of the species may be traced back to extremely primitive forms. Appended are a few of the more conspicuous finds, more attention being paid to the later finds (Corrèze, Combe Capelle, &c.) than to the earlier (*Neanderthal*, *Spy*, &c.):

Neanderthal, near Disseldorf, skull found 1856; enormous superciliary ridges; one of the most ape-like.

La Naulette, near Dinant, Belgium, lower jaw, highly prognathous.

La Denise, Upper Loire, two retreating frontal bones, glabella very prominent.

Krapina, in Croatia, the remains of some ten fossil men in a cave or rock-shelter, with rhinoceros; at least one frontal bone distinctly retreating; brow-ridges prominent; no chin proper; generally of Neander type; Mousterian dressed stones.

Le Moustier, Vézère Valley, a complete skeleton; flat retreating frontal; thick brow-ridges; chinless; high prognathism; Neanderthal type. The name *Homo moustierensis* has been given to this man.

Brux, near Prague, skull in parts like Neanderthal.

Spy, Namur district, two nearly perfect skeletons (man and woman) found 1886; huge superciliary ridges and glabella, rudimentary chin; Mousterian flints.

Galley Hill, Kent, nearly perfect skeleton with extremely long, narrow, and depressed skull, and prominent glabella and brow-ridges; significance doubtful.

Podbaba, near Prague, part of skull found 1883, with bones of extinct mammals (mammoth, rhinoceros); large brow-ridges and depressed frontal region like Neanderthal.

Predmost, near Preraz, Moravia; many skeletons found 1894, with mammoth; a variety of *Homo sapiens*; child with ivory necklace.

Marcilly, Evreux district, part of skull perhaps of Neanderthal type; deep depression between brow-ridges and frontal.

Mentone, Grimaldi or Balzi Rossi Caves, several skeletons, some of Cro-Magnon race, two of Negroid type (Grimaldi race).

Eguisheim, near Colmar, part of skull found 1865, with *Elephas primigenius*; prominent brow-ridges, frontal broad but retreating.

Laugerie Basse, Dordogne, male skeleton, two female skulls; thick parietals; a.c. above the modern average, save in one female skull very low (1100 c.c.).

Lagya Santa, Minas Geraes, Brazil, over thirty remains of fossil man, with extinct fauna; all the skulls but one long, high, and narrow (hypsi-encephalic).

Rio Caracalla, Argentina, pampas fossil relics like the above, but one skull short; significance doubtful.

Samborombón, South-east Buenos Aires, fossil skeleton found 1882, with *Scelidotherium* at a higher level.

Combe Capelle, Dordogne, complete skeleton found 1909 in a cave between the Mousterian and Solutrean strata; thought by Professor Klaatsch to be a distinct species (*Homo aurignacensis*) allied to the orang-utan, while the Neanderthal is closely related to the gorilla. These two would therefore represent two different human species or genera.

Heidelberg, fossil lower jaw found 1907 at Mauer, six miles south of Heidelberg; might be ascribed to an anthropoid ape but for the teeth, which are quite human. Next to *P. erectus*, it was the earliest human relic yet discovered, of Pliocene or more probably very early Pleistocene age; massive aspect; no chin; more primitive in some respects than the anthropoids. The Heidelberg fragment belongs to the 'Chellean' period, and is evidently much earlier than the Neander-Spy man. Its ape-like character is well seen in the arch of the teeth, which, instead of being semicircular, is in the form of three sides of a parallelogram. It has been named *Homo heidelbergensis*.

Corrèze, fossil skeleton found 1909 in La Chapelle-aux-Saints Cave, Corrèze district, Central France, with extinct fauna (woolly rhinoceros, &c.); of Mousterian period; skull like Neanderthal, extremely shallow and domeless, with retreating forehead, thick, prominent brow-ridges, and huge brain-cap much longer and broader than modern ones, about 1600 c.c., the average European being only 1500 to 1600. Formerly the estimate for the Neanderthal was only 1200, being based on the reduced volume due to the flatness of the skull; but an ordinary European skull as long and broad as the Neander-Corrèze would be about 2000 c.c.; yet the Neanderthal was actually a little bigger than the modern in some parts, but smaller in others. A later estimate for the average Neanderthal brain is 1450 c.c.

Gibraltar, found 1848, is of the same type as Neanderthal men, hence belongs with it to Schwalbe's *Homo primigenius* group; is the only one that shows the face in a perfect state; jaws very wide, but not longer than the modern European; upper jaw projects less than the Corrèze; the lower is very remarkable, owing to the retreating chin and the large size of the articulation with the skull; thick and large brow-ridges; and, like the Corrèze, the skull as a whole resembles the Eskimo.

Coldrum, near Maidstone, Kent, six skulls, and near them many other human remains, found 1910, lying without order, and apparently cut up before burial.

Atwick, near Biggleswade, North Bedfordshire, two skeletons (male and female) found November 1910 in or near the bed of the old river Ivel. The male seems to have been a chief of splendid physique, and the position of the woman suggests that she was slain and buried with him.

Cro-Magnon Cave, Eyzies district, Dordogne, numerous remains of more advanced type than Heidelberg or Neanderthal man, hence classed for a time either as very late *Palaeolithic* or very early *Neolithic*, Cro-Magnon being taken as a sort of connecting-link between these two periods. It is now beyond doubt, however, that this race (the 'Cro-Magnon race') is Upper *Palaeolithic*. It is common in the Aurignacian period.

St Brelade, Jersey, a number of teeth with strongly developed roots, found in a cave-dwelling in 1910, have been assigned to the Neanderthal race and the Mousterian culture.

The *Ipswich* man, found over a mile north of Ipswich in October 1911, was lying in glacial sand under the chalk-boulder clay. It was therefore claimed for it that except the Heidelberg jaw it was the oldest yet found in Europe; but it belongs to a much higher and less primitive type than the Neanderthal remains—'barely prehistoric' according to Professor Boule.

Pitldown, 1913. See *BOANTHROPUS*.

Wadjak, Java, two skulls (male and female), found in 1890, and described in 1921 by Dubois; regarded as Pleistocene on slight evidence; dolichocephalic; keeled cranial vault; receding forehead; superciliary ridges prominent; low orbits; jaw massive—as strong as the Heidelberg; woman's skull about 1550 c.c. (above European average or Australian maximum). *Homo wadjakensis* is regarded as a proto-Australian, indicating an East-Asiatic origin.

Talgai, on the Darling Downs, Queensland, found in 1884, described in 1914 and 1918; a boy's skull; face of Australian type, with primitive characters; 'a proto-

Australian who had long possessed a human brain, but whose face retained much more brute-like relics of his origin' (Boule).

Oldoway, East Africa, almost complete skeleton found in volcanic tuff, 1914; skull large, dolichocephalic, of negroid type.

Boskop, Transvaal, portions of skull, lower jaw, and long bones found in 1914, if really Pleistocene, 'reveal the existence in Africa of a generalised type, not lacking affinity with certain men of our own *Palaeolithic*, but already quite definitely negroid in character. At the same time they seem to furnish a new proof of the high antiquity of the human race, even in the countries it inhabits at the present day' (Boule).

Broken Hill, Rhodesia. See *BROKEN HILL*.

THE PALÆOLITHIC OR OLD STONE AGE.—Leaving out of account an obscure and not yet clearly defined *Eolithic* Age, and taking our starting-point from *Pithecanthropus erectus*, we find that the whole of the vast epoch (scarcely less, if less, than 500,000 years) which covers the early or prehistoric evolution of man comprises two great periods—the *Palaeolithic* or *Old Stone*, and the *Neolithic* or *New Stone, Age*. Dr W. Branca speaks even of a million years: 'Almost a million of years would seem to have elapsed before these "lords of creation" thought of giving their rude implements (clubs, &c.) a more convenient form' (*Fossil Man*, p. 80). It has been satisfactorily established that the former, which greatly exceeded the latter in duration, was not stationary, but made considerable progress in cultural development even in somewhat early times. In this progressive development seven stages (or eight, if Azilian, &c. be included; see below) are commonly distinguished, where, however, allowance must be made for much overlapping in different parts and even in the same region. Many anthropologists indeed prefer to call them 'cultures' or 'industries' rather than 'periods.'

Lower Palaeolithic, chipped flints, mostly round or oval, with or without cutting-edge and grip for handle. Their great age is shown by many which are deeply patined right through in various colours by natural agencies. This type is found almost everywhere in both hemispheres as far north as the Arctic Circle. Great numbers occur on the plateau formations through which the rivers have since eaten their way for scores and even hundreds of feet down to their present levels—that is, in milder pre-glacial or inter-glacial Pliocene or early Pleistocene times, when man lived in the open air more than in caves, and when the climate was everywhere warm or subtropical even in the higher latitudes. But later came the Cavern periods, when man resorted to the caves, as the third Ice Age set in.

1. *Pre-Chellean*, in which some recognise subdivisions, as Reutelian, Maffian, Mesvinian, Strepyan. Rude *coups-de-poing* (hand-axes) and stone picks are found, as well as very crude knives and scrapers. The human workmanship of many is doubtful.

2. *Chellean*, named from Chelles on the Marne, a few miles above Paris. Implements similar to Pre-Chellean, but better made; long, pointed *coups-de-poing*; rude scrapers and awls.

3. *Acheulean*, named from St Acheul (Amiens). *Coups-de-poing* become more even of edge, sometimes twisted; broad, oval tools become more pointed; the 'Levallois flake' appears.

4. *The Mousterian, or Mousterian*, from Le Moustier Cave, on the Vézère affluent of the Dordogne, above Les Eyzies. This is the *First Cave Age* proper. The Chelleans and Acheuleans had used chiefly the core that was left of a flint nodule when flakes had been removed. Neanderthal man of the Mousterian culture preferred to trim and use the flakes themselves. The *coup-de-poing* is going out of use. The 'Mousterian points' are spear-headed flakes, smooth and flat on one side, pointed and edged on the other; the scraper is treated the same way, but with edge more on the side than at the end, as in all later artifacts; these occur at great depths in the caves in long association with a fauna adapted to a cold climate, most of the earlier forms having already disappeared. The Mousterian is sometimes called *Middle Palaeolithic*.

Upper Palaeolithic; a vast variety of implements far

in advance of Lower Palæolithic; graters, end-scrappers, &c.; long, parallel flaking instead of 'resolved' (small) flaking; bone (formerly used only for anvils and the like), now made into borers, spatulae, &c. The climate is still cold, but gradually approaches present-day conditions. New races of man (Cro-Magnon, Grimaldi, Chancelade), similar to the races of the present day.

5. *Aurignacian*, from Aurignac on the Garonne. This culture, probably derived from the Capsian of North Africa, is sharply marked off from all that went before it in Europe. For the marvellous art of the Aurignacians and Magdalenians, see ART.

6. *Solutrean*, from Solutré Cave, Mâcon district, Saône-et-Loire. This is an intrusive culture which does not reach all parts of the Aurignacian area. Art languishes, but the technique of flint shows a great advance, with typical flints of the beautiful 'laurel-leaf,' 'willow-leaf,' and other highly finished patterns, for variety and perfection of form never since surpassed, indeed unsurpassable in stone; large, thin spear-heads; scrapers with edge on the end; flint knives and saws, all still chipped, never ground or polished; bone or horn awls or borers, also flaked.

7. The *Magdalenian*, or *Magdalenian*, from the La Madeleine rock-shelter on the Vézère between Le Moustier and Les Eyzies; a very long epoch, with numerous stations whose varied contents show resumption or continuation of Aurignacian art and general culture—scrapers, graters, saws, and knives of flint flakes; borers, needles, harpoons, hooks, and diverse ornaments of bone, horn, and ivory; with etchings of seals, fishes, mammoths, reindeer, and other animals. From the abundance of the last-mentioned, this has been called the 'Reindeer Age.'

There are certain civilisations sometimes classed as Upper Palæolithic which show a transitional character—*Azilian* (named from Mas d'Azil in Ariège), *Maglemosian* (from Maglemose in Denmark), *Tardenoisian* (from Fère-en-Tardenois). The Azilian-Tardenoisian people made inferior implements of stone and bone. Minute flints (perhaps inserted as teeth in a wooden shaft) become common. Instead of round harpoons of reindeer horn, they had flat harpoons of red-deer horn. Mysterious painted pebbles were treasured by them. It is suggested that these people were being pushed westwards, like the Maglemosians farther north, by Neolithic incomers.

Many evidences have been brought to light of the presence of primitive man in the caves and elsewhere in Britain. The earliest recorded are those of Gray's Inn Lane, London, which yielded a pointed flint about 1680, associated with the bones of an elephant, and Hoxne in Suffolk, where some palæoliths were found in 1797 also with the relics of huge extinct fauna. In the Hatfield beds of East Anglia (Brandon, Thetford) occur late Tertiary flint-bearing deposits of great extent and at depths of 50 or 60 feet. More important were the varied contents of Kent's Cavern near Torquay, which was explored between 1825 and 1894 by Buckland, M'Enery, and especially Pengelly, and revealed hundreds of unpolished flints, needles, and other bone objects, with long-extinct faunas, such as mammoths, hyænas, cave-lions, cave-bears, reindeer, rhinoceros, machairodus latidens, &c. Near Kent's is the Brixham Cave, with similar contents; in Vale of Clwyd, North Wales, the Tremereichion Cave; in Derbyshire, the Creswell Caves; in Settle, Yorkshire, the Victoria Cave, flint spears, scrapers, bone awls, ironstone tools, &c., with cave-lion, hippopotamus, hyæna, rhinoceros. Like contents in the Lotherdale Cave near Skipton; the Pont Newydd Cave, Derbyshire; the Lifynnon and others in Vale of Clwyd; Ilford and Grays Thurrock in Essex; Erith and Crayford in Kent; Finchampstead Hill Gravels in Berkshire, very old pre-glacial 'eoliths'; Chalk Plateau, Kent, rolled and other rude palæoliths like the foregoing; Canterbury Gravel-Beds; Stoke Newington; Paddington, &c. Here are numerous eoliths and palæoliths of all types, many of which are so rude that they have been by some observers ascribed to a Tertiary

precursor. In any case, the wide range of Pleistocene man in Britain is placed beyond doubt.

Besides the above-recorded caves with human remains and works, many others have been brought to light, especially in Germany (*Gailenreuth*), Belgium, Spain, and Britain. Forty caves in the Liège district yielded some human bones, at first discredited, but now fully confirmed by Dr E. Dupont. In both of the Irish crannogs at Lagore, Co. Meath, and Lake Roughan near Dungannon, some human remains were found of very great age. Very valuable for the early development of human culture were the contents of the French cave at *Mas d'Azil*, and of that of *Altamira* in North Spain.

It may be inferred that the 'First Man,' as represented approximately by *Pithecanthropus erectus*, had already acquired sufficient mental and bodily characters to make his way over the globe when he set out on his first migrations. This early man could already use his hands to fashion his rude stone implements, and wield clubs and other tools ready to hand; he could walk erect, as shown by the above-described human femur, and had already occupied a relatively wide domain in Malaysia and perhaps Indo-China. He was also of the average height (5 feet 6 inches), and had a cranial capacity of not less than 900 c.c. Professor Osborn looks for the ancestors of man in the high plateaux of Asia or Europe. 'The arboreal theory of man's origin,' he says, 'has been given up.' 'His ancestors, if tree-living, left their trees in the middle of the period of the Age of Mammals.'

We cannot here trace the routes followed by our ancestral man, and it must suffice to say that he became the progenitor of the chief varieties of the human species which are all independently derived from Pleistocene ancestors in the several regions—Australasia, Eurafica, Eurasia—to which they migrated in Palæolithic times. Thus is explained the close resemblance of the great divisions of mankind, all sprung from nearly related proto-human Pleistocenes in the Old Stone epoch; while the differences are to be attributed to long separation in new environments, under varying climatic and other local conditions. It should be observed, however, that though they may be said to represent our ancestors, neither *Pithecanthropus* nor Neanderthal is regarded as being in the direct line.

Here it is to be noticed that it was mainly, if not altogether, as a tool-using animal that *Homo sapiens ferus* (Linné's name for the earliest type of primitive man) made his way round the globe and acquired unchallenged ascendancy over all other organisms. 'The moment that the forerunner of man employed extraneous objects intelligently with a purpose as tools and weapons he ceased to be an ape and became a man. We must believe that the first use of tools and the psychic emergence were coincident and interdependent. . . . The reduction of the claws, teeth, and jaws was a correlative variation due to the assumption of the prehensile function by the hands and the attaining of the erect attitude' (Alton H. Thompson). So, too, Darwin: 'As man gradually became erect, and continually used his arms and hands for fighting with sticks and stones, as well as for other purposes of life, he used his teeth and jaws less and less,' &c. Man was thus better able to survive in the struggle for existence, especially as the development of his mental faculties went on hand-in-hand with the improvement of his arms and weapons. The very effort to perfect the use of these implements taught him to think; and thus it was that the brain received a constant stimulus, with the consequent reactions, in both directions—that is, the increase of manual skill and the evolution of his thinking power. When it was discovered that chipped flints could be made by hand, a great step was made in cultural progress,

and a vast field of resources opened up to primitive man. The very first step towards the modification of natural products marked 'his complete emergence from the animal stage. From this point on his mental evolution was rapid' (Thompson). It is thus seen that from the very dawn of human awakening 'the tool sense has been the power that dictated mental evolution' (*ibid.*). It would be idle to ask which came first, the mind or the brain, as it must now be obvious that both went *pari passu* together, since the two (function and organ) are interdependent one on the other. 'Organ and function are developed together; neither creates the other' (Keane).

THE NEOLITHIC OR NEW STONE AGE.—Although the Neolithic Age was much shorter than the Palæolithic, it was still of very great duration. During such an epoch there was necessarily a good deal of overlapping, so that it is not always easy to draw a clear line of demarcation between the two periods. In fact the line between Lower and Upper Palæolithic is much sharper. Some arts and crafts supposed to be exclusively Palæolithic have been carried on far into what are admittedly Neolithic times, even indeed to the present day; but when the question is viewed as a whole, it is seen that later periods present some marked features which are quite unknown to the Palæolithic. Such especially are the dolmens, menhirs, circular and other stone structures, and later a more or less extensive familiarity with the metals—tin, copper, bronze alloys, and iron, in the order named. Other differences are the practice of agriculture, the domestication of animals, making of pottery, more general use and control of fire, and the stone objects themselves, formerly chipped only, later polished and of more varied types, as in the here appended comparative table of Palæolithic and Neolithic culture:

OLD STONE AGE.

Climate—Warm at first, cold later.

Fauna—Mammoth, hippopotamus, cave lion and bear, hyena, reindeer; no domestic animals.

Human Types—Mainly dolichocephalic or long-headed. Heidelberg and Neanderthal types are succeeded in later times by modern man.

Fire—At first known only, later partly under control.

Food—At first mainly vegetable, later animal also, obtained by hunting and fishing only, and perhaps mostly eaten raw.

Cultivated Plants—None.

Industries—Limited to rude clubs, chipped stone, bone and horn later, of various early types, never ground or polished; no pottery, but later artistic sense very highly developed.

Monuments—None; no houses, graves, or burial at first; some 'tectiform' designs have been interpreted as architectural drawings.

Religion—Cave art has probably a religious or magical meaning; images of what seems to be a mother goddess.

Speech—At first articulate, later crude or inorganic.

NEW STONE AGE.

Climate—Cold at first; warm, or as at present, later.

Fauna—Mainly as at present; bear, fox, beaver; horse, dog, ox, sheep, goat, swine, and other domestic animals numerous.

Human Types—Both long and brachycephalic (round or short) headed, generally mixed as at present.

Fire—Under full control.

Food—Omnivorous as at present, mostly cooked, and obtained by hunting, fishing, tillage, and stock-breeding.

Cultivated Plants—Numerous (cereals, pulse, fruits, &c.).

Industries—Polished stone implements of diverse types; pottery; basketwork; spinning; weaving; mining; artistic sense debased.

Monuments—Monolithic and megalithic numerous; houses, pile-dwellings, barrows, tombs.

Religion—Animistic, spirit or ancestor worship; immortality.

Speech—Articulate and structural; stock languages numerous and of various types, irreducible to one origin.

Africa, and it is equally, some will say more, certain that others reached Europe from Asia. We have therefore two fundamental elements—the Eurafrians and the Eurasians—who have long been fused in the present European populations.

Assuming this twofold occupation of Europe from the south and east, the question arises, what has become of the various forms of speech that should represent these Eurafrian and Eurasian intruders? At present, and indeed throughout the historic period, with a few trifling exceptions, only one linguistic family is in possession of the continent—that is, the so-called 'Aryan' or 'Indo-European,' comprising the *Hellenic* in the south-east, the *Italic* in the south and west, the *Keltic* in the extreme west, the *Teutonic* in the centre, north, and north-west, and the *Letto-Slavonic* throughout the east. These are all sister-languages, which are derived unquestionably from the long-extinct Aryan mother-tongue, and have been in possession of nearly the whole continent from time out of mind. Whatever their origin, whether Asiatic, Eurasiatic, or European, as is now often held, they have made a clean sweep of all their Eurafrian forerunners, which are now represented only by the solitary *Basque* of the Western Pyrenees, which is undoubtedly of Iberian—that is, Eurafrian—origin. All the other Eurafrian tongues—Ligurian, Pelasgian, and possibly others—have disappeared, or rather have been absorbed or assimilated to the dominant Aryan, which has thus remained the unrivalled mistress of the continent from prehistoric—that is, Neolithic—times. The phenomenon is remarkable, but by no means unique, for analogous expansions of powerful linguistic families have occurred elsewhere, as in Africa, where the conquering Bantu tongue prevails almost without a rival from about the equator to the extreme south. Most archaeologists postulate a Mediterranean race, largely African, but extending to the British Isles; an intrusive Eurasian Alpine or mountain race; and Nordic or Teutonic invaders from the northern forest-lands.

Consult Broca, *Caractères physiques de l'Homme Préhistorique* (1868); Boyd Dawkins, *Early Man in Britain* (1880); Darwin, *Descent of Man* (1871); Dupont, *L'Homme pendant les Ages de la Pierre* (1872); Sir J. Evans, *The Ancient Stone Implements of Great Britain*; Frazer, *The Golden Bough*; Haeckel, *Evolution of Man* (1904); Keane, *Man, Past and Present* (1899; new ed. 1920); Lord Avebury, *Prehistoric Times* (1890); Sir Charles Lyell, *Antiquity of Man* (1863); G. de Mortillet, *Le Préhistorique* (1883); Frichard, *The Natural History of Man* (1848); De Quatrefages, *The Human Species* (1879); Romanes, *Mental Evolution in Man* (1888); Schrader, *Prehistoric Antiquities of the Aryan Peoples* (1890); Topinard, *Éléments d'Anthropologie* (1885); Tylor, *Primitive Culture and Anthropology*; Waitz, *Anthropologie der Naturvölker* (1864); Sir D. Wilson, *Prehistoric Man* (1863); Marett, *Anthropology* (1912); A. C. Haddon, *History of Anthropology* (1912); Geikie, *Antiquity of Man in Europe* (1914); Keith, *Antiquity of Man* (1915); Obermaier, *El Hombre Fósil* (1916); Déchelette, *Manuel d'Archéologie Préhistorique Celtique et Gallo-romaine* (1908-14); Osborn, *Men of the Old Stone Age* (New York, 1918); R. Moir, *Pre-palæolithic Man* (1920); J. M. Tyler, *The New Stone Age in Northern Europe* (1921); Burkitt, *Prehistory* (1921); Macalister, *Text-book of European Archaeology* (1921 et seq.); Boule, *Fossil Men* (trans. 1923). In *Ancient Hunters and their Modern Representatives* (new ed. 1924), Professor Sollas maintains that the Mousterians survive in the native Australians, the Solutreans in the Bushmen, the Magdalenians in the Eskimo and perhaps the American Red Indians. See also the articles ANTHROPOID APES, ART, MAN, ETHNOLOGY, IMAGES, MAGIC, SKULL, PITHECANTHROPUS, PLEISTOCENE, POST-GLACIAL SYSTEM, STONE AGE.

Anthropometry, the measurement of the dimensions and proportions of the human body

It must now be asked, whence did these Neolithic peoples really come? The question bristles with difficulties; but if it can be properly solved, it will help to explain the tangled web of the present mixed European peoples. It is allowed, or it can be proved, that many came from North

for comparison or identification. Cranial measurements (see SKULL) vary so much within the same tribe as not to be of themselves sufficient data on which to rest generalisations. Quetelet defined the general types of mankind by measuring height, weight, complexion, and the like. French anthropologists adopted a form of schedule containing as many as 102 different observations of a single individual. Collignon reduced these for practical use to about 20. The French police first systematically employed anthropometric methods for the identification of criminals, carefully recording for future use the various measurements (see BERTILLON, FINGER-PRINTS).

Anthropomorphism, the application to God of terms which properly relate to the bodily or mental qualities of human beings. Thus even in the Scriptures we read of the eye, the ear, the arm, the hand of God; and of his remembering and forgetting. In Exodus, God rests and is refreshed. The Audæans, a 4th-century Syrian monastic sect which sprang up, were accused of holding that God was possessed of a human shape. Hobbes and Priestley ascribed to the Divine Being a sort of subtle body. Spinoza was resolutely anti-anthropomorphic in all his thoughts of God. Fichte rejected the very doctrine of the personality of the Divine Being as anthropomorphic, and represented God as the moral order of the universe. Pantheism is at the opposite pole from anthropomorphism; Theism implies at least intellectual and moral kinship between God and man; Mansel's doctrine of the relativity of knowledge was not unjustly held to cut at the roots of faith.

Anthropophagi. See CANNIBALISM.

Antiar (Javanese *Antschar*), the Upas (q.v.) tree; Antiarin is its poisonous principle. Antiar Resin is a non-poisonous product of the same tree.

Antibes (anc. *Antipolis*), a small seaport in the French department of Alpes Maritimes, $7\frac{1}{2}$ miles E. of Cannes; pop. 12,000. The *Antibes Legion*, a body of foreign troops, chiefly French, kept by the pope during the French occupation of Rome, was formed here.

Anti-burghers, the name of a former religious denomination in Scotland; see UNITED PRESBYTERIAN CHURCH.

Antichlor, any substance, such as hyposulphite of soda, used to remove from paper pulp the last traces of free chlorine; see PAPER.

Antichrist, a name which occurs only in the epistles of St John, was very variously applied by Christians either to false Christs, actual or hypothetical, to heretics, or to various enemies of Christianity and the people of God. The meaning of the word was modified by elements taken from the 'Man of Sin' in 1 Thessalonians, from the Beast in the Apocalypse, from traditions of Antiochus Epiphanes, from anti-Messianic conceptions derived from the Jewish Apocalypses, and from Satan himself, the enemy of mankind. The idea became complex and not fully self-consistent, and was applied as the hatreds and fears of the church or the sects at various times suggested. Thus it was by some directly identified with heathenism or with the devil; with the Roman power; with the Emperor Caligula, or more especially Nero (see APOCALYPTIC NUMBER); with Simon Magus, Mohammed, the Grand Turk; with Napoleon I. and Napoleon III., or with a great enemy of God's people who was yet to appear before the end of the world; and for long it was a mark of Protestant orthodoxy to refer the term simpliciter to the Pope.

See for details, sources, and bibliography, Bousset, *Antichrist* (1895; trans. by A. H. Keane, 1896).

Anticline (Gr. *anti*, 'against,' *klinō*, 'I bend'), in Geology, applied to strata which are inclined in opposite directions from a common axis—that is, in a roof-like form. *Saddleback* is another term used for the same structure. *Syncline* (Gr. *syn*, 'together,' and *klinō*) is the converse of anticline, and is applied to strata which are inclined in

a, Anticline; s, Syncline.

opposite directions towards a common axis. Anticlinal and synclinal structures have resulted from the lateral compression and consequent folding of formerly horizontal or approximately horizontal strata. See under GEOLOGY, MOUNTAINS.

Anti-corn-law League. See CORN-LAWS.

Anticosti, an island in the Gulf of St Lawrence, which it divides into two channels, with lighthouses at different parts of the coast, and about 140 miles long, and 30 miles broad in the centre. The hills in the interior rise to about 600 feet. Anticosti has two good havens, one at Ellice Bay, near the western end, and the other at Fox Bay, in the NW. The climate is severe; while the surface is an alternation of rocks and swamps. It is visited by fishermen in the summer, but there are hardly any inhabitants save lighthouse-keepers and a few officials. The island, which is attached to the Canadian province of Quebec, has considerable salmon, trout, cod, and herring fisheries, and is a resort for seal and bear hunting. Marl and extensive peat deposits are found. In 1895 the island (area, 2600 sq. m.) was purchased by M. Menier, of chocolate fame, and stocked as a game preserve. In 1926 he sold it to a paper-pulp company.

Anticyra, (1) the modern Asprasipia, an ancient Greek town in Phocis, built on a peninsula in a bay on the Corinthian Gulf. In its neighbourhood grew the best hellebore, a sovereign remedy with the ancients for madness, hence the well-known proverb, *Naviget Anticyram* ('Let him sail to Anticyra'), spoken of a person when he acted senselessly.—(2) A town of Thessaly, on the Sinus Maliacus, also noted for its hellebore.—(3) A town of Locris, at the entrance of the Corinthian Gulf, often confounded with the Anticyra in Phocis. Horace (*Ars Poetica*, 300) speaks as if all three places produced hellebore, *Tribus Anticyris caput insanabile* ('a head not to be cured by the three Anticyras').

Antidote (Gr., 'given against'), a counterpoison. See POISONS.

Antietam, a narrow but deep river in Maryland, United States, falling into the Potomac 7 miles above Harper's Ferry. On its banks, near Sharpsburg, was fought a bloody battle between the Union troops under McClellan, and the Confederate army under Lee, in which the former remained master of the field, though at a loss of nearly 13,000 men.

Antifebrin, or ACETANILID, $\text{CH}_3\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_5$, a white colourless powder, with burning taste, is almost insoluble in cold water, though readily soluble in alcohol. It is derived from anilin by the action of glacial acetic acid. It is used medicinally for reducing temperature in fevers, but requires very careful use, as several deaths have occurred after administration. It is very similar

to antipyrin in action, but is more powerful and less dangerous.

Antig'one, daughter of Œdipus by his own mother Jocasta, and sister of Eteocles, Polyneices, and Ismene. She accompanied her father in his exile to Colonus in Attica, and after his death returned to Thebes. When her brothers, Eteocles and Polyneices, had both fallen in single combat, and Creon had forbidden on pain of death the burial of the latter, Antigone alone dared disobey. She covered her brother's body with earth, and was in consequence shut up in a subterranean cave, where she perished. Her lover, Hæmon, son of Creon, destroyed himself beside her corpse. Antigone, as the ideal of feminine duty and filial devotion, has been immortalised by Sophocles in his noble tragedies, *Œdipus at Colonus* and *Antigone*. Æschylus's tragedy upon her story is lost, but she figures in his *Seven against Thebes*, and in the *Phœnissæ* of Euripides.

Antig'onus, surnamed the 'One-eyed' (*Cyclops*), one of the generals of Alexander the Great, received in the division of the empire, after the death of the latter, the provinces of Phrygia Major, Lycia, and Pamphylia. After the death of the regent Antipater in 319, he aspired to the sovereignty of Asia, and waged incessant wars against the other generals, making himself master of all Asia Minor and Syria. In 306 he assumed the title of king, but was defeated by Lysimachus, Cassander, and Seleucus in the decisive battle of Ipsus, in Phrygia, in which he was slain, 301 B.C. He was the father of Demetrius Poliorcetes.

Antigonus Gon'atas, son of Demetrius Poliorcetes, king of Macedonia, and grandson of the great Antigonus. He did not mount his throne until 276 B.C., about seven years after his father's death. Driven out of his kingdom in 273 by Pyrrhus of Epirus, he recovered it in the following year, and kept it until his death in 239. See monograph by Tain (1913).

Antig'ua, the most important of the Leeward Islands (West Indies), is 28 miles long and 14 wide, and in Boggies Hill attains a maximum altitude of 1328 feet; area, 108 sq. m.; pop. (1911) 31,400. Antigua was discovered in 1493 by Columbus, who is said to have named it after a church in Seville, called Santa Maria La Antigua. It was first settled by a few English in 1632, having till then remained, in fact, uninhabited on account of the great scarcity of fresh water. A number of colonists were sent here by Lord Willoughby, to whom Antigua was granted by Charles II. in 1663. For a time occupied by the French, it was declared British by the Treaty of Breda (1667). Antigua is the seat of the governor, executive and legislative councils, of the Leeward Islands; of the legislative council (with eight official and eight unofficial members) of the Antigua presidency; and of an Anglican bishop. It has suffered severely from earthquakes—in 1689, 1843, and 1874; and from hurricanes, as in 1899. The average rainfall is 44 to 45 inches. Numerous islets, rocks, and shoals border the shore, rendering access difficult and dangerous. St. John, the chief town (pop. 8000), stands at the head of a safe and capacious bay in the north-west, which unfortunately does not admit large vessels, as can English Harbour, near Falmouth, on the south coast.

Sugar is the principal product and manufacture; syrups, cotton, limes, pine-apples, and onions are also exported. With Barbuda and Redonda, Antigua forms one of the five presidencies of the Leeward Islands. Crown colony government was introduced in 1898. The annual value of imports, as of exports, ranges from £100,000 to £300,000. The population of the presidency in 1911 was 32,300, over 30,000 being black or coloured.

Anti-Jacobin. See CANNING, FRERE.

Anti-Lebanon. See LEBANON.

Antilegom'ena (Gr., 'spoken against'), a term applied to those books of the New Testament not at first accepted by the whole Christian Church, but ultimately admitted into the Canon—the seven books of 2 Peter, James, Jude, Hebrews, 2 and 3 John, and the Apocalypse. The other books were called *homologoumena* (Gr., 'agreed to'). See BIBLE, and the articles on the books named.

Anti-Libanus. See LEBANON.

Antilles, a term applied to the whole of the West Indies (q.v.) except the Bahamas. A hypothetical island, Antilia, had figured in old sea-charts as early at least as 1424; and that name was applied in 1493 by Peter Martyr d'Anghiera to the West Indies. The Greater Antilles are Cuba, Jamaica, Hayti, and Porto Rico; the others are known as the Lesser Antilles.

Antimony—symb. Sb (Lat. *stibium*); equiv. 120—is a brittle metal of a flaky, crystalline texture and a bluish-white colour. It is readily reduced to powder by ordinary pulverisation; when heated to 1168° F. (631° C.) it fuses, and being allowed to cool, solidifies in rhombohedral crystals, which are isomorphous with those of arsenic. Heated to 2462° F. (1350° C.) in a retort, where the oxygen of the air is excluded, as in an atmosphere of hydrogen, antimony volatilises as the vapour of the pure metal. When raised in temperature in contact with the air, it burns with a white light—combining with the oxygen of the atmosphere, and forming copious white fumes of the sesquioxide of antimony, or 'flowers of antimony.' The metal is a bad conductor of heat and electricity, but may be used, in conjunction with bismuth, in the construction of thermo-electric piles. Exposed to the air at ordinary temperatures, antimony does not tarnish or rust; and this property, combined with the hardness of the metal and of its compounds, renders antimony of essential service in the useful arts, in the composition of alloys, such as Britannia metal, type metal, pewter, and white or anti-fiction metal. Precipitated powder of antimony, called *antimony black*, has been used for giving an iron-like appearance to casts.

Stibnite, or gray antimony ore, the impure sesquisulphide of antimony, Sb₂S₃, is the principal source of the metal. This substance has long been employed in the East for darkening the eyebrows. Native antimony is found, but rather sparingly, associated with a few other metals. Antimony is smelted in France, where ore is found abundantly, in Germany, and in England, which gets ore from Sweden, Borneo, and elsewhere; it is known to exist in Italy, Spain, and China; and stibnite was formerly mined in Britain. Although the extraction of antimony from its ore is a simple matter, there are several processes employed. Sometimes 'crude antimony,' or purified sulphide of antimony, is produced by lixiviation as a first stage in the operation. From this there are two or three ways of obtaining the impure metal, called 'regulus of antimony.' This raw antimony, whether obtained from the purified sulphide or direct from the ore, requires a calcination to separate such impurities as arsenic, iron, lead, copper, and sulphur. In the English process of getting it direct, the ore is smelted along with some alkaline slag and old scrap-iron in crucibles. When the mixture is completely fused, it is poured into conical moulds, and the contents of these, after cooling, consist of impure antimony and a slag of sulphide of iron. There are several methods in use for purifying the raw antimony (regulus). One of the simplest is to charge each of a number of crucibles with this regulus along with

some soda, common salt, and pure oxidised antimonial ore. When heat is applied, the foreign metals become oxidised and scorified, and nearly pure antimony or star metal is obtained.

The compounds of antimony are numerous: with oxygen it forms (1) the *trioxide* of antimony, or *white antimony ore*, Sb_2O_3 , which enters into the composition of tartar emetic; (2) *antimony tetroxide*, Sb_2O_4 , which forms one of the components of Dr James's powders; (3) *antimony pentoxide*, Sb_2O_5 , a very insoluble compound, obtained by acting upon the metal with concentrated nitric acid. With sulphur, antimony forms the *subsulphide*, Sb_2S_3 , already referred to as a natural ore of the metal, and which when roasted at a temperature sufficient to fuse it, passes into the mixed sesquioxide and subsulphide of antimony known commercially as the *glass of antimony*, used for colouring glass and porcelain yellow. A native oxysulphide, of a pretty red colour, is called *red antimony ore*. When the ordinary sulphide of antimony is boiled with potash, or the carbonate of potash, it dissolves; and thereafter, on boiling, deposits a reddish-brown substance, known as *mineral kermes*. The liquid from which the deposit has fallen, if treated with hydrochloric acid, throws down an orange precipitate of *golden sulphide* of antimony.

There is also a chloride of antimony, SbCl_3 , prepared by heating sulphide of antimony and hydrochloric acid together, and which has the common name of *butter of antimony*. It is generally obtained as an oily liquid, of the consistency of melted butter, and of a golden-yellow colour. Mixed with olive oil, it is used by gunmakers as *bronzing salt*, to impart a yellow colour to gun-barrels.

Various compounds of antimony are used as medicinal agents, both in human and veterinary practice, especially the *tartar emetic*, a double tartrate of antimony and potash, $(\text{KSbOT})_2\text{H}_2\text{O}$, which is the active ingredient in antimonial wine, sherry constituting the bulk of the compound. Several cases have occurred where tartar emetic has been used criminally as a poison.

'Basil Valentine' (q.v.), in his *Triumphal Chariot of Antimony*, says, 'the shortness of life makes it impossible for one man thoroughly to learn antimony, in which every day something of new is discovered.'

Antino'mianism (Gr. *anti*, 'against,' and *nomos*, 'law'), the doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by advocates of the doctrine of justification by faith, as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi. and 2 Pet. ii. 18, 19, it would seem that a tendency to antinomianism had manifested itself even in the apostolic age; and many of the Gnostic sects were really antinomian, as were probably also some of the heretical sects of the middle ages; but the term was first used at the time of the Reformation, when it was applied by Luther to the opinions advocated by John Agricola (q.v.). Agricola had adopted the principles of the Reformation; but in 1527 he found fault with Melancthon for recommending the use of the law, and particularly of the ten commandments, in order to produce conviction and repentance, which he deemed inconsistent with the gospel. Ten years after, he maintained in a disputation at Wittenberg, that as men are justified simply by the gospel, the law is in no way necessary for justification or for sanctification. The 'Antinomian Controversy' of this time, in which Luther took a very active part, terminated in 1540 in a retraction by Agricola; but views more extreme than his were afterwards advocated by some of the English sectaries of the period of

the Commonwealth; and without being formally professed by a distinct sect, antinomianism has been from time to time reproduced with various modifications. It ought, however, to be borne in mind that the term has no reference to the *conduct*, but only to the *opinions* of men; so that men who practically disregard and violate the known law of God, are not therefore antinomians; and it is certain enough that men really holding opinions more or less antinomian, have in many cases been men of moral life. It is also to be observed that the term has been applied to opinions differing very much from each other. In its most extreme sense, it denotes the rejection of the moral law as no longer binding upon Christians; and a power or privilege is asserted for the saints to do what they please without prejudice to their sanctity; it being maintained that to them nothing is sinful; and this is represented as the perfection of Christian liberty. But besides this extreme antinomianism, than which nothing can be more repugnant to Christianity, there is also sometimes designated by this term the opinion of those who refuse to seek or to see in the Bible any positive laws binding upon Christians, and regard them as left to the guidance of gospel principles and the constraint of Christian love. Antinomianism usually originates in mistaken notions of Christian liberty, or in confusion of views as to the relation between the moral law and the Jewish law of ceremonial ordinances.

Antin'ous, a youth of extraordinary beauty, a native of Claudiopoliis, in Bithynia, the favourite of the Emperor Hadrian, and his companion in all his journeys. He was drowned in the river Nile, near Besa, in 122 A.D., perhaps through suicide, either from weariness of the life he led, or from a superstitious belief that his voluntary death would avert disaster from the emperor. The emperor's grief knew no bounds—he enrolled him among the gods; built in his honour Antinopolis on the ruins of Besa, as well as numerous temples in Bithynia, Arcadia, and elsewhere. Antinous became, on Hadrian's account, a favourite subject for art, and many statues, busts, gems, and medals exist, representing him as the ideal of youthful manly beauty, often also with the added attributes of deity. Some of these rank among the masterpieces of Roman art, especially the colossal statue in the Vatican representing the youth as Dionysus, with ivy crown and hanging locks; the statue in the Capitoline Museum; and the marble bust in relief in the Villa Albani. Antinous's relations with Hadrian form the subject of the well-known romances, *Antinous*, by George Taylor, and *Der Kaiser*, by Ebers. See Dietrichson's *Antinous* (Christiania, 1886).

Ant'ioch, the ancient capital of the Greek kings of Syria, and long the chief city in Asia, lies in a fertile and beautiful plain, on the left bank of the river Orontes, 14 miles from the sea. In ancient times by its navigable river and its harbour, Seleucia, it had communication with all the maritime cities of the West; while it became on the other hand an emporium for the merchandise of the East, for behind it lay the vast Syrian desert, across which travelled the caravans from Mesopotamia and Arabia. Thus through it passed the high-road between Europe and Asia. It received from Strabo the name of *Tetrapolis* ('four cities'), on account of three new sites having been built upon successively, and each surrounded with a wall. The city was erected by Seleucus Nicator about 300 B.C., and was the most splendid of the sixteen cities built by him in honour of his father Antiochus. In early times a part stood upon an island which has now disappeared. The rest was built partly on the

plain, and partly on the rugged ascent towards Mount Casius (*Jebel Okrah*), amid vineyards and fruit-trees. The ancients called it 'Antioch the Beautiful,' and 'the Crown of the East.' It was a favourite residence of the Seleucid princes, and of the wealthy Romans, and was famed throughout the world for its splendid luxury. Its public edifices were magnificent. The city reached its greatest glory in the time of Antiochus the Great, and under the Roman emperors of the first three centuries. At that time it contained 500,000 inhabitants, and vied in splendour with Rome itself. Nor did its glory fade immediately after the founding of Constantinople; for though it then ceased to be the first city of the East, it rose into new dignity as a Christian city. It was one of the earliest strongholds of the new faith—indeed, it was here that the name of *Christians* was first used. During the apostolic age it was the centre of missionary enterprise, and it became the seat of one of the four patriarchs. Ten councils were held here from 252 to 380. Churches sprang up exhibiting a new style of architecture which soon became prevalent; and even Constantine himself spent a considerable time here, adorning it, and strengthening its harbour, Seleucia. The downfall of the city dates from the 5th century. In 538 it was reduced to ashes by the Persian king Chosroes, but it was partly rebuilt by Justinian. The next important event in its history was its conquest by the Saracens in the 7th century. In the 9th century it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The Crusaders besieged and took it in 1098. At the close of the 13th century, the sultan of Egypt seized it. At present it has a population of 25,000, mostly Turks employed in silk-culture, eel-fishing, soap-making, and corn and oil production. Its modern name is *Antakieh*. It exhibits almost no traces of its former grandeur, except the ruins of the walls built by Justinian, and of the fortress erected by the Crusaders. It suffered from an earthquake in 1872. See a history by Bouchier (1921).

Antioch, in Pisidia, founded also by Nicator, was declared a free city by the Romans in the 2d century B.C., and made a *colonia* under Augustus, with the name *Cæsarea*; see Sir W. M. Ramsay's *Cities of St Paul* (1908).

Antiochus, the name of thirteen kings of Syria of the Seleucid dynasty. ANTIOCHUS I., surnamed Soter (reigned 281–261 B.C.), the first of the Syrian dynasty of the Seleucidæ, was the son of Seleucus, one of the generals and successors of Alexander. The murder of his father in 281 gave him the whole Syrian empire, but left him too weak to assert his right to Macedonia. Antiochus gained the name of Soter ('Saviour') for a victory over the Gauls, but fell in a subsequent battle with them in 261. —ANTIOCHUS II. (261–246), surnamed Theos ('God') by the Milesians, whom he freed from their tyrant Timarchus. On the death of Ptolemy, whose daughter Berenice he had been compelled to marry, Antiochus recalled his former wife Laodice; but she, in revenge for the insult which she had received, caused Antiochus to be murdered, along with Berenice and her son. Antiochus lost the provinces of Parthia and Bactria. —ANTIOCHUS III., surnamed the Great, the son and successor of Seleucus Callinicus, and grandson of the preceding, was the most distinguished of the Seleucidæ. He reigned from 223 to 187. He failed in his attempts to recover Parthia and Bactria, and waged war with success against Ptolemy Philopater, and though defeated in a great battle fought at Raphia near Gaza (217), he afterwards obtained entire possession of Palestine and Coele-Syria (198). In

this war he was assisted by the Jews, to whom he granted many privileges. Fearing the power of the Romans, Antiochus at length concluded a peace with Egypt, betrothed his daughter Cleopatra to the young king Ptolemy, and gave her Coele-Syria and Palestine as a dowry. He afterwards became involved in war with the Romans, who had conquered Macedonia; but he declined to invade Italy at the instigation of Hannibal, who had come to his court for refuge. He crossed over into Greece, but was defeated in 191 at Thermopylæ, and in 190 by Scipio at Magnesia. Peace was granted him only on condition of his yielding all his dominions east of Mount Taurus, and paying a heavy tribute. In order to raise the money, he attacked a wealthy temple in Elymais, when the people rose against him, and killed him (187 B.C.). —ANTIOCHUS IV. (175–164 B.C.), surnamed Epiphanes, fought against Egypt and conquered great part of it. He twice took Jerusalem; and, endeavouring there to establish the worship of Greek gods, he by his tyranny and sacrilege excited the Jews to a successful insurrection under their leaders Mattathias and his heroic sons, the Maccabees. —The last of the Seleucidæ, ANTIOCHUS XIII. (Asiaticus), lost his kingdom to Pompey, who made Syria a Roman province (65 B.C.).

Antiope. See AMPHION.

Antipædobaptist is a term derived from Greek words for one who objects to infant-baptism. See BAPTISTS.

Antiparos (anc. *Oliaros*), one of the middle Cyclades in the Ægean Sea, close to Paros. It is well cultivated and tolerably fertile, nearly 14 sq. m. in area, and contains about 500 inhabitants. Rich lead mines were discovered in 1872. Its wonderful stalactite grotto is not alluded to by any Greek or Roman writer, but has been well known since 1673. The entrance forms a wide natural portico on the south-west side of a mountain, from which the visitor reaches the first spacious vault by means of ropes and ladders. To go farther is still more difficult. At a depth of 918 feet under the entrance, the chief chamber is reached. It is 312 feet long, 98 wide, and 82 high, and is covered everywhere with the most wonderful stalactite and stalagmite formations.

Antipater, (1) a general highly trusted by Philip and Alexander the Great, left by the latter as regent in Macedonia when he crossed over into Asia, 334 B.C. He discharged the duties of this office with great ability, suppressing the insurrections in Thrace and Sparta; but he was about to be superseded by Craterus, through the influence of Olympias, when Alexander died. The government of Macedonia was assigned to him anew, in conjunction with Craterus; and soon after, he was called upon to defend himself against an alliance of the Grecian states. The war, usually called the Lamian war, from Lamia where Antipater was besieged in 323, was terminated by the defeat of the confederates in 322. The murder of his unsuccessful rival, Perdiccas, in Egypt in 321 B.C., left Antipater the supreme regency of the kingdom, and the guardianship of Alexander's children. He died at an advanced age in 319. —(2) The father of Herod the Great, appointed by Julius Cæsar procurator of Judæa in 47 B.C. He was poisoned in 43 B.C. —(3) The son of Herod the Great by his first wife, a worthless prince, who was perpetually conspiring against the life of his brothers, but was executed in prison five days before Herod died.

Antipathy is the term applied to a class of cases in which individuals are disagreeably affected by, or violently dislike, things innocuous or agreeable to the majority of mankind. These peculiarities are sometimes innate—James I.'s, for instance,

to a drawn sword; sometimes they are due to a child's having been injudiciously terrified with some object, the mental impression becoming permanent. In many cases, antipathy arises from mental association, often unconscious, of one object or impression with some other admittedly unpleasant, or with some painful experience in the past life of the person affected. A large class of persons have an antipathy to animal food, and from childhood refuse to taste it. In others, again, the aversion is limited to one kind of meat, as veal or pork; others are averse to eggs or milk. Nor is this feeling a conscious caprice, which an exertion of the will might remove; for it is generally found that contact with the object of the antipathy is resented by the bodily economy, and symptoms of poisoning are rapidly produced. Some are affected with these symptoms who have no mental aversion to the article. Some medicines affect particular persons dangerously, even when given in very minute doses; on others, medicines have a peculiar effect—astringents may purge. The air of some places has a peculiar influence on individuals.

The most remarkable antipathies are those affecting the special senses. Nearly all persons have a loathing at reptiles, but some few *faint on seeing* a toad or lizard, others on seeing insects. Tycho Brahe fainted at sight of a fox, Henry III. of France at that of a cat, and Marshal d'Albert at a pig. *Hearing* a wet finger drawn on glass, the grinding of knives, or a creaking wheel, is sufficient to produce fainting in some. *Smelling* musk or ambergris throws some into convulsions; and we have seen how articles of food affect others—often, no doubt, owing to perverted taste. The *touch* of anything unusually smooth has the same effect sometimes. Zimmerman records the case of a lady who was thus affected by the feeling of silk, satin, or the velvety skin of a peach.—Strong predispositions towards things, also of frequent occurrence, constitute a converse idiosyncrasy.

Antiperiodics are drugs which relieve or cure certain diseases (particularly ague, and some forms of neuralgia and headache) whose attacks occur at regular intervals. The chief are cinchona and its alkaloids (especially quinine), and arsenic.

Antiphlogistic (Gr. *anti*, 'against,' and *phlogizō*, 'I burn'), a term applied to remedies and to regimen opposed to inflammation, such as blood-letting, purgatives, low diet, &c.

Antiphon, the earliest of the ten Attic orators in the Alexandrine canon, born at Rhamnus in Attica, 480 B.C. He belonged to the oligarchical party at Athens, and to him, according to his pupil Thucydides, was mainly due the establishment of the government of the Four Hundred in 411 B.C. On its fall, six months later, Antiphon was brought to trial and condemned to death, in spite of his noble defence. Only fifteen of his orations have come down to us, of which three were written for others, while the remainder appear to have been intended as specimens of school-rhetoric for his pupils. The best edition is by Blass (1881); see Jebb's *Attic Orators* (2d ed. 1903).

Antiphony, the name of a species of sacred song, sung by two parties, each responding to the other. Many of the Psalms show that antiphonal singing was in use in David's time. Its introduction into the Greek Church is ascribed to Ignatius, Bishop of Antioch, in the 2d century; and Ambrosius, Bishop of Milan, is said to have introduced it into the Western Church, in the 4th century. The chanting of the Psalms in the English cathedral service is an imitation of the ancient antiphony.

Antipodes, a word of Greek origin, signifying, literally, those who have their feet over against

each other. Thus Trevisa, in 1398, says that 'in Ethiopia are the Antipodes, men that have their feet against our feet.' As applied in geography, the term means the inhabitants of any two opposite points of the globe, or, in other words, the dwellers at the opposite extremities of any diameter of the earth. From this primary relation there necessarily arise many secondary relations. Antipodes must be on one and the same meridional circle, separated from each other by half the circumference. Being on one and the same meridional circle, they must differ in longitude exactly 180°, with the exception of the poles themselves, as having no longitude at all; and being separated from each other by half the circumference, they must be equidistant from the equator in opposite directions. Take, as an example, London, in 51° 30' N. lat., and 0° 5' W. long. Its antipodes must be in 51° 30' S. lat., and in 180° 5' W. long., or rather 179° 55' E.—coinciding pretty nearly with Antipodes Island (49° 48' S.; 178° 20' E.), an uninhabited rocky islet, about 5 miles long, with smaller rocks around it, lying to the south-east of New Zealand.

Between antipodes in general there necessarily exist also other secondary relations. With reference to the earth's daily rotation, the noon of the one side must be the midnight of the other; while, with regard to its annual revolution, the summer and the autumn of the one side must be the winter and the spring of the other. The midnight corresponds to the noon on the other side, either of the day before or the day after, according as one has reached the antipodes sailing from the east or from the west. In going eastward—that is, in meeting the sun—one, from day to day, anticipates every noon and every midnight in the proportion of 4' of time to 1° of long., or of 12 hours of time to 180° of long. In going westward, again, one postpones every noon and every midnight in the same proportion.

Antipope, a pontiff elected in opposition to one canonically chosen. The first antipopes were Felix, during the pontificate of Liberius (352–366); Ursinus, against Damasus (366–384); and Laurentius, against Symmachus (498–514). During the middle ages several emperors of Germany set up popes against those whom the Romans had elected without consulting them. Otho the Great displaced successively two Bishops of Rome; and when the rival pope, Sylvester III., had expelled the simoniacal and profligate Benedict IX. (1033–45), the latter was brought back by the German king, and soon afterwards sold his dignity to Gregory VI. There were now, consequently, three popes, but their claims were all set aside at a council convened at Sutri by the emperor, Henry III., and a new pope elected as Clement II. in 1046. Shortly after, Pope Alexander II. found a rival in Honorius II., the nominee of the emperor; but his claim was ratified by a council convened at Mantua. In 1080 the same unseemly spectacle was witnessed, when the emperor, Henry IV., elevated to the papal chair Guibert of Ravenna, under the title of Clement III., in opposition to his own implacable adversary, Gregory VII. But after the death of Gregory (1085), Clement was himself opposed successively by Victor III. (1086–88) and Urban II. (1088–99). Innocent II. (1130–43) triumphed over the antipope Anacletus II. by the help of St Bernard; and Alexander III. during his pontificate (1159–81) had to contend with no fewer than four successive antipopes, the election of only one of whom, however, Victor V., in 1159, has any canonical validity. After a long contest, Clement V. was elected in 1305, and four years later he transferred his seat to Avignon, where his successors reigned for nearly seventy years, losing the while,

by their subjection to French influences, the sympathies of Germany and England. The election of Urban VI. in 1378 occasioned 'the great schism of the West,' which divided the church for fifty years. He was elected by the Romans, who demanded an Italian pope after the death of Gregory XI. The French cardinals, then a majority in the curia, on the plea that they had elected the pope only under intimidation, withdrew to Provence, and elected a new pope under the name of Clement VII., who was recognised by France, Spain, Savoy, and Scotland; whilst Italy, Germany, England, and the whole north of Europe, supported Urban VI. For thirty-eight years Christian Europe was scandalised by the spectacle of two popes, one at Avignon, another at Rome, in turn hurling the most awful anathemas of the church at each other, like 'two dogs snarling over a bone,' in Wyclif's phrase. At the beginning of the 15th century, an attempt was made to prevail on both the rivals, Gregory XII. at Rome, and Benedict XIII. at Avignon, to renounce their claims with a view to promote union, but both evaded this as long as possible. At length the cardinals of both sides summoned a general council at Pisa in 1409, which deposed both popes, and elected Alexander V. The council of Constance (1417) deposed the *three* who now claimed actually to be pope, and laid the schism by electing Martin V. (Colonna). The council of Basel (1431-47), in its struggle with Pope Eugenius IV. (1431-47) for supremacy, attempted to arrogate to itself the papal functions, and proceeded to elect Amadeus of Savoy pope, as Felix V. The attempt, however, failed; the popes Eugenius IV. and Nicholas V. (1447-55) secured their authority, the ambitious council finally dissolved itself, and Felix V. resigned his empty dignity, and was raised to the rank of cardinal by the magnanimous pope himself. This was the last occasion on which the faithful were distracted by the sight of a rival pontiff within Christendom. See POPE.

Antipyrin is obtained from coal-tar products by a process of great complexity, its chemical composition being $C_{11}H_{12}N_2O$. It is a white crystalline powder, colourless, and soluble in water, and has a slight bitter taste. It is a prompt and usually efficacious antipyretic, lowering the febrile temperature in about half-an-hour, with effects reaching the maximum in from two to five hours, and lasting from five to eight hours. As an analgesic it is prompt and effective in reducing pain, especially in all kinds of neuralgia; for rheumatism it is also often very useful. But it is not an antiperiodic, and therefore cannot replace quinine in cases of ague or intermittent fevers. As with antifebrin, cases of poisoning are not infrequent, the symptoms being giddiness, convulsions, and a livid colour of the skin.

Antiquaria. See ANTEQUERA.

Antiquaries, Antiquities. See ARCHÆOLOGY, ACADEMY.

Anti-rentism, a term applied to the action of a political party which caused considerable disturbance in the state of New York (1843-47) in connection with the non-payment of rent. Large tracts of land had been granted in old colonial days by the Dutch West India Company to its members in New York, who had the title or privilege of a lord 'patroon' or protector, and the colony or manor was governed by feudal tenures. Though the latter were abolished by laws enacted in 1779 and 1785, yet the proprietors managed to form a deed by which rents and dues should be paid as formerly. Associations were formed in 1839 to get rid of these burdens; evictions were tried by the proprietors, which led to resistance and outrages. Ultimately the legislature gave relief of a certain

kind to the tenantry, feudal tenures and incidents were abolished, and agricultural land was forbidden to be leased for a longer period than twelve years.

Antirrhinum. See SNAPDRAGON.

Antisana, a volcano of the Andes, in Ecuador, about 35 miles SE. of the town of Quito, 19,260 feet high. On its slopes are many extinct craters, and at a height of 12,400 feet, the famous Tambo de Antisana, one of the highest inhabited places in the world.

Antiscorbutics. See SCURVY.

Antisemites, the modern opponents of the Jews in Russia, Rumania, Hungary, Poland, and elsewhere. In these countries the Jews are found in great numbers, and their constantly increasing wealth and influence excite popular jealousy and alarm. The question how far it is advantageous for a country to allow excessive wealth and political power to pass into the hands of a race avowedly alien, and but little influenced by the sentiment of nationality, admits of discussion, but there can be no excuse for the brutal outrages upon innocent individuals that occurred in Russia and Hungary in the years 1881-84. Even in the enlightened capital of the German empire the *Judenhetze* raged hotly; and an Anti-Semitic League was formed in 1881 to restrict the liberty of Jews in Germany. The emperor interfered to stop the cowardly persecution, but not before thousands of Jews had left the country. The persecution in Russia assumed a more brutal character than in Germany, and thousands of Jews fled to America, Spain, and elsewhere; and a hideous outbreak took place at Kishineff in Bessarabia at Easter 1903. There were outbreaks in Poland during the confusion attending the re-establishment of national independence. French Anti-Semitism was illustrated in the Dreyfus case. See JEWS.

Antiseptics are substances which prevent or arrest putrefaction and analogous fermentive changes. It has been proved that Putrefaction (q.v.), fermentation of grape-juice (*vinous fermentation*), of milk (*lactic fermentation*), and many, though probably not all, other fermentations, depend upon the presence of microscopic vegetable organisms (see BACTERIA, GERM). To prevent these processes, then, it is necessary either (1) to exclude these organisms altogether; (2) to interfere with conditions which permit of their development; or (3) to destroy their vitality.

(1) These organisms, or their germs, are present in ordinary air; but it has been shown by Pasteur, Tyndall, Lister, Roberts, and others, that if air be filtered through cotton wool, or (if moving slowly) through a fine bent tube, it may be allowed to come in contact with putrescible substances, if these themselves contain no living organisms or germs, without causing putrefaction. This method, however, has had no important applications except in scientific research.

(2) Their growth may be arrested (*a*) by a low temperature. Thus large quantities of fresh meat, fruit, and vegetables are imported from distant countries, in chambers cooled to near the freezing-point. Carcasses of the long-extinct mammoth, with the flesh still present, have been found in the ice-cliffs of Siberia. The longer time that meat, milk, &c. keep in cold than in hot weather is familiar. (*b*) By absence of moisture. Thus, if the contents of an egg be thrown out on a plate, and thoroughly dried in an oven, the whole becomes of a hard, horny consistence, and may be kept in this state for years. If soaked in water, it will soon begin to putrefy. In the same way meat may be kept fresh by thoroughly drying it. (The preservation of fruits, &c. in strong syrup is an example of a somewhat similar action.)

(3) The vitality of these organisms may be destroyed (a) by heat—e.g. meat and other eatables can be preserved for an indefinite time if they are boiled and hermetically sealed, while still hot, in tin vessels (see PRESERVED PROVISIONS; and for the pasteurisation of beer-bottles by heat, see BEER); (b) by means of various chemical substances. Some of the most important of these are common salt and saltpetre, used in curing fish, pickling meat, &c.; alcohol, in preserving zoological specimens, vegetable essences, fruits, &c.; sulphurous acid, boric acid, and arsenious acid; many salts, as chloride of zinc (Burnett's disinfecting liquid, q.v.), permanganate of potash (see under MANGANESE), corrosive sublimate, nitrate of silver; chlorine (given off by chloride of lime and from chlorine water), iodine, iodoform (CHI_3), glycerine, boroglyceride, eucalyptus oil, thymol, creasote, carbolic acid, salicylic acid, salol, naphthaline, camphor, oil of winter-green, oil of thyme, aluminium acetate, charcoal. All these substances act directly or indirectly as poisons to the organisms which produce putrefaction, &c.; most of them are either poisonous or very unpalatable to man, and cannot therefore be used in preserving food. Many of them are, however, used in the arts to arrest the decomposition of putrescible substances—e.g. in the manufacture of size for writing-paper from scraps of hides, sulphite of soda, containing sulphurous acid, is added; hides are preserved by salt, or, when tanned, by tannin, a compound of tannic acid; and timber is found less liable to decay if charged with an antiseptic, such as sulphate of copper, chloride of zinc, corrosive sublimate, or creasote. The timber is placed in a steam-box, so that the air contained in its pores is displaced by steam; the whole casing is then closed tight, and allowed to cool; the steam condenses and leaves a vacuum in and around the wood. If one of these substances is then introduced, it finds its way into the innermost pores of the timber (see TIMBER).

In brewing, bisulphite of lime is used as an antiseptic. Several of the above-named antiseptics are largely used in the preservation of food. Salicylic acid, boric acid, borax and boric acid, formalin, and acid sulphites have been employed for preserving beer, butter, fruits, &c. A committee of the Board of Agriculture in 1901 made the following recommendations as to their use in foods:

- (1) To prohibit formaldehyde or formalin entirely.
- (2) To limit the quantity of salicylic acid to one grain per pint or pound of food.
- (3) To prohibit preservative in milk.
- (4) That there be not more than one-quarter per cent. of boric acid preservative added to cream.
- (5) That the same preservatives be allowed for butter, but not more than one part in two hundred.
- (6) To prohibit preservatives in infants' and invalids' foods or drinks.
- (7) To prohibit the use of copper in preserved foods.

However, these recommendations have not yet been enforced, as there is still much difference of opinion regarding preservatives in food.

Next to the preservation of food, the most important purposes for which antiseptic methods and substances are used, are the *prevention of infectious diseases*, and the *treatment of wounds*. The properties of the infectious matter of infectious diseases are closely analogous to those of the organisms that lead to putrefaction, &c.; and even in cases where its organic nature has not been proved (see GERM), it can be rendered inert by a proper use of antiseptics, or by exposure to a high temperature. Thus, anything that has come near the patient suffering from an infectious disease, and discharges from his person, are made harmless by carbolic acid, chloride of zinc, or

some other antiseptic; his bedding is roasted in an oven at a temperature of 212°F . (100°C .), or more; the room where he has been treated is fumigated with chlorine or sulphurous acid; and so the disease is prevented from spreading. This is, in fact, one of the chief aims of medical practice at the present day (see DISINFECTANTS).

Many of the evil effects which follow wounds and surgical operations are due to the presence of organisms (see PYÆMIA); and the effects of their antiseptic treatment, introduced by Lister (then Dr Lister, have been marvellous.

Antiseptic or Aseptic Surgery is the system of treating surgical wounds introduced by Lister (q.v.), based on his clear recognition of the fact that the putrefactive process (*sepsis*) is the chief danger which the surgeon has to combat in dealing with accidental and operation wounds. The system consists essentially in excluding those microbes by which fermentative processes are induced, or in eradicating them from wounds to which they have gained access. In this way pyæmia, septicæmia, and such other forms of wound poisoning as erysipelas and gangrene, once the scourge of surgical hospitals, have in a short period of years become diseases of rare occurrence, and the reduction in hospital mortality has been very great. Carbolic acid dissolved in various menstrua, in the form of a steam spray, or impregnated in gauze or cotton-wool, was till recently the favourite antiseptic in surgical practice. Thymol, eucalyptus oil, boric and salicylic acids, and iodoform, are also in frequent use for the same purposes. In 1881 Professor Koch of Berlin drew attention to the much greater potency of perchloride of mercury (corrosive sublimate) as compared with other antiseptics, and his suggestion of its employment in a *pro mille* aqueous solution was ere long all but universally adopted with satisfactory results. Along with carbolic acid, which is still preferred for some parts of the method, this antiseptic is employed in destroying the infective particles or *germs* in the immediate neighbourhood of the wound. The wound itself is only treated with the germicide solution when the presence of germs within it is suspected, otherwise it is kept free from the irritative action of the lotion; but all objects approaching it must be rigorously purified by previous boiling; all instruments, sponges, or absorbent swabs must be boiled, and the surgeon's hands and clothing strictly sterilised.

Method of Operating and of Dressing Operation-wounds.—The skin of the part, the hands of the operator and his assistants, and the instruments are carefully purified with a watery solution (1 in 1000) of corrosive sublimate. Sponges, ligatures, and drainage-tubes are kept in carbolic acid solutions. The wound and its neighbourhood are frequently irrigated by boiled water during the continuance of the operation. When the operation is completed and the wound closed, it is covered with a layer of specially prepared oil-silk (protective), to prevent constant irritation by the antiseptic in the dressing. This consists of muslin impregnated with bichloride of mercury ('Lister's gauze'), so that the dressing remains in an actively antiseptic condition for some days till replaced by a new dressing, and thus prevents contamination of discharges from the wound. The first layer is wetted in carbolic acid solution (1 to 40) to destroy any germs adhering to its surface, and renders it actively antiseptic at once. The remainder is applied dry, in order to soak up the discharge as it flows from the wound. This dry dressing may be in part or wholly replaced by fine cotton wadding impregnated with salicylic acid, 4 per cent., its elasticity rendering it a more comfortable application, and permitting its close adaptation to the

hollows and prominences of joints, and to the contours of the body generally. The whole is fixed by bandages. The dressing is in general not changed till discharge becomes visible through it. When it is changed, similar precautions with regard to purification of hands, instruments, &c. must be observed.

Treatment of Wounds not inflicted by the Surgeon.

—They are washed out with a searching antiseptic solution, as watery solution of corrosive sublimate (1 in 500) or carbolic acid (1 in 20), and are thus at once thoroughly disinfected. They are then treated like operation-wounds. After forty-eight hours at furthest, if the wound is irritating or inflammatory, further treatment is needed. If that is so, the original disinfection must be repeated.

Results.—If this treatment is thoroughly carried out: (1) no bacteria and no putrid smell are present in the discharge; (2) no pyæmia, septicæmia, hospital gangrene, or erysipelas results; and in general (3) no formation of pus takes place; (4) no pain is felt in the wound; (5) no fever follows.

Some of the most striking effects of this method on surgical practice are: (1) In many cases of injury, especially compound fractures and dislocations, a limb may now be preserved where amputation was formerly considered necessary. (2) Many operations are now fearlessly and safely performed, which formerly were either not attempted, or were frequently followed by disastrous results; especially operations on bones and joints, and opening of Chronic Abscesses, and Serous Membranes (q.v.) (3) Mortality from injuries and operations has been greatly diminished—e.g. the death-rate after major amputations (in 1864 and 1866) fell from 45 per cent. to 15 per cent. (1867–69) in Lister's wards in Glasgow after he introduced his method, and to about 12 per cent. (in 1871–77) in Edinburgh, when he had further developed it. Volkman of Halle was on the point of closing his wards in consequence of the prevalence of pyæmia and septicæmia. He tried Lister's method, and during the next five years the total mortality in his wards was less than 6 per cent. The tendency of late is, instead of antiseptic treatment, involving the disinfection of the wound with chemicals, to rely on *Aseptic* methods—sterilising instruments, clothes, hands, and skin to be operated on beforehand. See Cheyne's *Antiseptic Surgery* (1882), and Gerster's *Rules* (New York, 1888); also SURGERY, WOUNDS.

Antispasmodics. See SPASM.

Antisthenes, founder of the Cynic school of philosophy, was the son of an Athenian father and a Thracian mother. He fought in his youth at Tanagra (426 B.C.), was first a disciple of Gorgias, afterwards a friend and follower of Socrates, and died at Athens at the age of 70. After the death of Socrates, he taught moral and practical philosophy in the Athenian gymnasium Cynosarges, from which it is said his school derived its title. Antisthenes held that virtue mainly consists in voluntary abstinence from pleasure, and in a stern contempt of riches, honours, and even learning. He showed his contempt for all the luxuries and comforts of life by eating the hardest fare and wearing ragged garments—an eccentricity which Socrates reproved with the words, 'I see your pride through the holes in your cloak.' Antisthenes attracted many imitators, among them Diogenes; and from his school possibly the Stoics sprang. His writings have mostly perished. See CYNICS, SOCRATES and books there cited, and STOICISM.

Antithesis (Gr. *anti*, 'against,' and *thesis*, from *tithêmi*, 'I place'), an opposition or contrast of ideas expressed by bringing words that are the natural opposites of each other close together so as to produce a strong contrast. Thus

Lessing, in a criticism on a book, says: 'It contains many good things and many new; but the good are not new, and the new are not good.' Antithesis, when naturally and moderately employed, gives liveliness to style; but, like all strong figures of speech, becomes wearisome when too often repeated, as it is in the sonorous prose of Dr Johnson.

Antitoxin, the name for substances present in the blood of an animal which have the effect of neutralising the action of bacterial poisons (toxins). As in the case of toxins, so with antitoxins—their chemical nature is not definitely known. See the articles BACTERIA, DIPHTHERIA, GERM, PTOMAINES, PYÆMIA, TUBERCLE, TUBERCULOSIS.

Antitrinitarians. See UNITARIANS, TRINITY.

Antitype, the person in whom any prophetic type is fulfilled. See TYPE (Theology).

Antium, one of the most ancient cities of Latium, built on a rocky promontory running out into the sea. Being favourably situated for commerce and piracy, it became, under the Volscians, one of the most powerful enemies of rising Rome. Conquered in 468 B.C., it soon revolted, and long maintained its independence, but was at length subdued in 338 B.C. It was deprived of all its ships, the beaks of which (*rostra*) were carried off to ornament the platform of the speakers in the Roman forum. It became a favourite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces; such as the Apollo Belvedere, and the Borghese Gladiator. It was the birthplace of the Emperors Caligula and Nero.

Antivari, an Adriatic seaport (formerly Albanian) assigned to Montenegro (q.v.) by the Treaty of Berlin in 1878. A railway runs N. (12 miles) to Vir Pazar on Lake Scutari. A Roman Catholic archbishop has his seat here. It has a citadel, and a small harbour; blockaded by international squadron 1913; occupied by Austria 1916. Pop. 2500.

Antlers, bony outgrowths from the frontal bones of almost all the members of the deer family. Except in the reindeer, they are restricted to the males, and are secondary sexual characters used as weapons in fighting for possession of the females. They appear as a pair of knobs covered with dark skin, from which the bony tissue is developed. In the year after that of birth, the antlers remain unbranched conical 'beams.' In the following spring, the previous growth having been meanwhile shed, the antlers grow to a larger size, and form their first branch or 'brow.' Year by year the number of branches or 'tines' increases, and more than sixty have been counted on some magnificent heads. The soft hairy skin which secures their rapid annual growth is known as the 'velvet,' and its accidental injury affects the development of the antlers. Growth ceases when the blood-supply is cut off by the development of a tubercled burr at the base, and the deer then rub off the dry skin and leave the bone bare. The antlers are shed, in many cases at least, annually, after the breeding period. The various types of antlers are used as convenient characters in distinguishing the different genera. Investigation of fossil forms has shown that the gradual development of antlers exhibited in the individual life of the deer is a recapitulation of their progressive historic evolution. See HORN, DEER, RED DEER, SEXUAL SELECTION, WAPITI.

Ant-lion, the larva of an insect (*Myrmoleon*) of the order Neuroptera, remarkable for the ingenuity of its insect-catching habits. It inhabits sandy districts, is not known in Britain, and is

more common in the south of Europe than in the north. Some species are common in North America. The perfect insect is about an inch long, and has a general resemblance to a dragon-fly. The grayish-yellow larva is rather more than half an inch long, it has a stout hairy abdomen, and a small head, which is furnished, however, with two very large incurved mandibles. It has six legs, but is incapable of rapid locomotion, and generally jerks itself backwards. It feeds upon the juices of insects, especially ants, in order to obtain which it cleverly excavates a funnel-shaped pitfall in sandy ground, and lies in wait at the bottom, often with all but its mandibles buried in the sand. When insects approach too near to the edge of the hole, the loose sand gives way, so that they fall down the steep slope. If they do not fall quite to the bottom, but begin to scramble up again, the ant-lion throws sand upon them by jerking its head,

Ant-lion, showing perfect insect, larva, and excavation.

and thus brings them back. It employs its head in the same way to eject their bodies from its pit, after their juices have been sucked, and casts them to a considerable distance; and by the same means throws away the sand in excavating its hole, first ploughing it up with its body, and then placing it upon its head by means of one of its fore-legs. It always begins by working round the circumference of its future hole, and gradually narrows and deepens it; turning quite round after each time that it works round the hole, so as to employ next time the fore-leg of the other side. When it meets with a stone which it cannot remove, it deserts the excavation and begins another. The pit is rather more than two inches deep. After about two years the larva spins its cocoon. The habit is seen at a lower stage of evolution in some species which simply bury themselves in the sand without making any pitfall.—The name of Ant-lion (*Myrmekoleon*) was long given to a fabulous beast, supposed to be the offspring of a lion and a female ant, and participating in the form and qualities of both parents.

Antofagasta, a port in the like-named province in north Chile (area, 46,400 sq. m.; pop. 172,000). Founded in 1870, the town owes its rapid rise to neighbouring saltpetre deposits, to the rich mines of Caracoles, and to its trans-Andine railway connection with Bolivia. It was taken from Bolivia in the war of 1879. Pop. 50,000. See ATACAMA.

Antonmarchi, FRANCESCO, the physician of Napoleon at St Helena, was also a native of Corsica, and was born about 1780. He was already an anatomist of some celebrity at Florence, when he was induced in 1818 to go to St Helena. Napoleon received him with mistrust, but ultimately

gave him his full confidence, and at his death left him 100,000 francs. After his return to Europe, he published at Paris his famous but scarcely trustworthy book, *Les Derniers Moments de Napoleon* (1823). During the Polish revolution, he did duty at Warsaw as director of military hospitals. He afterwards went to the West Indies, and died in Cuba, on the 3d of April 1838.

Antonelli, GIACOMO, cardinal, was born 2d April 1806, at Sonnino, a village situated near the Pontine Marshes. His father was a woodcutter, member of an ancient but decayed family. In 1819 his birthplace having been demolished as a nest of robbers, Antonelli came to Rome, and entered the Grand Seminary, where he proved himself one of the cleverest students of his time. He gained the favour of Pope Gregory XVI., who named him a *prelato*, and gave him some excellent ecclesiastical appointments. In 1841 Antonelli became under-secretary of state to the ministry of the interior; in 1844, second treasurer; and in the following year, finance minister of the two apostolic chambers. Pope Pius IX., having mounted the papal throne in 1846, raised Antonelli, during the next year, to the dignity of cardinal-deacon of Santa Agatha alla Suburra. In 1848 Antonelli was president and minister of foreign affairs in a liberal cabinet, which framed the famous *Statuto* or Constitution proclaimed in 1848, the principal articles of which were so very soon eluded. He accompanied the pope in his flight to Gaeta, and returned with him to Rome, and supported the reactionary policy. In 1855 an attempt was made upon his life. In the Vatican Council of 1869-70, Antonelli showed great tact and ability. He obstinately resisted all concessions to the growing national spirit of the Italian people; but his protestations against the progress of events in Italy were of no avail, and Victor-Emmanuel entered Rome in 1871. At the date of his death, 6th November 1876, the various posts held by Antonelli made him virtually prime-minister to the pope (see PIUS IX.). The great property bequeathed by him to his three brothers was vainly disputed by the Countess Lambetini, claiming to be his daughter, in a tedious and famous lawsuit (1877-79).

Antonello OF MESSINA, an Italian painter, born about 1414, who introduced into Italy the Flemish methods of oil-painting, which he had learned from the Van Eycks. He settled about 1473 in Venice, where he gained great renown as a portrait-painter, and died probably in 1493. His chief extant works are a Crucifixion at Antwerp, and a portrait in the Louvre, both of 1475, another portrait in Berlin, of 1478, and a St Sebastian at Dresden.

Antoninus, M. AURELIUS. See AURELIUS.

Antoninus, ITINERARY OF. See ITINERARY.

Antoninus Pius, TITUS AURELIUS FULVUS, Roman emperor (138-161 A.D.), was born in the reign of Domitian, in the year 86 A.D. His family came originally from Nemausus, now Nîmes, in Gaul. Antoninus inherited great wealth, and early gave proof of excellent qualities. In 120 he was made consul; afterwards he was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. In 138 he was adopted by the Emperor Hadrian, in consequence of his merit alone, and came to the throne in the same year. His reign was proverbially peaceful and happy. In his private character he was simple, temperate, and benevolent; while in public affairs he acted as the father of his people. The persecution of Christians, which was continued

during his reign, was partly stayed by his mild measures, and Justin Martyr's *Apologia* was received by him with favour. Under Antoninus the empire was little engaged in war, except in Britain, where the power of Rome was extended, and a wall built between the Forth and the Clyde against invasion from the north. 'Happy the nation which has no history.' The reign of Antoninus illustrates this saying, for by his justice, wisdom, kindness, and courtesy his vast empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the record of which forms the bulk of the history of the dark centuries of the Roman empire. It is said that only one senator was impeached during the entire reign. Literature received great encouragement; the laws were improved; commerce extended; the means of communication were facilitated by the repair of roads and bridges; new sanitary regulations were introduced; and a taste for architecture fostered in the citizens. The epithet *Pius* was conferred on him on account of his conduct in defending the memory of his predecessor Hadrian against certain dishonouring measures brought forward by the senate. Antoninus died in 161 A.D. By his wife Faustina, whom he loved in spite of her unworthiness, he had four children, three of whom died, but one lived to be the wife of Marcus Aurelius, his adopted son and successor.

The Wall of Antoninus is a Roman rampart erected between the Firths of Forth and Clyde, in 140-142 A.D., during the reign of Antoninus Pius, to restrain the encroachments of the northern tribes; the superintendence of the work is credited to the imperial legate, Q. Lollius Urbicus. Following the earlier line of Agricola's forts (81 A.D.), it extended some 30 or 40 miles; the eastern termination being at Bridgeness in Carriden (in Gildas, *Caer Eden*), on the Forth, while the western has generally been held to be at or near Old Kilpatrick, and there Dr Macdonald discovered the actual terminus. It was formerly held by some that the wall extended right up to Dumbarton Rock (*Alcluth*). The work consisted of a ditch about 20 feet deep and 40 wide, a rampart of sods on a foundation of stones, about 20 feet high and 15 feet thick at the base, and on the south side a paved military road, with a chain of forts. The most perfect fragments of the *vallum*, popularly known as *Graham's* or *Grime's Dyke*, are perhaps those near Castlecary; within the park of Callendar; and on a slope near Polmont railway station. Extensive and important excavations have been made since 1900 at various parts of the wall, including the fortified stations at Camelon and Roughcastle near Falkirk, at Castlecary, and at Barr Hill near Croy, where the foundations of one of Agricola's forts were discovered underneath the remains of the Antonine fort. There are several Graham's or Grime's Dykes in the Northumbrian borders—*Gryme* or *Grim* being 'giant,' or popularly 'the devil'; and there is a Gryme's Dyke ('ditch' or 'embankment') in Oxfordshire. See 'The Antonine Wall Report' of the Glasgow Archaeological Society (1900); the *Proceedings* of the Scottish Society of Antiquaries; G. Macdonald, *The Roman Wall in Scotland* (1912); G. Macdonald in *Jnl. of Roman Studies*, xi. pt. i. (1921).—For the emperor, see Lacour-Gayet, *Antonin le Pieux* (1888); E. C. Bryant, *The Reign of Antoninus Pius* (1894). The Pillar of Antoninus at Rome was raised in honour of Marcus Aurelius, after his victory over the Marcomanni. On coins and inscriptions the emperor Caracalla (q.v.) was called (like Aurelius, q.v.) M. Aurelius Antoninus.

Antonius, MARCUS (in English more familiar as MARK ANTONY), the great Roman triumvir, who was born about 83 B.C., belonged to

one of the oldest patrician families, and on his mother's side was related to Julius Cæsar. His youth was wasted in dissipation, and finding himself pressed by creditors, he escaped to Greece in 58 B.C., where, for a while, he listened to the Athenian philosophers and orators. His studies here were soon interrupted by the proconsul Gabinius, who appointed him commander of his cavalry. In the campaign against Aristobulus in Palestine, and in Egypt, Antony distinguished himself by his courage and activity, and ingratiated himself with the soldiery. After assisting Cæsar in Gaul, he went to Rome in 50 B.C., to uphold his great kinsman against the oligarchical party, and was appointed *quæstor*, *augur*, and *tribune of the plebs*. Next year, as one of Cæsar's adherents, he was expelled from the *curia*, and fled to Cæsar, who made this a pretext for his war against Pompey. At its outbreak, Antony received the appointment of commander-in-chief in Italy; in the battle of Pharsalia, he led the left wing of Cæsar's army. In 47 B.C. he was made master of the horse by Cæsar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself. He drank; he divorced his wife, and took up with an actress, Cytheris. In 44 B.C. he was made consul, and vainly endeavoured to prevail on the Romans to recognise Cæsar as emperor. On Cæsar's assassination, he played the part so finely described by Shakespeare; and by his funeral oration, with the well-timed display of Cæsar's bloody robe, so wrought on the passions of the people, that the conspirators were forced to escape from Rome, leaving Antony in possession of almost absolute power. Next, we find him occupied in disputes and reconciliations with Octavian (see AUGUSTUS), besieging Mutina, and denounced by Cicero as an enemy of the state. The defeat of Mutina (43 B.C.) drove him a fugitive beyond the Alps; but in Gaul he visited the camp of Lepidus, and gained the favour of the army, of which he took the command. Plancus and Pollio joined him with their troops; and Antony, who so recently had escaped as a helpless fugitive from Italy, returned to Rome at the head of seventeen legions and 10,000 cavalry. Octavian, who had pretended to maintain republican principles, now threw off the mask, and held a consultation with Antony and Lepidus, near Bononia, when it was determined that these triumvirs should share the whole Roman world among themselves. To secure their spoil, they returned to Rome, and began their course of proscription and plunder. Among their first victims was Cicero, the orator whose eloquence they dreaded; and, in all, not less than 300 senators and 2000 *equites* are believed to have fallen. After securing Italy for themselves, and raising an enormous sum of money to carry on the war abroad, Antony and Octavian led their troops into Macedonia, and defeated Brutus and Cassius. Antony next paid a visit to Athens, and then passed over to Asia, to arrange his dispute with Cleopatra, queen of Egypt, whose conduct had offended the triumvirs. The queen herself appeared to answer his challenge, and captivated him by her beauty and address. The conqueror of Brutus and Cassius was made a prisoner, though not a prisoner of war. He followed Cleopatra into Egypt, and lived with her in idleness and luxury, until he was aroused by tidings of a quarrel in Italy between his own kindred and Octavian. This dispute gave rise to a short war, which came to an end before Antony arrived in Italy. A new division of the Roman world was now arranged, Antony taking the East, and Octavian the West, while Lepidus had to put up with Africa. Antony had confirmed his friendship with Octavian by a marriage with his sister, Octavia; but, returning now to

Cleopatra, he resumed his voluptuous mode of life, and was guilty of acts of the grossest injustice. Octavian used these facts to excite the indignation of the Roman people against Antony, and war between the rivals became inevitable. Antony, in his idleness, tried to postpone the coming conflict, and filled the island of Samos (where his troops were quartered) with musicians, jugglers, and buffoons. Meanwhile, at Rome, he was deposed from the triumvirate, and war was proclaimed against Cleopatra. Each party collected its forces, and in the naval engagement of Actium (31 B.C.) Antony was defeated. His hope of finding troops still faithful to him in Libya was disappointed; and he returned to Egypt, there, with Cleopatra, once more to forget his political cares and vexations, until his amusements were suddenly interrupted by the arrival of Octavian at Alexandria. Deserted by the Egyptian fleet, as by his own army, and deceived by a false report of Cleopatra's suicide, he killed himself by falling upon his sword, in the year 30 B.C.

Antony, ST, surnamed THE GREAT, or ANTONY OF THEBES, the father of monachism, was born about the year 251 A.D., at Koma, near Heraklea, in Upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having sold his possessions, and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic Church, and made him the model of monastic life. When 30 years of age, he penetrated farther into the desert, and took up his abode in an old ruin on the top of a hill, where he spent twenty years in the most rigorous seclusion; but, in 305 he was persuaded to leave this retreat by the prayers of numerous anchorites, who wished to live under his direction. He now founded a monastery, at first only a group of separate and scattered cells near Memphis and Arsinoë, which, nevertheless, may be considered the origin of cenobite life. After a visit to Alexandria in 311, he returned to his lonely ruin. In 355 the venerable hermit, then over a hundred years old, made a journey to Alexandria to dispute with the Arians; but feeling his end approaching, he retired to his desert home, where he died, 356 A.D. Athanasius wrote his Life. His festival is kept on the 17th January. See MONACHISM, PACHOMIUS.

ST ANTONY'S FIRE was the name given to a pestilential epidemic, also called the *sacred fire*, which in 1089 swept off great numbers, especially in France; it being held that many sufferers had been cured through the intercession of St Antony, especially by prayer before his relics. The disease was commonly supposed to be erysipelas, which usurped the name of St Antony's Fire; but possibly it was a form of Raphania (q.v.), caused by eating ergot of wheat or rye. See works quoted at EPIDEMICS; Hæser's work (Jena, 1867); and Creighton's *History of Epidemics in Britain* (1891).

Antony OF PADUA, ST, was born at Lisbon, August 15, 1195, and on the father's side was related to Godfrey of Bouillon. He was at first an Augustinian monk; but in 1220 he entered the Franciscan order, and became one of its most active propagators. He preached in the south of France and Upper Italy, and died at Padua, June 13, 1231. He was canonised by Gregory IX. in the following year. He himself practised the most severe asceticism, and opposed vigorously the movement for mitigating the severity of the Franciscan rule led by Elias of Cortona. According to legend, he preached to the fishes when men refused to hear him; hence he is the patron of the lower animals, and is often represented as accompanied

by a pig. His monument, a fine work of statuary, is in the church which bears his name at Padua. Devotion to him has recently been greatly extended in France and other countries.

See *The Chronicle of St Antony of Padua*, by Father Coleridge, S.J. (1883); *St Antony of Padua*, by Lepitre (trans. 1902).

Antaignes, EMANUEL DELAUNAY, COMTE D', was born at Villeneuve, Ardèche, in 1755. His *Mémoires sur les États-généraux* (1788) promoted the French Revolution; but in 1789, when he was chosen as a deputy, he defended the privileges of the hereditary aristocracy, ranked himself with those who opposed the union of the three estates, and maintained that the royal veto was an indispensable part of good government. After leaving the Assembly in 1790, he was employed in diplomacy at St Petersburg and Vienna, where he defended the cause of the Bourbons. In 1803 he was employed under Alexander of Russia in an embassy to Dresden, where he wrote against Bonaparte a brochure, *Fragment du XVIII. Livre de Polybe*. He came to England, and acquired great influence with Canning. On July 22, 1812, he was murdered, with his wife, at his residence near London, by an Italian servant. See L. Pingaud, *Un Agent Secret* (1893).

Antrim, a maritime county in the N.E. of Ireland, province of Ulster, stands (since 1891) first among the Irish counties in population, but in size only ninth. Its greatest length is 57 miles; its greatest breadth, 28; its extent of sea-coast, 90; and its area, 1192 sq. m. Of this, rather more than three-fourths is in tillage and pasture; and one per cent. under wood. Off the north coast lie Rathlin Isle and the Skerries; and off the east coast, the Maiden Rocks. The east coast is hilly; and from Larne to Fair Head, parallel mountain-ranges of no great height, and covering a third of the county, stretch SW. into the interior, forming valleys opening seaward, called the Glens of Antrim. The interior slopes towards Lough Neagh. The highest eminences are—Trostan, 1810 feet; and Slievemish, or Slemish, 1782. The principal streams are—the Bann, from Lough Neagh to the Atlantic; the Main, running parallel to the Bann, but in the reverse direction, into Lough Neagh; and the Bush, flowing north into the Atlantic. Many peat-bogs occur in the county. Six-sevenths of the surface consists of igneous rocks (trachyte-porphry and basalt-rock), often alternating with bands of a red clay or *bole*, and overlying cretaceous and jurassic strata, new red sandstone, and metamorphic rocks. The basalt-rocks, or old lava-flows, have frequently a columnar structure. Between Ballycastle and the mouth of the Bann, the basalt assumes very picturesque forms; and the Giants' Causeway (q.v.) is one of the most perfect examples of columnar basalt in the world. Fine salt-mines occur at Duncrue and Carrickfergus; and small coal-fields near Ballycastle and in the interior. Rich beds of iron ore of fine quality have been recently opened in Glenravel, and a large export has been carried on from Cushendall and Carnlough. The soil of Antrim is mostly light, and the chief crop is oats. The land is very much subdivided. Agriculture (including flax-growing), linen, cotton, and coarse woollen manufacture are the staple industries. Principal towns—Belfast, Lisburn, Carrickfergus. Ballymena, Larne, Ballymoney, and Portrush; Antrim, 1 mile from the N.E. corner of Lough Neagh, has a pop. of 2000. County Antrim returns two members; Belfast borough, four. Pop. (1911) 478,603; or, without Belfast, 193,864, of whom half were Presbyterians, one-fifth Catholics, 21·7 per cent. Protestant Episcopalians. The large number of Presbyterians

is due to the fact that the county was extensively colonised from England and Scotland. The original possessors were the O'Neills, who, in 1333, regained the whole country, except Carrickfergus and part of the Glens—held by the Bissets of Glenarm. The forfeiture of Shane O'Neill, in the reign of Elizabeth, terminated the dominion of his race.

Ant-thrush, a general name for long-legged, thrush-like, but often brilliant birds of the Passerine family Pittidae, chiefly natives of Oriental and Australian regions. They usually frequent thick jungle and scrub, and keep for the most part to the ground, hopping very quickly, and searching for molluscs, insects, and worms among the fallen leaves. Somewhat similar in habit are the shy 'Ant-birds' of South America, the Formicariidae, which are said to feed not on ants, but on the insects which the foraging ants disturb.

Antwerp (Fr. *Anvers*; Flem. *Antwerpen*, 'on the wharf'), the capital of the province which bears its name, the chief commercial city of Belgium, and one of the greatest seaports in the world, is situated on the river Scheldt, 52 miles from the sea, and 27 N. of Brussels. The tonnage of vessels entering the port of the 'Liverpool of the Continent' increased from 240,000 in 1850 to over 14,000,000 tons in 1913, when 7056 vessels entered the port, not counting 44,000 (of over 3,500,000 tons capacity) which arrived by canal from the interior of Belgium, Holland, Germany, and France. The port becoming congested through rapid growth of traffic, a great extension scheme was sanctioned in 1906, and modified in 1913. By 1914 two new basins were completed, with over 6000 yards of quays. Among other improvements provided for are rectification of the river-bed, construction of new river quays, besides a large canal basin and four subsidiary basins. Antwerp has regular passenger services with Harwich (daily), New York (weekly), and other ports. The imports include all the products in common use amongst an industrial and commercial community. The chief exports are flax, sugar, iron, woollen goods, metals, glass, and tallow. The manufactures consist chiefly of sugar, white-lead, cotton goods, lace, linen-thread, sewing-silk, black silk stuffs, starch, petroleum, and printers' ink. There are also tobacco manufacture, the cutting of diamonds and other precious stones, and ship-building. The chief public institutions are the Academy of Sciences, the Royal Academy of Fine Arts, the Colonial University (1923), Naval Arsenal, Museum of Fine Arts (rich in Flemish masters), Zoological Gardens, the Flemish theatres, and the Plantin Museum (1876), and excellently preserved 16th century printing-house. The six-aisled cathedral (1352-1518), the noblest Gothic structure in Belgium, is 384 feet in length by 250 in breadth, with a roof supported by 125 pillars, and an exquisite spire, 403 feet high, in which hangs a splendid carillon of 99 bells. The interior is enriched by three masterpieces of Rubens, including the *Elevation of and the Descent from the Cross*. In the image-breaking riot of 1566 by the populace of Antwerp, the cathedral and its art treasures suffered severely. A beautiful wrought-iron canopy by Matsys covers a well outside. The cathedral and old quarters of Antwerp adjoin the square called *Place Verte*. The Church of St James contains the tombs of the Rubens family. Other noteworthy churches are St Paul's, St Andrew's, St Augustine's, and St Charles Borromeo's. The Exchange (1531), a fine building, is said to have been Gresham's model of the old London Exchange. It was burnt in 1858, but rebuilt in the same style (1872). The *hôtel-de-ville* (1565), on the Grand' Place, is a fine building in Renaissance style. The

Grand' Place contains the Brabo Fountain by Jef Lambeaux. Near the handsome Central Station are found the fashionable shopping avenues. The old fortifications were demolished in 1860, though Alva's famous citadel (1567) stood till 1874. Antwerp, one of the most strongly fortified places in Europe, could not withstand the German guns in 1914, and was occupied 9th October. The Steen Museum comprises remains of the citadel. Pop. (1846) 88,487; (1873) 126,663; (1900) 285,600; (1910, with suburbs) 400,000.

Antwerp is mentioned as early as the 8th century; in the 12th and 13th it gave signs of considerable prosperity, and in the beginning of the 16th century it was the commercial capital of the world. Its

Antwerp Cathedral.

government was free, and its people prosperous and well educated. In 1576 ('the Spanish Fury') it was seized by the Spanish soldiery; 8000 citizens, it is said, were murdered; and the city-hall and nearly a thousand fine buildings were burnt. This catastrophe and the assault of the Duke of Parma in 1585 caused Antwerp to sink into decay, and its population was scattered. From 1794 till 1814, while it was held by the French, Napoleon attempted to make it a great military and commercial centre. The union of Belgium with Holland in 1815 brought prosperity to Antwerp. By the revolution of August 1830 it was linked to the destiny of Belgium. The Dutch commandant, General Chassé, held the citadel, and bombarded the arsenal and city. In 1832 a French army reduced the citadel to ruins, and General Chassé capitulated. The city was handed over to the Belgians, and since the Peace of 1839 and the abolition in 1863 of the Scheldt shipping dues, Antwerp has had a singularly prosperous career. On the German advance in 1914 the government took refuge there. Associated with Antwerp are

the painters Matsys, Rubens, Vandyck, Teniers, Van Brée, and Jordaens, with Conscience the novelist and Van Meteren, historian; statues have been erected to most of these, to Leopold I., Van Ryswyck, and others. French is the business language, but the majority of the people speak Flemish.

Anubis, the son of Osiris (q.v.) in the mythology of Egypt (q.v.), a jackal-headed deity.

Anupshahr, a town of India, in the British district of Bulandshahr, United Provinces, on the right bank of the Ganges, formerly important for thorough trade across the river; pop. 6400.

Anu'ra. See AMPHIBIA.

Anuradhapura, or ANURADHA, a town of 5000 inhabitants in Ceylon, 80 miles N. of Kandy. It was for twelve centuries—from the 5th century B.C. onwards—the capital of the island, and the vast ruins of the ancient city have been only partly excavated or examined. The great tank or dam built for its water-supply in 460 A.D. was restored to use in 1888 (see CEYLON). Here stands what is left of the famous Bo-tree (q.v.) of Gautama.

Anus, the term applied by anatomists to the lower, or (in the case of animals) the posterior aperture of the intestinal canal; the rectum terminating externally in the anus. With regard to its anatomy, it is sufficient to state that it is kept firmly closed on ordinary occasions by the *external* and *internal sphincter* muscles, the former of which contracts the integument around the opening, and, by its attachment to the coccyx behind, and to a tendinous centre in front, helps the *levator ani* muscle in supporting the aperture during the expulsive efforts that are made in the passage of the feces or intestinal evacuations; while the latter, or *internal sphincter*, is an aggregation of the circular muscular fibres of the lowest part of the rectum, and acts in contracting the extremity of the tube. The main function of the *levator ani* muscle is expressed in its name, it being the antagonist of the diaphragm and other muscles which act in the expulsion of the feces. The integument around the anus lies in radiating plaits, which allow of its stretching without pain during the passage of the feces; and the margin is provided with a number of sebaceous glands, which, in some of the lower animals, secrete strongly odorous matters (see ANAL GLANDS).

Infants are occasionally born with an *imperforate anus*, or congenital closure of the rectum. In the simplest and most common form of this affection, the anus is merely closed by thin skin, which soon becomes distended with the Meconium (q.v.), and can easily be divided. Cases where the obstruction is at a higher point are more serious; but even these can generally be relieved by a surgical operation. When this is neglected or is unsuccessful, death speedily takes place, with symptoms resembling those of intestinal obstruction from any other cause. *Spasm of the sphincter ani* is characterised by violent pain of the anus, with difficulty in passing the feces. It is almost always caused by the presence of an ulcer or fissure, or by some morbid condition in neighbouring parts. *Ulceration* occurring as a breach of surface at one or more points around the anus, but not extending within the orifice, is sometimes met with; but more common and important is *fissure of the anus*, a term applied to a crack, or superficial ulceration, situated between the folds of the skin and mucous membrane at the verge of the anus, and extending within the rectum. It gives rise to intense pain during the passage of the evacuations, and for some hours afterwards to great discomfort, smarting, and itching. The treatment to be adopted is to endeavour to procure

regular and somewhat soft evacuations, and to sponge with warm water immediately afterwards, the parts being dried with a soft cloth. In slight and recent cases, one or two applications of solid nitrate of silver, with the use of a mild astringent lotion, will sometimes cure the disease. Where the pain is severe, division of the base of the fissure by the knife, or by stretching, is usually necessary. *Pruritus ani*, which simply means intense itching and irritation of this part, is usually a symptom of morbid changes rather than a special disorder; but sometimes occurs alone, and is often a very distressing and obstinate affection. It is often associated with an unhealthy state of the intestinal secretions, or with simple constipation; with a congested state of the mucous membrane; with a disordered condition of the womb; with the presence of thread-worms in the rectum, &c.; and it is peculiarly common in persons whose occupations are sedentary. The affection is often much aggravated by the patient's being unable to refrain from scratching the parts, which leads to excoriations, ulcerations, thickening of the skin, &c. Treatment must of course first be directed to these associated conditions, when present; and with their removal the irritation often disappears. A lotion containing carbolic acid, hydrocyanic acid or cocaine, or zinc ointment, or a suppository of zinc oxide and cocoa butter in equal parts, often gives relief. To prevent the reappearance of ulcerations, &c., a strong alum lotion should be used to bathe the part night and morning. The other principal affections of the anus are *Fistula*, *Piles*, and *Prolapsus*, which are discussed in special articles.

Anville. See D'ANVILLE.

Anwari, a celebrated Persian poet who flourished during the 12th century, was born in Khorassan, and became a favourite of the Seljukide sultan, Sanjar. His poems consist chiefly of lengthy panegyrics and shorter lyrical effusions. The latter (*ghazels*) are characterised by simplicity, ease, and naturalness; but the *kasidas*, long poems mainly in praise of his patron, are disfigured by extravagant imagery and abound in keen sarcasm. Anwari was also a notable astrologer.

Anzin, a great metal-working town and coal-mining centre in the dept. of Nord, forming a north-western suburb of Valenciennes.

Aonlaganj, or AONLA, a decayed town of India, in the British district of Bareilly, once the capital of Rohilkhand; pop. 13,000.

Aorist (Gr. *aoristos*, 'unlimited'), a form of the Greek verb by which an action is expressed as taking place in an indefinite time. It corresponds in meaning to the simple past tense in English, as 'he died.' The Greek language is especially fertile in the past tenses of verbs, having, in addition to the tenses common to other languages—namely, the imperfect, perfect, and pluperfect—the aorist, which is peculiarly adapted to the narrative style of writing. The distinction of first and second aorist is purely formal. The preterite in Germanic languages seems to be in part derived from the Indo-Germanic aorist.

Aor'ta is the great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The aorta in man is subdivided by anatomists into the arch, the thoracic aorta, and the abdominal aorta. The arch is a loop with the convexity directed upwards, forwards, and to the right side, reaching at its highest part to a level with the upper border of the cartilage of the second rib. Changing its direction, it runs from from right to left, and from before backwards to reach the left side of the spine at the lower border of the fourth dorsal vertebra, where it becomes the thoracic aorta. Five arteries

arise from the arch—viz. two coronaries, for the supply of the muscular tissue of the heart itself; the innominate, dividing into the right common carotid and right subclavian arteries; and the left common carotid and left subclavian arteries.

Diagram of the Aorta, with its principal Branches :

- 4, ascending part of the arch of the aorta; a, thoracic aorta; db, abdominal aorta; c, d, right and left ventricles of heart; e, f, right and left auricles of the heart; g, h, right and left pulmonary arteries; i, k, right and left common carotid arteries; l, m, right and left subclavian arteries; n, hepatic artery; o, gastric artery; p, splenic artery; q, r, right and left renal arteries; s, t, superior and inferior mesenteric arteries; u, v, right and left common iliac arteries; w, middle sacral artery; x, phrenic arteries; y, spermatic arteries.
- 1, superior vena cava; 2, right internal jugular vein; 3, right subclavian vein (the left is removed to show the arch of the aorta); 4, inferior vena cava; 5, 6, right and left pulmonary veins; 7, hepatic veins; 8, 9, right and left renal veins; 10, 11, right and left iliac veins; 12, trachea.

At the commencement of the aorta there are three small swellings or pouches, the aortic sinuses, internal to which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood into the heart. The thoracic aorta extends from the lower border of the fourth dorsal vertebra to the diaphragm, gradually reaching the middle line of the spine. The thoracic aorta gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (usually nine on each side, the upper two intercostal spaces being supplied by a branch from the subclavian artery). The abdominal aorta passes from the diaphragm to the fourth lumbar vertebra, opposite the body of which it divides into the two common iliac trunks. The abdominal aorta gives off: (a) Branches to the abdominal viscera. These are either single or in pairs. The single arteries are—the celiac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric, for the small, and part of the large intestine; the inferior mesenteric, for the large intestine not supplied by the superior mesenteric. The paired arteries are the supra-renal, renal, and spermatic or ovarian. (b) Branches to the abdominal walls—viz. the two phrenic arteries to the diaphragm; the lumbar arteries, four pairs, for the

supply of the lower part of the abdominal wall (the loins); the middle sacral or caudal artery, a small vessel which arises from the back of the aorta just above its point of bifurcation. In fish and animals with tails, this branch is the caudal prolongation of the aorta.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. The structure of the aorta will be given under ARTERIES; and the comparative anatomy under CIRCULATION.

During foetal life, there is a communication between the arch of the aorta and the pulmonary artery, called the *ductus arteriosus*, the canal of which becomes obliterated after birth. In the human carotid artery, it has been calculated that the blood-stream moves with a velocity of 10½ inches per second, and that the pressure of blood in the same vessel would support a weight of 3 lb. 2 oz. to the square inch.

The coats of the aorta are very subject to fatty disease termed *Atheroma* (q.v.), and in advanced life, to calcareous degeneration or deposit of lime-salts, which destroys their elasticity. This change renders them very liable to *Aneurism* (q.v.), which, as may be expected, is generally situated at the curves of the aorta, especially at the arch, where the force of the blood-stream is greatest.

Aosta, a cathedral city of Italy, on the Dora Baltea, at the junction of the roads crossing the Little and the Great St Bernard Passes, and 80 miles NNW. of Turin by rail. It is surrounded by orchards, vineyards, and almond plantations, and stands 1900 feet above sea-level. The ancient *Augusta Prætoria Salassorum* (founded 25 B.C.), Aosta has many Roman remains, including town walls, the Porta Prætoria, Arch of Augustus, &c. St Benaud was archdeacon of Aosta; and here Anselm, Archbishop of Canterbury, was born. Population, 8000. The beautiful valley of Aosta, between the Graian and Pennine Alps, is rich in woods, pastures, minerals, and hot mineral springs (including Courmayeur and Pré St Didier). The natives speak a French patois. Cretinism prevails to a lamentable extent. The Duke of Aosta is a royal prince of the house of Savoy.

Apaches, a tribe of North American Indians, of the Athabaskan family, formerly living in southern Arizona and New Mexico. Fierce and war-like, they were long the scourge of the frontier regions of the United States and Mexico, the difficult character of their country and their remarkable hardihood and daring rendering it a severe task to subdue them. This was not completely accomplished until 1886. They were then placed on a reservation in Arizona, a band of special savagery being sent farther north and held as prisoners. Some of them proved efficient workers at the Roosevelt irrigation dam in Arizona. The name is applied to desperadoes in Paris.

Apalachicola. See APPALACHICOLA.

Apatin', a town of Yugoslavia (till 1920 Hungary), on the left bank of the Danube, 49 miles SW. of Theresopol. It manufactures woollen cloth, and trades in hemp, silk, madder, and woad, the products of the vicinity. Pop. 15,000.

Apatite (Gr. *apatē*, 'deception'), a mineral, consisting chiefly of phosphate of lime, so named because it resembles various other minerals for which it might be mistaken. The different varieties of apatite contain a little fluoride or chloride of calcium, or both, as well as phosphate of lime. The contained phosphoric acid is doubtless due to the accumulation of excrementitious or other animal deposits along shores or in pools during Tertiary times. It occurs both massive and in crystals, which are generally small, and are often

six-sided prisms, or six-sided tables, but some very large ones have been brought from Canada. It occurs in some of the tin-mines in Cornwall, Saxony, Bohemia, &c., and in rocks of various ages. It is found of various colours, more or less green, blue, or red, sometimes white, and often gray. It frequently occurs, generally in the form of small needles, as a rock-constituent, in such rocks as granite, dolerite, diorite, &c. The massive radiated variety of apatite is called *phosphorite*; and when massive, earthy, and impure, it is known as *osteolite*. These massive varieties may occur in veins, beds, or irregular masses, and are perhaps most abundantly met with amongst the archæan rocks. In Spain they occur in cretaceous strata. These mineral phosphates of lime are much used in the preparation of manures, on account of the contained phosphoric acid. The commercial supplies come mainly from Norway, Canada, parts of the United States (Carolina, Florida, Tennessee), and Algiers. Coprolites are phosphatic nodules. Commercially, any natural lime-phosphate is known as apatite. Hence phosphatic nodules, and the interesting 'rock-guano,' called *osite* or *Sombrierite*, are alike spoken of as apatite. *Sombrierite* has been obtained in large quantities from the small island of Sombro, to the east of the Virgin Islands, in the British West Indies. It is now believed that this hard or rock guano has been formed by water filtering through ordinary guano into the coral rock adjoining, and turning it more or less completely into phosphate of lime. The general treatment to which mineral phosphate is subjected is to reduce it to powder, and act upon the pulverised matter with sulphuric acid, which renders the phosphoric acid in the apatite soluble in water. See MANURE, LIME, PHOSPHORUS.

Ape, a term variously used for the anthropoid apes, for the tailless or the short-tailed apes, and for monkeys generally; or specifically for the majority of monkeys, with the exception of the anthropoids on the one hand, and the lemurs, or semi-apes, on the other. Thus defined, the apes include (a) the *Arctopithecini*, or marmosets, small furry South-American forms like squirrels—e.g. *Hapale* and *Midas*; (b) the *Platyrrhini*, or broad-nosed New-World apes, almost always quadrupedal, without cheek-pouches or callosities on the hips—e.g. *Myceetes* or howling-monkey, *Cebus* or Capuchin, *Ateles* or spider-monkey, *Pithecia*, *Chrysotrix* or squirrel-monkey, and *Nyctipithecus*; (c) the majority of the *Catarrhini*, or Old-World monkeys, with a narrower partition between the nostrils, and never with prehensile tail. Only the lower forms, or *Cynomorpha*, are included in this classification, the higher Anthropoids being separated (after Hartmann) to form along with man the higher family *Primarii*. The *Cynomorpha* (dog-like) include Baboons (*Cynocephalus*), Mandrills (*Papio*), Macacus, the Barbary Ape (*Inuus*), *Cercopithecus*, Colobus, the Sacred Monkey (*Semnopithecus*), &c. See MONKEYS, ANTHROPOID APES.

Apeldoorn, a flourishing town of the Netherlands, in the province of Gelderland, 17 miles N. of Arnheim. The Loo, a royal hunting-lodge, beloved of William of Orange, is in the neighbourhood. There are no less than forty paper-mills in Apeldoorn, most of the paper manufactured being sent to the East Indies. Other industries are agriculture, grinding corn, copper-founding, and manufacturing blankets and coarse woollen cloth. Pop. 50,000.

Apelles, the most celebrated painter in ancient times, was the son of Pytheas, and was probably born at Colophon, on the Ionian coast of Asia Minor. He flourished in the latter part of the 4th century B.C., received his first instruction in art

under Ephorus in the Ionian school of Ephesus, and afterwards at Sicyon, and thus he united the fine colouring of the Ionian with the accurate drawing of the Sicyonic school. During the time of Philip, he visited Macedon, where he became the intimate friend of Alexander the Great. Pliny relates that on one occasion when Alexander visited Apelles in his studio, the king exhibited such ignorance of art, that the artist recommended him to be silent, as the boys who were grinding the colours were laughing at him. He is said to have accompanied Alexander on his expedition to Asia, and to have settled at Ephesus. The most celebrated paintings of Apelles were his *Anadyomene*, or *Aphrodite* rising from the Sea, and the *Graces*, and others on similar subjects. His portrait of Alexander wielding a thunderbolt was very famous. Apelles willingly acknowledged the merits of his contemporaries. When his pictures were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is said that Apelles instantly rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place, and told the cobbler to stick to his last; or, in the Latin version, which has become proverbial, 'Ne sutor supra crepidam (judicaret).' All that we know of his art is derived from late Greek and Roman authors; but he seems to have combined many of the excellences of his predecessors. He did not belong to the noblest period of art, and seems to have been more remarkable for skilful effects and elaborate finish than for originality.

Apennines (Ital. *Appennini*, Lat. *Mons Apenninus*; from Celtic *pen*, 'a head' or 'mountain-height'), a mountain-chain extending 740 miles uninterruptedly throughout the whole length of the Italian peninsula. It belongs to the system of the Alps, from which it branches off near Savona. From this point, the chain, under the name of the Ligurian Apennines, girdles the Gulf of Genoa, in the immediate vicinity of the sea, and then runs inland, forming the watershed between the Adriatic and the Mediterranean, but gradually approaching the east coast, till, in the highlands of the Abruzzi, it is close upon it; after which it takes a southerly direction through Naples, dips under the sea at the Strait of Messina, and reappears on the northern coast of Sicily. The chain is divided by geographers into the *Northern*, the *Central*, the *Southern*, and the *Sicilian Apennines*. The leading feature of the Apennines, wherever they approach the coast, is their extraordinarily steep declivities; while in Middle Italy and the adjoining portions of Upper and Lower Italy, long terraced plateaus, lower ranges, and extensive coast-plains mark their gradual descent on the west. The main chain of the Apennines does not send off spurs into the Apulian peninsula.

The direction of the great chain of the Apennines is favourable to the formation, on the west side, of largish river-basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while on the east side we find nothing but small streams, in most cases destitute of affluents, hurrying down to the sea through wild precipitous valleys.

The average height of the entire chain of the Apennines is about 4000 feet, which, however, in the north, sinks down to little more than 3500 feet; and in the mountains of the Abruzzi, rises to 7000 feet. Here, in Monte Corno, the highest peak of the range known under the name of Gran Sasso d'Italia, they reach an elevation of 9574 feet, and in Monte Velino, of 7916 feet.

The Apennines are crossed by thirteen principal passes, the majority traversed by railways. The

strata are principally of Jurassic, Cretaceous, and Tertiary age. The central ridges, especially in the middle and south, consist largely of Jurassic limestones, &c., Triassic rocks appearing here and there in the axes of the deeper folds. These central folds are flanked on the north-east and south-west by more or less interrupted belts of Cretaceous rocks, which again are overlaid by Pliocene formations. In the north, rocks of Eocene, Oligocene, and Miocene age predominate. The Apennines, especially the Roman and Neapolitan, are notable for rich variety of marbles. Volcanic rocks abound in the middle and southern regions.

The principal chain exhibits, for the most part, a dreary and barren appearance. It looks like a vast wall, with very few projecting peaks to break its dull monotony. Only in the Abruzzi, in the Sub-Apennines, and above all, in the marble mountains of Carrara and Seravezza, do the bold and magnificent forms of the Alps appear. Where water is plentiful there is no lack of rich pastures and dense forests; but usually only thin grass and wild scrubby bushes cover the stony slopes. The greater number of the forest brooks, with deep rocky ravines, display, during summer, only a dry bed. Where the mountains dip down to the sea, as at the Riviera of Genoa and the Gulf of Naples, a rich, peculiarly southern vegetation clothes the declivities. There is no region of perpetual snow; but the summits of the Abruzzi and the lofty peaks of Lunigiana are often covered with snow from October far into May, and send their icy breath so suddenly down into the mild valleys, that the temperature in a few hours sinks 12° or 18° F.

Apenra'de. See AABENRAA.

Apenta, a bitter alkaline spring at Budapest.

Apera, a genus of grasses, of two species, natives of Europe (including England) and W. Asia. The handsome, silky bent-grass (*A. Spica-Venti*) grows in sandy fields.

Aperients are substances which are employed to cause intestinal evacuations. Many articles of food, such as oatmeal, brown bread, and bran biscuits, and fruits such as figs, prunes, and strawberries, are used for this purpose; but the term is usually applied to denote certain medicines which act upon the intestines and cause them to expel their contents. Although considerable progress has been made in recent years in the investigation of the action of various drugs upon the intestines, we are as yet unable to give a final classification to them. For practical purposes, however, we may classify aperients as follows: (1) laxatives and (2) purgatives—(a) cathartic and (b) drastic. (1) Laxatives are substances which only slightly increase intestinal action. They act without causing any irritation or griping. The chief examples of this class are manna, magnesia, liquid paraffin, olive oil, sulphur, and castor oil in small doses. (2) Purgatives—(a) Cathartics are substances which quicken or increase the evacuations from the intestines, and in their action may cause griping. Examples of this class are aloes, castor oil in large doses, rhubarb, and senna; (b) drastics are substances which are prompt, powerful, and effective in operation. Colocynth, croton oil, elaterium, gamboge, jalap, podophyllin, and scammony belong to this class. Besides the substances already enumerated, we must mention the saline aperients—e.g. sulphates of potassium, sodium, and magnesium, tartrates of potassium and sodium, phosphate of sodium, and citrate of magnesium. Of the above drugs, bitartrate of potassium, elaterium, and gamboge act as hydragogues (Gr. *haidōr*, 'water,' and *agō*, 'I drive away'), as they tend to remove water from the system; and aloes, euonymin, iridin, mercurial preparations (blue

pill, calomel), podophyllin, and rhubarb, act as cholagogues (Gr. *cholē*, 'bile'), as they increase the evacuation of bile. Purgatives may be said to act in three ways—(1) by increasing the peristaltic action of the intestines; (2) by causing an increase of the secretion from the intestinal mucous membrane; and (3) by preventing the absorption of the fluids of the intestines. Purgatives have various uses, for they not only remove the contents of the intestines, but also prevent the accumulation of feces in them, and the irritation such accumulation causes. They are useful in cases of dropsy, to remove excessive fluids from the body. In fever they lower the temperature, and they are of use in lowering the blood pressure in certain diseases. Lastly, in cases of hernia, aneurism, and some other disorders, they are beneficial in preventing difficulty in the act of defæcation. Although the use of aperients is of undoubted benefit, yet their abuse is much to be deprecated, as to employ them habitually or promiscuously may produce serious results. There are also used as aperients many Mineral Waters (q.v.).

Apet'alous ('without petals'), a term applied somewhat indefinitely to those flowering plants in which the petals are absent. It represented a distinct subdivision in A. de Jussieu's classification, *Apetalæ*—broadly corresponding to *Monochlamydeæ* of later authors, but is more convenient as a merely descriptive term, since the absence of petals occurs not only in entire groups, like the catkin-bearing Amentaceæ, but in degenerate forms in many unrelated orders. When both calyx and corolla are absent, the term *achlamydeous* (Gr. *chlamys*, 'a covering') is often used.

Aphasia is the term originally introduced by Trousseau to denote the inability to express thought by means of speech which follows certain diseases of the brain; in recent years, however, it has obtained a wider significance, and may now be defined as the loss of the faculty of interchanging thought, without any affection of the intellect or will. The interchange of thought involves, in the first place, the expression of mental processes by means of conventional symbols, and, in the second place, the comprehension of these symbols. Language, in its widest sense, includes all the methods by which thought may be communicated, and makes use of three classes of symbols—gestures, speech, and writing. The interchange of thought may be interrupted by derangement (1) of the expression of mental processes by their corresponding symbols, or (2) of the comprehension of the meaning of these symbols. In other words, there may, on the one hand, be an interference with the channels through which thought is translated into symbols; and, on the other hand, there may be a derangement of the channels by means of which symbols are interpreted as thought. In the former case, the change affects the mechanism conducting from the mental idea to the symbol, which is often termed the motor symbol process; in the latter, there is an alteration in the mechanism conducting impulses from the symbol to the mental idea, often called the sensory symbol process. There is therefore a motor and a sensory aphasia, and either of these may affect one or more of the three classes of symbols mentioned above.

In *motor aphasia*, there is a loss of the memory of the co-ordinated movements necessary for the formation of symbols, and this usually includes gestures, speech, and writing. The inability to write is commonly termed *agraphia*. The patient is unable to originate the name of any object shown to him, although he evidently knows what it

is, and he cannot reply to any question although he clearly understands it. Sometimes when he is shown an object and asked if it bears a name mentioned, he may be able to show acquiescence or dissent by means of gestures, but usually even this power is absent.

In *sensory aphasia*, there is loss of the memory of the meaning of symbols. This may affect the recollection of spoken language. The patient can hear every sound, but cannot understand a single spoken word. He can speak himself with more or less fluency, but without understanding his own words, or detecting any errors he may make, and in speaking he usually commits many mistakes; he can also read printed and written language, and he can write himself. This condition is termed word-deafness. Sensory aphasia may also be due to a loss of the recollection of written, printed, or gesture language. The sight is sufficiently good to enable the patient to distinguish objects clearly in most cases (although the extent of the field of vision is often somewhat diminished), and he can name these objects quite correctly. He is able to converse perfectly, and to write either his own thoughts or to dictation, but he cannot read what he has written, or detect any mistakes in it. He can slavishly copy printed and written words, as if he were drawing, without understanding their meaning, and he copies all mistakes. This is what is known as word-blindness.

It must not be forgotten that aphasia is entirely independent of any affection of the intellect. It must further be carefully distinguished from mere loss of speech caused by difficulty in articulation due to paralysis. This condition is commonly known as *aphemia*.

Turning to the localisation of the diseases which cause the different varieties of aphasia, we find that our knowledge has recently been much extended, not only by the careful observation of clinical and pathological facts, but also by the results of experimental investigation. These two methods of inquiry are both of great use in checking their several facts. While the individual muscular acts required in the motor symbol process are ruled by centres in the spinal cord and medulla oblongata, the seat of the memory of their co-ordinated movements is in the brain. It may be well to mention here that the nerve-impulses cross from one side of the body to the other in their course from centre to periphery, and *vice versa*. While the majority of mankind therefore are right-handed, they are also left-brained. This greater use of the left half of the brain applies to the communication of ideas in every way. No doubt the right side takes up the work of the left, after a time, in the case of any lesion, and this is more especially the case when the affection has come on in early life. In the lower part of the frontal lobe of the brain are situated the centres concerned in the co-ordination of the muscular acts in articulation, the exact position being the third or lowest convolution, usually called Broca's convolution in honour of the distinguished man who first pointed out the connection between disease in this spot and aphasia. Any lesion in this region causes motor aphasia, and if both sides of the brain are affected, this will be complete and permanent. A little higher in the frontal lobe are the centres for gesture and for writing. The auditory perception of words has its centre in the highest convolution of the temporo-sphenoidal lobe. Disease of this part of the brain causes word-deafness. The visual perception of words depends on the integrity of the angular gyrus of the parietal lobe, and if this convolution is affected, the symptom described as word-blindness ensues. See BRAIN.

Aphelion, that point in the elliptical orbit of a planet which is most remote from the sun. The opposite point, or that nearest to the sun, is styled the Perihelion. At the former point, the swiftness of the planet's motion is least, and begins to increase; at the latter, it is greatest, and begins to decrease. This irregularity of motion is most remarkable in comets whose orbits deviate most from the circle. The word is a Grecised form of Kepler's Lat. *aphelium*, from Gr. *apo*, 'from,' and *hēlios*, 'sun.' See APSIDES, ORBIT.

Aphemia, a paralytic disease (see APHASIA above), in which words are understood and remembered, but the power to utter them is lost.

Aphides (Gr.), a family of small 'plant-lice' belonging to the order of hemipterous insects. They occur very abundantly in temperate regions as parasites on the roots, leaves, stems, &c. of plants, to which they frequently do great damage. Towards the tropics they seem to be replaced by the families to which the cochineal insects and Cicadas belong. The Rose Aphis, the 'colliers' of the bean-plant, the cottony 'American blight' of apple-trees, and the Phylloxera (q.v.) of vines, are too familiar representatives of the family. The mouth organs are adapted for piercing and sucking plants, and consist of four long sharp stylets within a proboscis or sheath. The posterior end of the body usually bears two projecting honey-tubes, which emit a sweet secretion. Wings may be absent in both males and females, but are usually present in the former, and absent in a section of the latter to be afterwards noted. The legs are long and slender, but not adapted for rapid movement; in fact, the aphides rarely wander far from their birthplace, except during the spring and autumn migratory flights of the females. Many forms migrate at the beginning of summer to another kind of plant, and return in autumn to their original haunt; but others seem to restrict their attentions to one form. The body is often brightly and protectively coloured—very frequently green or brown. They are generally dusted over with a protective mealy substance, and many forms exhibit a silky or cottony coat. The troublesome 'green-fly' may be of various species.

Their presence is readily detected by marks, wrinkles, or abnormalities on the infested plant, and notoriously also by the 'honey-dew' which they secrete. This glutinous sweet substance which covers the leaves of trees, &c., especially during warm weather, is sometimes abundant enough to drop to the ground. It has excited interest from very early times, and has a widespread popular reputation for medicinal virtues. Pliny hesitates whether he ought to regard it as 'the sweat of the heavens, the saliva of the stars, or a liquid produced by the purgation of the air.' It is, however, a by-product, perhaps manufactured within the aphid from the juices of the plant on which it preys, or very probably an excretion, if not even a mere overflow, of surplus undigested glucose. The secretion oozes out from the honey-tubes above referred to, but similar products have also been observed to issue from the anus. Ants and other insects greedily hunt for this luxury, and the former have been seen tickling the aphides to induce secretion. They also tend, protect, and imprison these valuable sources of sweetness, which Linnæus long since expressively called their 'cows' (see ANT). Besides injuring or killing plants by preying upon their juices, the aphides produce abnormal growths and Galls (q.v.). These are often of considerable size, and sometimes exhibit a protective mimicry of fruits. They serve as the homes or cradles of the parasites. The reproductive relations have been for long noted on account of the

prevalence of parthenogenesis, or reproduction without fertilisation. At the end of autumn both male and female forms may be observed; and the fertilised eggs deposited in some safe place are hatched in spring, and give rise to female parthenogenetic forms, which are usually winged, and produce their young alive. Throughout summer there is a constant succession of parthenogenetic, viviparous females, and the number of generations appears to be limited only by temperature and food-supply. The return of autumn, however, means of course lowered temperature and scarcity of food, and these conditions are associated with the production of males. These fertilise the females, which are at this stage wingless, and the winter eggs are then laid. It appears that males may sometimes occur along with the viviparous forms, and that the latter may perhaps occasionally hibernate; but it is nevertheless demonstrable that warm weather and abundant food are conditions which result in the production of parthenogenetic females, while scarcity of food and cold weather cause the reappearance of males, and consequent sexual reproduction. Thus Réaumur succeeded in rearing above fifty parthenogenetic generations, all descended from one mother, by keeping up, for three or four years, an artificial summer. The experiment has been often repeated, and the viviparous parthenogenesis retained for even longer periods. The viviparous females are

Fig. 1.—*Aphis padi*. (After Kessler.)

The figure represents equally well, 1, the autumn forms—the sexual male and the wingless female, the parents of the spring brood; 2, winged and wingless viviparous parthenogenetic forms occurring in spring; and 3, an autumn winged female appearing after a succession of wingless forms.

frequently equipped with wings, which are generally absent in the egg-laying forms. They differ in other respects, but especially in the simplified structure of the reproductive organs, from which the young are developed by a process comparable to internal budding. So, too, the early spring forms, arising from fertilised eggs, resemble their sexual parents, and differ markedly from their parthenogenetic progeny. The eggs of aphides develop into active six-footed larvae, which moult several times (see METAMORPHOSIS), and give rise to six-footed pupæ, which finally become imagoes.

It is quite impossible to give in figures any idea of the prolific increase of these luxurious parasites. Even during its short lifetime an aphid may have a progeny computable only in billions. A score may be born in as many hours, and these become in a few days the founders of new families. From a form producing only one per day, a population of not less than the fifteenth power of 210 would be the result at the end of 300 days, while an even more moderate computation given by Huxley

shows that the tenth brood alone would weigh more than 500 millions of stout men. The increase is continually checked, however, by storms and sudden changes of weather, and also by the voracity of birds and insects. Some insects regularly feed upon aphides, while others deposit their ova in their living bodies (see ICHNEUMON), and thus utilise them as living cradles for their young, which, in such cases, are literally born out of death. Favouring circumstances sometimes lead to the appearance of extraordinary swarms of aphides, which have been noted in local histories as 'darkening the sun,' and have left a more permanent mark in the destruction of certain crops. In this connection the tiny plant-lice are of some economic importance. Apart from the vine insect *Phylloxera* (q.v.), which does so much damage in the vineyards of the Continent and North America, the aphides of turnip, cabbage, potato, bean, apple, pear, larch, &c. have frequently been the cause of widespread loss. The price of hops varies from one year to another very much according to the prevalence of the 'fly.' For the last hundred and fifty years aphides have been unremittingly studied. Their life-history was first precisely investigated by Réaumur and Bonnet, and many of the most noted naturalists have continued their researches. The reader is referred to G. B. Buckton's Ray Society Monograph on British Aphides (4 vols. 1876); and Miss Ormerod's work on *Injurious Insects* ought to be consulted for practical purposes.

Fig. 2.—Owen's figure, showing life-history of *Aphis*:

a, the first spring form developing from fertilised ovum; *e*, the succession of parthenogenetic viviparous forms; *h* and *i*, the reappearance of sexual individuals, male and female, in autumn; *k* and *l*, the appearance of sexual forms at an earlier date.

Aphonia. This term is applied to loss of voice from whatever cause arising. Normally, the production of the voice is due to (1) the tension of the vocal chords, and (2) respiratory effort. Loss of voice may therefore depend upon (1) laryngeal disease or (2) deficient respiratory power. The morbid conditions of the larynx may be either functional—as in hysterical aphonia—or organic, when the lesion is either situated in the larynx, or due to an affection of the laryngeal nerves or nerve centres. See LARYNX. The vocal chords themselves may be more or less destroyed, and yet a certain amount of vocal power remain, because it sometimes happens that the false chords come together, and when they are caused to vibrate by the passage of air, produce a harsh, but distinct voice. Loss of voice may also—as could be inferred from what has just been stated—arise from diseases of the respiratory organs or general weakness. The treatment must of course depend upon the morbid condition which causes loss of voice, and can only be determined in each case after careful examination with the laryngoscope.

Aphorism (Gr.), a principle expressed tersely in a few words, or a short and pithy sentence conveying a general truth; such as, 'Use is second

nature.' A whole work is sometimes written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection. Occasionally impressive, this style is more often wearisome. The name was first used in the *Aphorisms* of Hippocrates.

Aphrodité, one of the chief divinities of the Greeks, the goddess of love and beauty, so called because she was sprung from the foam (*aphros*) of the sea. She was the wife of Hephæstus, but she loved besides, among gods, Ares and Dionysus, and among mortals, Anchises and Adonis. The chief places of her worship in Greece were Cyprus and Cythera. Aphrodite not only surpassed all other goddesses in beauty, but she had the power of granting irresistible beauty and attractiveness to others, especially to wearers of her magic girdle. The sparrow, the dove, and the swan were sacred to her, as also the myrtle, the rose, and the poppy. In the later poets, Eros is her son and her constant companion. Only such sacrifices as flowers and incense were made to Aphrodite. In earlier times the patroness of marriage and maternity, she became later the ideal of graceful womanhood, and was spiritualised by Plato as *Aphrodite Urania*. By others she was degraded in *Aphrodite Pandēmos* to be the patroness of mere sensual love. Mysteries of an impure kind formed part of the ceremonial of the *aphrodisia*, or festivals held in her honour. Aphrodite was probably not originally identical with Astarte, or the Ashtoreth of the Hebrews. The Aphrodite of Cyprus is most probably a goddess of vegetation, and one form of the great goddess of the gifted Ægean people whose 'Minoan' culture lived longest in Cyprus. By the Romans she was identified with Venus, hitherto one of the least important Roman divinities (see VENUS). Aphrodite has had the most important place in the history of art as the Greek ideal of feminine grace and beauty. Her most famous statue in antiquity was that of Praxiteles at Cnidus; her most famous picture, the *Aphrodite Anadyomene* of Apelles. The finest statues of the goddess that still exist are those of Melos (Milo) at Paris, of Capua at Naples, and of the Medici at Florence. For aphrodisiacs, see PHILTRE.

Aphthæ are small whitish ulcers, usually commencing as vesicles, on the surface of a mucous membrane. The whitish substance generally contains large quantities of a minute fungus, *Oidium albicans*. They are painful, and may be extremely so. The most common site of aphthæ is the mucous membrane of the lips and mouth, but they occasionally appear wherever mucous membrane approaches the skin.

Infants are liable to an apthous eruption termed *Thrush* (q.v.). Aphthæ in adults are generally a consequence of fevers and other diseases, or a symptom of disturbance of the digestive system. In some cases of pulmonary consumption, they form a painful addition to the patient's sufferings. In ordinary cases of aphthæ, a preparation of borax, or some antiseptic wash, generally effects a rapid cure. Where the pain is severe, a simple application of solid nitrate of silver is the best remedy.—For Aphthous Fever, see MURRAIN.

Apia. See SAMOA.

Apianus, PETRUS (1501–52), professor of mathematics at Ingolstadt, was an eminent cosmographer; and so was his son Philip, his successor.

Apicius, MARCUS GABIUS, a Roman epicure, of the times of Augustus and Tiberius. It is said that when he had spent £800,000 upon his appetite, and had only some £80,000 left, he poisoned himself in order to avoid the misery of plain diet. Two other gourmands—one a contemporary of

Sulla, the other of Trajan—bore the name Apicius. The Roman cookery-book, *Celii Apicii de Opsonibus et Condimentis, sive de Re Culinaria, Libri decem*, ascribed to Apicius, must belong to a much later time, inasmuch as it abounds in inaccuracies and solecisms. Its author thought proper to recommend his work to gourmands by affixing to it the celebrated name of Apicius.

Apion, a Greek grammarian, was born in the Libyan oasis, but educated in Alexandria, which he affected to consider his birthplace, from a wish to be thought a pure Greek. Settling at Rome about 30 A.D., he became famous as a teacher of rhetoric. He seems to have been as remarkable for his loquacious vanity as for his knowledge and real oratorical power. From his ostentatious disputations Tiberius used to call him *Cymbalum Mundi* ('the cymbal of the universe'). With the exception of one or two fragments, the whole of Apion's numerous writings are lost. These included a work on the text of Homer; a work on Egypt, which contained the far-famed story of 'Androclus and the Lion,' preserved by Aulus Gellius; a work against the Jews, to which Josephus replied in his work *Against Apion*; and one in praise of Alexander the Great.

Apios, a genus of Leguminosæ, with tuberous, starchy, edible rhizomes. Attention was directed by the French traveller Lamare-Picquot to the North American *A. tuberosa*. Cultivated for a time in North Italy, it has run wild, flowering freely, but not forming fruit. It propagates by tubers.

Apis, the bull worshipped by the ancient Egyptians, who regarded it as a symbol and incarnation of Osiris, the husband of Isis, and next to Râ, the great divinity of Egypt. A sacred court or yard was set apart for the residence of Apis in the temple of Ptah at Memphis, where a numerous retinue of priests waited upon him, and sacrifices of red oxen were offered to him. His movements, choice of places, and changes of appetite were religiously regarded as oracles. It was an understood law that Apis must not live longer than twenty-five years. When he attained this age he was secretly put to death, and buried by the priests in a sacred well, the popular belief being that he cast himself into the water. If, however, he died a natural death, his body was solemnly interred in the Temple of Serapis at Memphis, and bacchanalian festivals were held to celebrate the inauguration of a new bull as Apis. As soon as a suitable animal was found having the required marks—black colour with a white square on the brow; the figure of an eagle on the back, and a black knot in the shape of a cantharus under the tongue (*scarabeus*)—he was led in triumphal procession to Nilopolis at the time of the new moon, where he remained forty days, and was afterwards conveyed in a splendid vessel to Memphis. The worship of the golden calf by the Israelites in the wilderness, and also the employment of golden calves as symbols of the deity by Jeroboam, have been very generally referred to the Egyptian worship of Apis.

Aplanatic Lens, an achromatic lens corrected for spherical aberration, so that all rays that come from one point and pass through the lens are focussed at a point; specially useful in photography.

Apnoea, cessation of breathing, following a period when respiration has been abnormally active—e.g. after artificial respiration, or, on a small scale, when deep breaths are taken before diving. It is usually attributed to the saturation of the blood with oxygen, but it also follows excessive stimulation of the vagus nerve, independently of the state of the blood.

Apoc'alyptse. See REVELATION OF ST JOHN.

Apocalyp'tic Number is the mystical number 666, spoken of in the Book of Revelation (xiii. 18). Among the Greeks and Hebrews the letters of the alphabet were used to denote numbers. Hence such letters must be taken as will, when used as numbers, make up 666 (either in the Greek or Hebrew alphabet) as the letters of the name in question. The best solution of the riddle is 'Neron Kesar,' the Hebrew form of the Latin 'Nero Cæsar.' The vowels *e* and *a* are not expressed in the ancient Hebrew writing. The number represented by NeRON KeSaR would be 666, thus:

$$\begin{array}{cccccc} N & R & O & N & K & S & R \\ 50 & + & 200 & + & 6 & + & 50 & + & 100 & + & 60 & + & 200 & = & 666. \end{array}$$

Other interpretations were adopted in early times, as *Antichrist* and *Lateinos*, the latter being supposed to refer to the Roman empire, and even in more recent times being explained by Protestant controversialists of greater zeal than discretion, as a prophetic allusion to papal Rome. See *ANTI-CHRIST*; De Morgan's *Budget of Paradoxes* (1872).

Apocalyptic Writings are such as, like the prophecies of Daniel, their prototype, set forth in a figurative and pictorial manner the future progress and completion of the world's history, especially in its religious aspects. The two apocalyptic books received into the canon of Scripture are the books of Daniel and the Apocalypse specially so called, the Revelation of St John. But Jewish and early Christian literature produced numerous apocalypses from about 200 B.C. to 200 A.D. Most of them were attributed to famous men of old by their authors, and are accordingly cast in prophetic form, though the author is pretty obviously commenting on past history. They deal largely with the increasing troubles and trials of God's people, and their final redemption and salvation. They are accordingly very valuable sources of information as to the development of Messianic and eschatological ideas before and after Christ. The Book of Enoch (q.v.) is one of the most important. The Psalms of Solomon (q.v.) are Hebrew, the Odes of Solomon Christian. The Sibylline Oracles are described at *SIBYL*, the Testaments of the Twelve Patriarchs at *TWELVE PATRIARCHS*. The Book of Jubilees professes to be a revelation made to Moses of the course of events from Adam, and is divided into fifty periods of fifty years each—hence the name. Other apocalyptic books are the Assumption of Moses, the Apocalypse of Baruch, the Ascension of Isaiah. For Fourth Esdras, see *ESDRAS*; the Shepherd of Hermas is done at *HERMAS*. See also *APOSTLES (TEACHING OF THE TWELVE)*. Some of them are known only from Ethiopic, Syriac, or even Slavonic translations. See Charles on 'Apocalyptic Literature' in *Encyclopædia Biblica*, and his *Testaments of the Twelve Patriarchs* (1908); and Fairweather, *The Background of the Gospels* (1909).

Apocarpous Fruits, in Botany, are those fruits which are the produce of a single flower, and are formed of only one carpel, or of a number of carpels remaining free and separate from each other. The term is derived from the Greek *apo*, implying separation, and *carpos*, fruit.

Apocatas'tasis. See *HELL*.

Apocrenic Acid (Humic Acid, Ulmic Acid) is one of the products of the natural decay of wood or other plant textures, and is found where woody fibre is decomposing in soils. It is soluble in water, and is an intermediate step in the assimilation by living plants of dead vegetable matter.

Apocrypha (a Greek word meaning 'hidden,' 'secret') seems, when applied to religious books or writings, to have been used (1) for such as were suitable, not for the mass of believers, but for the

initiated only; works containing the esoteric or recondite teaching of the faith or sect; (2) works the date, origin, and authorship of which were unknown or doubtful; (3) works which claimed to be what they were not, were spurious or pseudepigraphic. When the Apocrypha is spoken of, the Apocrypha of the Old Testament is generally meant. Another large group may be called the apocryphal books of the New Testament.

The Apocrypha of the Old Testament consists of the books, or parts of books, which are found in the Septuagint or Greek version of the Old Testament, but are not in the Hebrew or Palestinian canon. The Palestinian Jews recognised only the Law, the Prophets, and such Hagiographa or sacred writings as were held to have been composed before the succession of prophets had ceased. The Septuagint, translated from the Hebrew at various dates, ultimately included a number of admittedly later works, some of them originally composed not in Hebrew, but in Greek, whose relation to the old canon was not very precisely defined. These books are: (1) First (or Third) Esdras; (2) Tobit; (3) Judith; (4) The parts of Esther not found in Hebrew or Chaldee; (5) The Wisdom of Solomon; (6) The Wisdom of Jesus, the son of Sirach, or Ecclesiasticus; (7) Baruch; (8) The Song of the Three Holy Children; (9) The History of Susanna; (10) Bel and the Dragon; (11) The Prayer of Manasses, king of Judah; (12) First Maccabees; (13) Second Maccabees. To these must be added (14) Second (or Fourth) Esdras, which is not found in the Septuagint. The more important of these are treated in separate articles. They differ much in character and value. Some show traces of Persian influence; others are mainly Palestinian in origin and spirit; others seem to have been written in Egypt, and reflect Greek or Alexandrian modes of thought. They date mainly from the period 250 B.C. to 100 A.D., and fall into three groups—historical or legendary, prophetic, and didactic or philosophical. Various as they are, the Apocrypha of the Old Testament are invaluable to the careful student of biblical literature and theology. Though manifestly inferior to the canonical books in religious power, they almost everywhere reflect the current religious views of the Jews at the time of Christ's coming, the marvellous continuity of Jewish national feeling, unbroken faith in times of trouble, and unconquerable hope in a noble and more glorious future. Theologically they mark, in some ways, a development from the old Jewish standpoint, and a distinct approximation to the thought of the New Testament; the doctrine of Wisdom, for example, which sometimes seems the personification of the Spirit of God, comes very near the *Logos* conception of the New Testament. The angelology also is nearer that of the New Testament than the Old. Prayer for the dead is sanctioned by 2 Maccabees xii.

The early Greek fathers, using the Septuagint, treated the apocryphal books very much as they did the canonical books; but from the Council of Laodicea (360 A.D.) onwards, the Greek Church had never given the 'ecclesiastical' books (as the Apocrypha came to be called) the same rank as the canonical ones. In the Western Church, Jerome and others recognised only the Palestinian canon; but Augustine gave the weight of his authority to the opposite view. While, in the middle ages, the 'ecclesiastical' books were perhaps most usually distinguished in some measure from the canonical Scriptures in authority, the Council of Trent took Augustine's view, and anathematised those who do not accept the Apocrypha contained in the Vulgate (omitting 1st and 2d Esdras, and the Prayer of Manasses) 'as sacred and canonical.' Luther held them 'not

equal to Holy Scripture, but as good and useful for reading.' The Reformed Church generally emphasised this distinction. The articles of the Church of England declare that they are to be read 'for example of life and instruction of manners,' but not 'to establish any doctrine;' but many of the parts of the Apocrypha read as lessons were excluded from the lectionary sanctioned in 1871. The Westminster Confession, and most of the non-Anglican churches in Britain and the United States, regard them as 'of no authority,' nor to be any otherwise approved or made use of than other human writings. A bitter controversy in Scotland, in 1825-27, as well as in England, led to the omission of the Apocrypha from the Bibles circulated by the British and Foreign Bible Society; and the quotation from Wisdom iv. 13, 14, on the memorial to Prince Albert at Balmoral in 1862 revived debate on the subject. Many good people regard the Apocrypha, not with indifference, but with antipathy, as books that falsely claim to be part of the inspired Word of God.

Besides those actually included in the Septuagint, there were numerous Jewish apocryphal works, notably the Book of Enoch and others usually called Apocalyptic Writings (q.v.), the Psalms of Solomon, the Book of Jubilees, and others.

The apocryphal books of the New Testament stand on a different footing: no considerable part of the Christian Church has included any of them in the canon, and most of them have been always explicitly rejected as without authority, or as fabulous. But the name has been used of very different works: (1) The books which were at one time recognised in certain quarters as Scripture—e.g. the Epistle of Clement, the Didache, the Shepherd of Hermas, the Epistle of Barnabas. (2) The Apocryphal Gospels, which fall into various classes—(a) the Gospel according to the Hebrews, which is now recognised to have contained genuine elements, though only fragments of it remain; (b) Heretical Gospels, i.e. gospels written in the interests of some sect—e.g. the Gospel of Peter, fragments of which were discovered in 1892; the Gospel of the Ebionites; (c) the Legendary Gospels—e.g. *The Birth Gospels*; the Protevangelium of James, Pseudo-Matthew, the Gospel of the Nativity, the History of Joseph, &c.; *The Gospels of the boyhood of Jesus*—e.g. the Gospel of Thomas; *The Gospels relating to Pilate*—e.g. the Gospel of Nicodemus. (3) Apocryphal Acts—e.g. the Acts of Paul and Thecla, the Acts of Thomas, the Acts of Andrew. (4) Apocryphal Epistles—e.g. the correspondence of Jesus and Abgarus. (5) Apocryphal Apocalypses—e.g. Apocalypse of Peter (discovered in 1892), the Apocalypse of Paul. Much of this literature has been collected together in Tischendorf's volume; see translations by Cowper (1874) and by Walker in the *Ante-Nicene Library* (vol. xvi.).

The *Literature* on the Old Testament Apocrypha is far more abundant and valuable. Both the Apocrypha proper and the Apocalyptic literature are contained in the *Oxford Apocrypha and Pseudepigrapha* (1913), edited by Charles. There is a similar collection in German, edited by Kautzsch, which was published a few years earlier. The best introduction to the Apocrypha is that of Oesterley (1914). The Century Bible Handbooks contain a volume on *The Apocryphal Books* by H. T. Andrews. Among the older books may be mentioned the *Speaker's Commentary* edition of the Apocrypha by Wace. See also the literature mentioned in the articles on the separate books and on Bible.

Apocynaceæ, or APOCYNÆ, a natural order of sympetalous dicotyledons, of about 1000 species, chiefly tropical twining shrubs and large woody lianas, but represented in Britain by the Peri-

winkle (q.v.), and in south Europe by the Oleander (q.v.). The leaves are simple, usually opposite; the flowers regular. The style has often an expanded head, with the stigmatic surface below, whereby self-pollination is prevented. The milky juice is usually poisonous, but sometimes drinkable (see COWTREE). It is a frequent source of rubber (Landolphia). Some yield indigo, and a few (Carissa, Hancornia) bear edible fruits; but the majority are poisonous, notably the Tanghin (Tanghinia), or ordeal-seed of Madagascar. Canadian hemp (*Apocynum cannabinum*) yields a strong fibre, long known to the Indians. Some Apocynaceæ are cultivated as hot-house plants, especially *Allamanda*. See DOGBANE, STROPHANTHUS.

Apocynum. See APOCYNACEÆ, DOGBANE.

Apodictic (from the Greek verb 'to prove'), a logical term signifying a judgment or conclusion which is necessarily true; or, in other words, a judgment of which the opposite is impossible. No apodictic judgment can be founded on experience.

Apogamy. See FERN, REPRODUCTION.

Apogee (Gr. *apo*, 'from,' and *gē*, 'the earth'), properly speaking, the greatest distance of the earth from any of the heavenly bodies. Its application, however, is restricted to the sun and moon, the sun's apogee corresponding to the earth's aphelion, and the moon's apogee being the point of its orbit most remote from the earth. Apogee is opposed to perigee.

Apolda, a town of Thuringia, in the former territory of Saxe-Weimar-Eisenach, 9½ miles NE of Weimar by rail. It is a place of much industrial activity, having extensive manufactures of hosiery, which are amongst the most important in Germany. There are also dye-works, machine-works, and bell-foundries. Pop. 21,000.

Apollinaris the Younger, Bishop of Laodicea in Syria (died 390 A.D.), and one of the warmest opponents of Arianism. His father, Apollinaris the Elder, who was presbyter of Laodicea, was born at Alexandria, and taught grammar, first at Berytus, and afterwards at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavoured to supply the loss by converting the Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions after the manner of Homer, Pindar, and the tragedians; whilst the New Testament formed the groundwork of dialogues in imitation of Plato. But it was chiefly as a controversial theologian, and as the founder of a sect, that Apollinaris is celebrated. He maintained the doctrine that the *Logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualised and glorified form of humanity. This doctrine was condemned by several synods, especially by the Council of Constantinople (381), on the ground that it denied the true human nature of Christ. The heresy styled Apollinarianism spread itself rapidly in Syria and the neighbouring countries, and, after the death of Apollinaris, divided itself into two sects—the Vitalians, named after Vitalis, Bishop of Antioch; and the Polemeans, who added to the doctrine of Apollinaris the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration.—Apollinaris must not be confounded with Claudius Apollinaris, Bishop of Hierapolis, in Phrygia (170 A.D.), who wrote an *Apology* for the Christian faith, and several other works, all of which are lost. See Raven, *Apollinarianism* (1923).

Apollinaris Water, an alkaline mineral water containing carbonate of soda, derived from

the Apollinaris Spring in the valley of the Ahr, in the Rhine province. It is rich in carbonic acid, and is popular for table use.

Apollo (Gr. *Apollin*) may be regarded as the characteristic divinity of the Greeks, inasmuch as he was the impersonation of Greek life in its most beautiful form, and the ideal representative of the Greek nation. His mild worship, with its many festivals, accompanied as they were by a cessation from all hostilities; his various shrines at sacred places, with their oracles; and the general idea of his character, had a wide, powerful, and beneficent influence on social and political life throughout the states of Greece. Homer and Hesiod mention that he was the son of Zeus and Leto, and twin-brother of Artemis, but neither states where he was born. The Ephesians believed that he was born in a grove near their city. The most popular legend was that which made him a native of Delos, one of the Cyclades, where his mother Leto, followed by the jealous wrath of Hera over land and sea, at length found rest and shelter, and was delivered of him, under the shadow of a palm or olive tree, at the foot of Mount Cynthus. To spite Hera, who was far from being a favourite with the other goddesses, these hastened to tender their services to the weak and wearied Leto. Themis fed the young Apollo with nectar and ambrosia, the food of the gods, which seems to have suddenly excited the self-consciousness of the infant deity, as he surprised his nurse by starting to his feet, demanding a lyre, and announcing his intention of henceforth revealing to mortals the will of Zeus. The island, proud of having been the birthplace of the god, adorned itself with a robe of golden flowers.

In ancient literature Apollo is described as possessed of many and various powers, all of which, however, appear to be intimately related to each other. He is spoken of: (1) As the god of retributive justice, who, armed with bow and arrows, sends down his glittering shafts upon insolent offenders. In this character he appears in the opening of the *Iliad*. (2) As the instructor of bards, and the god of song or minstrelsy, playing upon the phorminx or seven-stringed lyre, and singing for the diversion of the other deities when engaged in feasting. (3) As the god of prophetic inspiration, especially in his oracle at Delphi. (4) As the guardian deity of herds and flocks, as in his care of the flocks of King Admetus at Pheræ in Thessaly. (5) As the god of medicine, who affords help, and wards off evil. In this sense he is represented as the father of Asclepius (*Æsculapius*), the god of the healing art. (6) As a founder of cities, and the spiritual leader of colonists. According to Homer, he assisted in building the walls of Troy. Cyrene, Naxos in Sicily, and other cities, venerated him as their founder. By the later writers he was identified with Helios, the sun-god, though Homer describes the latter as a distinct deity. Several critics, however, have regarded Helios, or the sun-god, as the true original Apollo—an opinion supported by many probabilities. In the Greek mythology, Apollo forms with the supreme Zeus and Athene a kind of divine triad. He is the beloved son of Zeus, the revealer of his counsel, one in mind and will with him.

The predominance of his worship, carried with them by the wide-spreading Greek colonies, who were under his peculiar care, marks a higher stage in the development of Greek religion, by which a limit was put to the polytheistic idea, and the ethical took the place of the merely physical. Apollo could only be approached with a pure heart, and self-examination was the first condition of his discipleship. It was from the Lycians that his worship came to Greece, and it was by them first that the lofty ideal of the humanisation of deity

was conceived. His worship touched the glowing imagination of the Greek, and thus in Apollo, the saviour and purifier, the guide to self-control without self-mortification, Greek religion may be said to have reached the climax of its development. His oracle at Delphi inculcated a really high standard of religious life for three hundred years, and it was not till about the end of the 6th century B.C. that it began to decline. It is significant that it was the Apollo worship that won the heartiest homage of Socrates. It was to the Greek art and philosophy that it owed its development into the ideal of humanity, and it ever constituted the brightest side of the Greek mind. The most celebrated oracles of Apollo were at Delphi, Abæ in Phocis, Ismenion in Thebes, Delos, Claros near Colophon, and Patara in Lycia. One of the most common epithets for Apollo is *Phæbus* ('the bright' or 'pure'), which occurs in Homer, and later was applied to Apollo more particularly as the sun-god. Another was *Smintheus*, most probably from *sminthos*, 'a mouse,' there being a statue of the god at Chryse with a mouse under its foot, while on coins he frequently carries a mouse in his hands (see Lang's *Custom and Myth*). Among the Romans, the worship of Apollo was practised as early as 430 B.C., and prevailed especially under the emperors. But there can be no doubt that the Romans derived their conceptions of Apollo entirely from the Greeks. It was in honour of him and his sister Diana (Artemis) that the *ludi sæculares* were celebrated every hundred years. The attributes of Apollo are the bow and quiver, the cithara and plectrum, the snake, raven, shepherd's crook, tripod, and laurel; less frequently, the grasshopper, cock, hawk, wolf, and olive-tree.

In sculpture, he is generally represented with a face beautifully oval, high forehead, flowing hair, and slender figure. The most famous representation of the god is the Apollo Belvedere at Rome, a figure in which are combined the highest intellect

Apollo Belvedere.

with the most consummate physical beauty. It is supposed to be a copy of a bronze votive statue erected at Delphi, and representing the god repelling the Gauls (279 B.C.) from his shrine. From another copy, a bronze statuette at St Petersburg, known as the Stroganov Apollo, it is found to have been an *ægis*, not a bow, that the figure held in the left hand. The statue (upwards of 7 feet high) is naked, but a cloak fastened round the neck hangs gracefully over the extended left arm; the expression of the face is one of calm and godlike triumph, mixed with 'beautiful disdain.'

This great work of art was discovered in 1495 amid the ruins of ancient Antium, and purchased by Pope Julius II., who placed it in the Belvedere of the Vatican, whence the name it bears. The left hand and the right fore-arm, wanting in the statue as discovered, were restored by a pupil of Michelangelo.

Apollodor'us, (1) an Athenian painter, who flourished about 408 B.C., and was the predecessor of Zeuxis. He introduced improved colouring and distribution of light and shade.—(2) An Athenian grammarian who flourished about 140 B.C., wrote a work on mythology, giving an arrangement of old myths from the earliest times to the historical period; also a geography, a chronicle in iambic verse, and several grammatical works. The account of the mythology and the heroic gods of Greece, known as the *Bibliotheca*, is the only work preserved (except a few fragments). It is a valuable work, but is reckoned by some only a later extract from a larger work by Apollodorus. See Frazer's edition, with translation, &c. (1921).—(3) Another Apollodorus was a celebrated architect in the time of the Emperor Trajan, by whom he was employed to construct a bridge over the Danube in Lower Hungary. He was sentenced to death in 129 A.D. by Hadrian, offended at his fearless criticism of a temple designed by the emperor himself.

Apollon'ius. (1) APOLLONIUS OF RHODES (born in Alexandria about 240 B.C., but long resident in Rhodes) wrote many works on grammar, and an epic poem entitled the *Argonautica*, marked rather by learning and industry than by poetical genius, though it contains some truly artistic passages, such as those exhibiting the growth of Medea's love. It was greatly admired by the Romans, was translated into Latin by Publius Terentius Varro, and was imitated in a wholesale manner by Valerius Flaccus. There are editions by Merkel (1854), Seaton (1888), and Mooney (1913).—(2) APOLLONIUS OF PERGA, who flourished 250-220 B.C., is classed with Euclid, Archimedes, and Diophantus among the founders of mathematics. His work on conic sections has been preserved, partly in the original Greek, partly in an Arabic translation. He not merely summed up all that was then known on the subject, but made many valuable discoveries.—(3) APOLLONIUS OF TY'ANA in Cappadocia, born three or four years before the Christian era, was, according to Philostratus, a zealous teacher of the neo-Pythagorean doctrines, who claimed a commission from heaven to teach a pure and reformed religion. He soon collected a considerable number of disciples, travelled through a great part of Asia Minor, and ultimately made his way to India, in order to become acquainted with the doctrine of the Brahmins. On this journey he stayed for a time in Babylon, was introduced to the Magi, and at last reaching the court of King Phraortes, in India, made the acquaintance of the most notable Brahmins. When he returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity, rather than the power of working miracles. He was patronised by Vespasian, and followed him to Egypt. After extensive travels in Spain, Italy, and Greece, he was accused of having conspired with Nerva against Domitian. Ultimately, he appears to have settled in Ephesus, where he opened a neo-Pythagorean school, and continued his teaching until he died, nearly one hundred years old. His history was not written till more than a hundred years after his death, by Philostratus (q.v.). It contains a mass of absurd-

ities and fables, through which an outline of historical facts and the real character of the man are perhaps discernible. After his death, he was worshipped with divine honours, temples were built to him, coins struck in memory of him. The notorious English freethinker Blount, and Voltaire, wrote to prove the similarity or superiority of Apollonius to Christ. Baur's theory is, that Philostratus invented most of the story of Apollonius as a heathen saviour, simply to be a counterpart and rival to Christ. See Froude's *Short Studies*, and works by Whitaker (1906), Groves Campbell (1909), and Conybeare (1912).—(4) APOLLONIUS, surnamed DYSCOLOS (or 'ill-tempered'), of Alexandria, lived in the 2d century. Some of his grammatical works were edited by Bekker. He was the first who reduced grammar to a system. His reputation was so high that Priscian calls him *grammaticorum princeps* (the prince of grammarians), and follows him somewhat closely.

Apollon'ius OF TYRE, the hero of a Greek metrical romance, very popular in the middle ages. It relates the romantic adventures of Apollonius, a Syrian prince, as well as those of his wife, who was parted from him by apparent death, and his daughter, and closes with the happy reunion of the whole family. The original no longer exists; but there are three very early Latin versions, of which one was published by Welser (Augsburg, 1595); another is to be found in the *Gesta Romanorum*, and the third in the *Pantheon* of Godfrey of Viterbo. From this Latin source have proceeded the Anglo-Saxon version of the 11th century (ed. by Zupitza, 1896), the Spanish version of the 13th century, and several French and Italian versions in prose and verse of the 14th and 15th centuries. Shakespeare treated the subject in his drama of *Pericles*, mainly following the version of Gower in his *Confessio Amantis*, itself based on the *Pantheon* of Godfrey of Viterbo. The romance was rendered into German, probably from the *Gesta Romanorum*, by a Vienna physician, 'Heinrich von der Neuenstadt,' about 1300, in a poem of 20,000 lines (ed. Singer, 1906). A hitherto unknown Middle German prose version of the story was edited by Schröter in 1872. Simrock narrates the story as it is given in the *Gesta Romanorum*, in his *Quellen des Shakespeare* (1872). See Hagen, *Der Roman vom König Apollonius* (1878); Klebs, *Die Erzählung von Apollonius aus Tyrus* (1899).

Apollos, an Alexandrian Jew, described in the Acts of the Apostles as an eloquent man, and mighty in the Scriptures, knowing only the baptism of John, who on coming to Ephesus (54 A.D.) was more perfectly taught by Aquila and Priscilla. He was a distinguished fellow-labourer of the apostle Paul, and in Corinth was especially successful as a Christian teacher, inasmuch that a party in the church called themselves by his name (1 Cor. iii. 4). By many he has been regarded as the author of the Epistle to the Hebrews.

Apollyon (Gr., 'the destroyer'), or ABADDON. See ASMODEUS.

Apologetics (a word derived from Gr. *apo*, 'from,' and *logos*, 'speech'—something spoken to ward off an attack) technically denotes that branch of theology which is concerned with the defence of Christianity. The term was taken over from common Greek usage. The *Apology of Socrates*, for instance, is the title of the book containing the speech which Socrates made before the Athenian court in self-defence. Newman's *Apologia pro Vita Sua* is another illustration of the use of the term in its technical sense.

As a distinct branch of theological science, apologetics cannot be dated back before the 18th century, though of course a vast number of 'Apologies'

were written in the preceding centuries. Christianity was put upon its defence from the very earliest period of its existence, and in 1 Peter iii. 15 it is said to be the duty of every Christian to be 'ready always to give answer to every man that asketh you a reason concerning the hope that is in you.' Many of the New Testament books were written in defence of the faith, and are therefore entitled to be called 'Apologies.' The fourth gospel, for instance, was written to prove that 'Jesus is the Christ, the Son of God' (xx. 31). The purpose of the Epistle to the Hebrews was to demonstrate the superiority of Christianity to Judaism. Even the Acts of the Apostles is claimed by some scholars as an 'Apology,' because the writer throughout seems to be insisting upon the right of Christianity to exist in the Roman empire.

The 2d and 3d centuries produced many very important Apologies. The earliest was the recently discovered *Apology of Aristides*, written in the reign of Hadrian (c. 130). One of the best known of the Apologies is that of Justin Martyr (c. 150); while Tertullian's still more famous *Apologeticus*, perhaps the finest specimen of its kind, is one of the most notable defences of the faith ever produced. Less important works are the Apologies of Quadratus, Minucius Felix, Athenagoras, and Melito. The attack of Celsus on Christianity called forth a notable reply from Origen (250), and the criticisms of the Neo-Platonists, headed by Porphyry, were met by Eusebius of Caesarea and Theodoret. Augustine's *City of God* was written as a reply to the taunt that the downfall of the Roman empire was due to the corruptions introduced by Christianity. In the scholastic period valuable contributions were made to the subject by Anselm (the inventor of the ontological argument), Abelard, and Thomas Aquinas. The wave of scepticism which followed in the wake of the Reformation in the 17th century produced two well-known books, the *De Veritate Religionis Christianae* of Hugo Grotius, which may be said to have laid the foundation of the science of apologetics, and Pascal's *Thoughts*. It was in the 18th century, however, that the real formulation of the science of apologetics took place. The challenge to Christianity which came from the Deistic movement in England, and the *Aufklärung* or Illumination on the Continent, compelled the leaders of the Christian Church to marshal the arguments in defence of their position. Many treatises of value were produced, some of which have become Christian classics—e.g. Butler's *Analogy*, Paley's *Natural Theology and Evidences of Christianity*, the *Bridge-water Treatises*, &c. In the 19th century the growth of natural science led to an outburst of materialism, and necessitated the restatement of the Christian argument. The discovery of the law of evolution, for instance, compelled Christian apologists to reconsider and remodel the teleological argument which had come to the front in the 18th century mainly through the influence of the *Bridge-water Treatises*. The discoveries made by Biblical criticism, and the abandonment of the old doctrine of verbal inspiration, revolutionised the treatment of the Bible in apologetic. Our extended knowledge of other religions, and the development of the science of comparative religion, raised a new set of problems which claimed treatment at the hand of the Christian apologist. The development of modern philosophy, too, after the revolution introduced by Hume and Kant, raised the question as to the ultimate basis of truth, and forced the defender of the Christian faith to grapple with the issue.

It will thus be seen that the science of apologetics is always relative to the age. The defence varies with the attack. Every new scientific discovery,

for instance, is regarded as a challenge to religion, and the challenge has to be taken up. The apologetic of one age may be futile in another. The argument from prophecy was the sheet-anchor of the Christian defence in the early centuries; to-day it occupies a subsidiary position. Paley regarded the miracles of Jesus as the grand proof of the truth of Christianity. The modern mind is accustomed to regard miracles as a burden to faith rather than as its chief prop and support.

Modern apologists may be divided into two classes: (a) Those who, like Ritschl, are Christocentric, and hold that it is the appeal which Christ makes to the soul that guarantees the truth of Christianity. From this appeal we derive our knowledge of God and all the other truths which form the heart and soul of the Christian faith. (b) Those—and they form the majority—who are Theocentric and start with the conception of God, and obtain the essential Christian ideas either as a natural corollary or an additional revelation. The difference between these two schools of thought corresponds to the distinction which was drawn in the 18th century between 'Natural Theology' and 'Revealed Theology.' The problem really is, can the mind reach the conception of God apart from a divine revelation? The particular difficulties which those who offer an affirmative answer to this question have to meet lie mainly in the realm of philosophy. The principle of the relativity of knowledge, first introduced by Kant (though it was transcended by him), limits knowledge to the region of experience, and says with Tennyson that 'knowledge is of things we see.' This position is claimed as the basis and justification of agnosticism. The Theistic reply takes several lines. It admits that knowledge is limited to experience, but denies that experience is confined to sense-perception; or it claims that man, in addition to his intellectual organs, possesses a religious organ as well, which is capable of transcending the limits that otherwise hem him in; or, thirdly, it boldly challenges the principle itself, and asserts that every act of knowing transcends the limitation, and that unless the principle is transcended no knowledge is possible. Having demolished the attack, the Theistic argument develops the positive argument. Different thinkers prefer different lines of thought. Kant, for instance, laid the main stress on the 'moral argument,' and argued that the facts of the moral life, and especially the 'categorical imperative,' cannot be explained apart from the assumption of the existence of God. J. Caird, following Hegel, held that God is equally the implicate of epistemology, and apart from him the dualism of the universe cannot be resolved. Martineau combined the 'moral argument' with the cosmological—i.e. the argument which claims that the origin of the universe cannot be explained apart from God. Ward, in his *Naturalism and Agnosticism*, which is the most effective and trenchant criticism of the modern sceptical attitude, and his *Realm of Ends*, has developed and restated the teleological argument, which finds in the conception of God the final cause of the universe.

The problems which confront the apologist of Christianity proper are still more numerous. They are partly literary and historical. How far can we trust the narrative in the New Testament? This of course raises the question of the New Testament canon, the date and authorship of the books, the mutual relation of the gospels, and the historical value of the records. The problem is now far more complex than it used to be. A few years ago the apologist considered that if he had proved to his own satisfaction the Johannine authorship of the fourth gospel his work was done, and the narrative

could be used without question. We realise now that such a position is untenable. Authorship and date do not settle everything, and the ordinary canons of historical research have to be applied to the narrative. Nevertheless, after the most rigorous criticism, we are still confronted by the fact of Christ; and it is upon the fact of Christ, the impression which he made upon his contemporaries and the impression which his portraiture in the gospels has made upon each succeeding generation, the moral influence which he exerted upon the world, the uniqueness of his character, his victory over sin and death—it is upon facts such as these that the modern apologist lays the emphasis and raises the superstructure of his defence of Christianity. The two most typical and comprehensive modern books on apologetics are those of Bruce (1892) and Garvie (1914).

Apologue, a fable, parable, or short allegorical story, intended to serve as a pleasant vehicle for some moral doctrine, as that of the 'Belly and the Members,' related by the patrician Menenius Agrippa, in the second book of Livy. The name is applied more particularly to a story in which the actors or speakers are animals or inanimate things. It is identical with the classical *fable*, though it may perhaps be somewhat more complex and sustained than is possible in this form. The New Testament *parable* is a simpler kind of apologue, the incidents of which are necessarily probable. Æsop's fables have enjoyed a world-wide reputation. Luther held such an opinion of the value of the apologue as a vehicle of moral truth, that he edited a revised Æsop, for which he wrote a characteristic preface.

Apomorphia is an alkaloid prepared from morphia by heating with hydrochloric acid. It is a rapid and powerful emetic, but its effects quickly pass off; and it causes very little depression. Its chief value depends upon the ease with which it can be administered by Hypodermic Injection (q.v.), as vomiting can thus be induced even when swallowing is difficult or impossible—e.g. in cases of poisoning.

Aponeurosis (Gr. *apo*, 'from,' and *neuron*, 'a string') is an anatomical term for an expansion of strong fibrous tissue, of which there are many examples in the human body. It is generally confined to expansions from the tendons of muscles, as the lumbar aponeurosis. If a tendon be very broad and expanded, as that of the external oblique muscle of the abdomen, it is said to be aponeurotic. Some muscles, as those on the shoulder-blade, are partially covered by a tendinous expansion (or aponeurosis), to which some of their fibres are attached. In some places aponeuroses form protections over large arteries.

Apophthegm, a terse, pithy saying, conveying some important truth in a few words. The apophthegm is more short, pointed, and practical than the Aphorism (q.v.) need be, and is intended to make a vivid impression on the hearer. Examples are—'God helps them that help themselves'; 'Dr Johnson's 'Patriotism is the last refuge of a scoundrel.' Apophthegm is also spelt **APOTHEGM**.

Apoplexy (Gr. *apoplēxia*—from *plēssō*, 'I strike'—'dissement from a stroke'), a term used in medicine, from early times, of any sudden and unaccountable loss of consciousness, and still popularly employed in much the same way. Apoplexy is in the great majority of cases due to rupture of a blood-vessel in the brain. It is an error to speak of 'apoplexy' in reference to hemorrhages into other organs, as is sometimes done in medical textbooks in such expressions as 'pulmonary apoplexy.' Apoplexy may also be due to embolism (i.e. lodgment of a circulating clot) in a vessel of the brain,

or to thrombosis (i.e. gradual clotting of the blood) in these vessels. Milder cases, from which, as a rule, recovery takes place quickly and completely, are due to minor derangements of the cerebral circulation associated with spasm of the arteries of supply to parts of the brain.

Apoplexy is commonly a disease of advanced life, being very rarely met with below the age of forty. The most important causes which predispose to apoplexy are Atheroma and minute Aneurisms (q.v.) in the brain (see *ARTERIES, Diseases of*), and chronic Bright's Disease (q.v.), which produces great increase in the general pressure of the blood within the vessels. At one time much more importance was attached than now to a thick-set, short-necked habit of body in this connection. Men are more liable to apoplexy than women. A severe *apoplectic fit* or *shock* may come on suddenly or gradually; in either case the patient loses sensation, motion, and consciousness, and lies with flushed face, full slow pulse, and noisy 'stertorous' breathing. If death occur, a clot of blood may be found in the substance or upon the surface of the brain, with the ruptured artery from which it has escaped. If the shock be not fatal, the patient gradually recovers consciousness; and it is found then, if not before, that there is Paralysis (q.v.), partial or complete, of one side of the body. In the course of days or weeks this may pass off, but rarely disappears completely. Mental enfeeblement, as well as bodily, may result. Less severe shocks of apoplexy often occur, with no unconsciousness, but only paralysis, partial or complete, of one side of the body. The approach of apoplexy is often heralded by *premonitory symptoms*—e.g. temporary confusion of thought or loss of memory, giddiness, headache, difficulty of speech, weakness in a limb, double vision; and when these occur, prompt medical treatment, especially attention to regular action of the bowels, may occasionally avert the threatened apoplexy. When a shock of apoplexy has occurred, the patient must be kept lying perfectly quiet, with head raised, and cold applied to it. Medicines which tend to check hemorrhage, as ergot, may be administered, but their use is doubtful, as they raise the general blood-pressure. Purgatives may be given, and bleeding is often valuable. Alcohol is dangerous, and should on no account be used unless by express direction of a medical man. A person who has had one shock of apoplexy is always liable to a recurrence.

Fits, called *apoplecticiform attacks*, met with in other brain diseases—e.g. tumours, general paralysis—closely resemble apoplexy. The condition of a patient suffering from Epilepsy (q.v.), uræmia (see *KIDNEYS, Diseases of*), or narcotic poisoning—e.g. by opium or alcohol—may be very difficult to distinguish from apoplectic unconsciousness. Hence the great importance of caution in dealing with a person found unconscious, lest he be treated, to his imminent peril, as merely drunk, when really suffering from severe apoplexy.

Heat-apoplexy is Sunstroke (q.v.).

Apospory. See **FERN, REPRODUCTION**.

Apostate literally designates any one who changes his religion, whatever may be his motive; but, by custom, the word is always used in an injurious sense, as equivalent to one who, in changing his creed, is actuated by unworthy motives. In early Christian times, the word was applied to those who abandoned their faith in order to escape from persecution; but it was also applied to such as rejected Christianity on speculative grounds (the Emperor Julian, for instance). The apostates in times of persecution were styled variously *Sacrificati*, *Thurificati*, &c., according to the modes in which they publicly

made known their return to heathenism, by offering sacrifices or incense to the gods of Rome. Controversies arose in the early church as to the readmission of those who had so lapsed (see LAPSED and NOVATIAN). The Roman Catholic Church at one period imposed severe penalties on apostasy. The apostate was naturally excommunicated; but sometimes also his property was confiscated, and he himself banished, or even put to death. The term is also applied, not only to those who become perverts to Mohammedanism, usually called *renegades*, but to such as exchange the Roman Catholic for the Protestant faith, and *vice versa*. It has often had great influence on the fortunes of a nation that a prince has apostatised. The most renowned instance in modern history is that of Henry IV. (q.v.), who became a Roman Catholic for peace's sake.

A posteriori reasoning is reasoning from experience, or *backwards* from effect to cause. See A PRIORI.

Apostle (Gr. *apostolos*, 'one sent forth'), a messenger, but especially used to denote the twelve disciples whom Jesus sent forth to preach the gospel—twelve probably because there were twelve tribes. Their names were Simon Peter, Andrew, John (the son of Zebedee), James (his brother), Philip, Bartholomew, Thomas, Matthew (identified with Levi), James (the son of Alphaeus), Thaddæus, Simon, and Judas Iscariot. (The lists in Matt. x., Mark iii., Luke vi., and Acts i., are the same, with the exception that for Thaddæus in Matthew and Mark, we have Judas in Luke and Acts.) Peter and Andrew and James and John have a certain pre-eminence; and Peter and the two sons of Zebedee enjoyed a special measure of their master's love and confidence. The apostles were mainly men of very humble rank, distinguished rather by their character and religious zeal, than by intellectual ability or special training. Subsequently, Matthias was chosen in the room of Judas; and still later, Paul was called to the apostleship. The apostles were twice commissioned to go forth on their work of evangelisation; first during the Galilean ministry, when their labours were restricted to the Jews. The second time was shortly before the Lord's ascension, when they were sent to 'teach all nations, baptising them in the name of the Father, and of the Son, and of the Holy Ghost.' On the day of Pentecost, the apostles received miraculous gifts. It has been held that it was as essential to their office that they should have seen the Lord (1 Cor. xv. 8); that they were inspired (John xvi. 13; Gal. i. 11, 12); and that they had the power of working miracles (2 Cor. xii. 12). Scripture tells nothing about the later life or labours of most of them, and there is no historical foundation for the tradition that the first apostles divided the then known world between them, and that all save St John died a martyr's death. Early tradition, however, connects Philip with Phrygia, Thomas with Parthia, Andrew with Scythia, Bartholomew with India. When controversy arose about the relation of the church to the heathen world, Paul 'the apostle of the Gentiles,' spoke of the office of Peter, as 'the apostleship of the circumcision' (Gal. ii. 7-9). The church did not maintain the office of apostle in its ministry, though it has been contended that the office of the Bishop (q.v.) represents it. The see of Rome calls itself apostolic, as having been occupied by St Peter. The Catholic Apostolic Church has revived the title of apostle. It is also usual to speak of the founder of the Christian Church in a country as the apostle of that country; thus, Gregory is the apostle of Armenia; Boniface, of the Germans; Augustine,

of the English; St Patrick, of Ireland; Columba, of the Scots; Cuthbert, of Northumbria; St Francis Xavier, of India; and, more recently. Eliot is spoken of as the apostle of the Indians.

Apostles, TEACHING OF THE TWELVE, or DIDACHE (Gr., 'teaching'), is a treatise discovered by Bryennios, metropolitan of Nicomedia, and published by him with a Greek commentary (Constantinople, 1833). In sixteen short chapters it describes the two ways of life and of death, the method of divine service, baptism, fasting, prayer, the eucharist, and the ministry in the early church. The ministers are distinguished as permanent or itinerant, bishops and deacons belonging to the former, and prophets and teachers to the latter class. It had previously been suggested that some such document must underlie the seventh book of the *Apostolic Constitutions* (q.v.); and there is certainly a very close connection between this and the eighth book and the treatise. The work is moral rather than dogmatical in tone, and is of great interest for the history of the early Christian Church; but it throws no fresh light on the New Testament canon, and does nothing to settle the Johannine origin of the fourth gospel. The first part of it is probably based on a Jewish manual, *The Two Ways*, introduced into the Christian Church for catechumens. The second part quotes largely from the *Epistle of Barnabas*; so that while the first part dates from the first century, the second can hardly be put before 120 A.D. Within five years of the publication of the original, some 200 treatises, books, and articles on it had appeared. See Harnack's *Apostellehre* (1887), monographs by Taylor (1886) and Rendel Harris (1887), Lightfoot's *Apostolic Fathers*, and Bartlet in Hastings's *Dictionary of the Bible*.

'Apostles' Club, a literary association at Cambridge University in the third decade of the 19th century, which at various dates included amongst its members Tennyson, A. H. Hallam, Trench, Monckton Milnes, Charles Buller, Helps, Spedding, the Lushingtons, Thirlwall, Venables, Merivale, and other men of ability.

Apostle Spoons, silver spoons whose handles ended in figures of the apostles, a common baptismal present in the 16th and 17th centuries.

Apostolic, or APOSTOLICAL, the general term applied to everything derived directly from the apostles, or bearing their character. Either case constitutes apostolicity. The Roman Catholic Church declares itself the Apostolic Church, and the papal chair the apostolic chair, on the ground of an unbroken series of Roman bishops from the chief apostle, Peter. The Church of England, in virtue of regular episcopal ordination from the pre-reformation church, claims to be apostolic; so likewise do the Protestant Episcopal Churches in Scotland and the United States. Apostolic Tradition claims to have been handed down from the apostles themselves. In the same special sense, the name of Apostolic Council belongs to the conclave of the apostles at Jerusalem (Acts, xv.), about the year 50 A.D. Certain congregations or churches, also, which were the special scenes of the labours of the apostles, bore this title for centuries, more especially those of Jerusalem, Antioch, Alexandria, and Rome. But with the ever-increasing spiritual power of the Roman hierarchy, the name came to be more and more exclusively applied to Rome. Hence the term Apostolic See—i.e. the see of Rome; Apostolic Blessing, the blessing of the pope as the successor of St Peter; Apostolic Vicar, the cardinal who represents the pope in extraordinary missions; Apostolic Chamber, a council intrusted with the care of the revenues of the see of Rome. Apostolic Majesty is a title

conferred by the pope on Stephen, the first king of Hungary, and retained by his successors till the revolution. A papal brief or letter is styled apostolic in the same sense.—**APOSTOLICITY**, a term employed to denote that a church possesses the teaching of the apostles. The Roman Catholics use the term as expressing their claim that their church was founded by St Peter.

Apostolical Succession is a phrase used to denote one or both of two things—the derivation of holy orders by an unbroken chain of transmission from the apostles, and the succession of a ministry so ordained to the powers and privileges of the apostles. The theory of the Catholic Church is that its present bishops have the right to ordain in virtue of being the representatives of the apostles, who in their turn represented the Lord himself, the fountain of all grace; and further, that the Lord committed this right or power to his apostles only, that it might be transmitted to all future ages of the church through them, next through bishops ordained by them, then by their successors in regular order. The scriptural argument is mainly based on such passages as Matt. xviii. 18. Opponents of this theory maintain that these words of institution had no such special significance; that, moreover, history shows that God did not take means to preserve such a succession in his church, for it was not till the 4th century that the church officers became a separate class, and in early stages of its history, laymen, as well as church officials, could teach or preach, baptise, celebrate the eucharist, exercise discipline, and perform all special functions now considered valid only if performed by a priest ordained by a bishop in regular succession. They maintain, moreover, that ordination meant merely appointment or admission to office, that no writer of the first two centuries either states or implies that those ordained had any exclusive powers, and that the facility with which ordinations were made and unmade strengthens this inference. The rite now considered essential—the laying on of hands—in ancient times was not universal, and therefore could not have been a necessary element in ordination, being regarded merely as a symbol or accompaniment of prayer, without any special significance. See BISHOP, ORDERS, PRIEST; and on the destructive side of the argument, Hatch's able work, *The Organisation of the Early Christian Churches* (the Bampton Lectures for 1880). See also the Dissertation on 'The Christian Ministry' in Lightfoot's edition of St Paul's *Epistle to the Philippians* (1868), where it is proved that though the episcopate was developed within the last thirty years of the first century, and cannot be dissociated without violence to historical testimony from the name of St John, yet the power of the bishops was at first merely a question of practical convenience, entirely unconnected with sacerdotalism, which was not implied in the term 'clerus,' either by Clement, Ignatius, Polycarp, Justin Martyr, Irenæus, or any father until Tertullian, and even by the latter was qualified by his assertion of an universal priesthood in believers. Lightfoot proves that sacerdotal views were due to Gentile influences, but found support in Old Testament analogies, and that Cyprian was the first to make those sacerdotal assumptions for the clergy which have since become so prevalent within the Catholic Church.

Apostolic Brethren, the name given in Italy, towards the end of the 13th century, to a sect which opposed the worldly tendencies of the church. Its founder was Segarelli, a weaver in Parma, who went about Italy preaching repentance and the need of a return to the mode of life of the apostles, including the primitive community

of goods. After twenty years of undisturbed activity and growing influence, the movement was condemned by popes Honorius IV. and Nicholas IV., and, in 1300, Segarelli perished at the stake, with many others, both men and women. Dolcino, a more energetic and cultivated man, now headed the orphan sect, and fortified a mountain near Vercelli; but after a gallant defence, compelled by famine to submit, he was tortured, and burned at the stake (1307).—A Gnostic sect of the 3d century took the same name; as also a body of persons near Cologne in the 12th century.

Apostolic Constitutions and Canons, both ascribed by tradition to Clemens Romanus, are notes of ecclesiastical customs held to be apostolical, written in the form of apostolic precepts. The *Constitutiones Apostolicæ*, consisting of eight books, were probably composed in Syria, and contain, in the first six books, a comprehensive rule for the whole Christian life. These are founded on the *Didaskalia Apostolorum*, which was probably written about the middle of the 3d century; while the seventh book, with the eighth, is thought to be founded on the *Teaching of the Twelve Apostles* (see above). The *Constitutiones* may belong to the 4th century. The eighth book was put together for the use of priests, and relates only to the sacred offices. Interpolations, however, were afterwards introduced. The *Canones Apostolici*, which were also recognised by the church, were composed at a later period. The first fifty, compiled probably in the 5th century, and translated from Greek into Latin by Dionysius the Younger, were alone acknowledged by the Latin Church. The Greek Church, on the other hand, accepted the thirty-five canons put forth, according to some, in the beginning of the 6th century; and this became a point of discord between the churches. Both collections were probably looked upon at first as apostolic traditions merely, but later came to be looked upon as due to the apostles themselves. See Bunsen's *Hippolytus*.

Apostolic Fathers, the name given to the immediate disciples and fellow-labourers of the apostles, and, in a more restricted sense, to those among them who have left writings behind them. Those specially so called are Barnabas, Clement of Rome, Ignatius, Hermas, and Polycarp. Papias of Hierapolis is also included by Irenæus, but this is probably an error. The writings of the apostolic fathers, as to their form and subject, may be looked upon as a continuation of the apostolic epistles, though far inferior to them in spirit. Their main purpose is to exhort to faith and holiness before Christ's coming again.—Editions of the apostolic fathers were published by Cotelierus (Par. 1672), Jacobson (Oxford, 1838), Hefele (1839), Dressel (1857), Gebhart, Zahn, and Harnack (1875-78), Lightfoot (incomplete, with English translation, 1877-85; smaller ed. completed by J. R. Harmer, 1891); and one, with an English translation, was begun in 1912 by Kirsopp Lake (Loeb Classical Library). There is another English translation in Clark's *Ante-Nicene Library*. See Donaldson's *Apostolic Fathers* (1874); also FATHERS OF THE CHURCH, and the articles under each name.

Apothecary, the name formerly given in England and Ireland to members of an inferior branch of the medical profession. Many were persons practising without any license; but the licensed apothecary frequently kept a shop in which he sold drugs and made up medical prescriptions, in this respect competing with the chemist and druggist. But he was entitled to attend sick persons, and prescribe for them. The term apothecary is still a legal description for licentiates of the Apothecaries' Society of London

(under the Apothecaries Acts of 1815 and 1874), or of the Apothecaries' Hall of Ireland. In Scotland there never was a class corresponding to the English apothecaries. See CHEMISTS AND DRUGGISTS; and Barrett's *History of the Apothecaries of London* (1903).

Apotheosis, the raising of a mortal to the rank of a god, is only a particular case of spirit-worship and of ancestor-worship—a special application of the animistic principle. The belief in the immortality of the dead is at once its cause and the condition of its being granted. The honours paid to the Chinese philosopher Confucius present the only example of a pure apotheosis, without any admixture of mythological elements. Apotheosis has had greater influence on political order than on religious conceptions. It has been the instrument of theocracy and of monarchy, the foundation of the divine right of kings. Born of the worship of the dead, it rapidly degenerated into the adoration of the living. Over all the world, sorcerers, chiefs, kings, and conquerors have turned to account this logical consequence of animism. The Peruvian of Pizarro's time, the Chinese, the Japanese, have their sacred kings, sons of the sun or moon. In Egypt the Pharaohs and the Ptolemies took their place at the same moment on the throne and on the altar. Alexander declared himself the son of Ammon, and insisted at last on the same honours as were due to his divine parent. At Rome the apotheosis of the Æneas of fable, and of the legendary Romulus, was but the prelude to that of Cæsar. Augustus in his turn became a god; while declining the adulations of the senate, he let himself be deified everywhere except at Rome. In every kingdom temples sprang from the ground, and colleges of priests were instituted for the service of the new deity, whose praises were chanted in unison by Virgil, Horace, and Ovid. Nor was sincerity wanting to that enthusiasm. At the end of frightful civil wars, the world hailed the era of peace. Augustus was quick to see the political advantage of this universal idolatry. It linked the whole empire together, the sacred person of the emperor becoming the guarantee for all its institutions. The cult was assiduously spread, and when once it was linked to the fundamental worship of mankind, that of ancestors, manes, lares—the most tenacious form of animism, particularly dear to the Romans—it proved too strong even to be weakened by the vices and folly of a Caligula or a Nero, or the outrage of an imperial decree requiring divine worship also for a Poppæa or an Antinous. An analogy has been pointed out between apotheosis and the canonisation decreed by Christian pontiffs; and traces of the Roman usage survive in the inveterate notion in the monarchies that grew out of the ruins of the old Roman empire, of the 'divinity that doth hedge a king,' extended even to every head that wore a crown. By none was it claimed with more perverse and fatal tenacity than by some of the least godlike of our English kings.

Appalachians, a great mountain-system of North America, nearly parallel with the Atlantic coast, named from the Appalaches, a local Indian tribe, and extending from the Gulf of St Lawrence SSW. to the west central portion of Alabama. It is the parent of many of the rivers of the Atlantic States; but several large streams break its continuity; and one, the river Hudson, is a tidal channel which carries even sea-going vessels through the range, a phenomenon very unusual in any part of the world. The Appalachians consist, in the main, of various parallel ranges, separated by wide valleys. Locally, the Appalachians have various names—e.g. the Green Mountains of Vermont, the

Catskills, the Smoky Mountain Ridge of North Carolina and Tennessee; and west of the South Mountain of Pennsylvania the great Alleghany Ridge (see ALLEGHANY MOUNTAINS) often gives name to the whole system. Their highest points occur in North Carolina, where Mitchell's Peak reaches the height of 6688 feet. Coal is widely distributed, and the entire anthracite field and part of the bituminous field of Pennsylvania and other states lie in the range. Of metals, by far the most important is iron; but gold occurs in small quantities, and zinc, lead, and others are found.

Appalachicola, a river formed by the junction of the Chattahoochee with the Flint, in Georgia, flows through Florida into the Gulf of Mexico.—APPALACHICOLA is also a cotton-shipping seaport on the river.

Appanage is not an English legal term, but in France of old it signified the assignment or conveyance by the crown of lands and feudal rights to the princes of the royal family, that they might be enabled to maintain themselves according to their rank. In England, the duchy of Cornwall may be said to be an appanage of the Prince of Wales.

Apparitions. In all ages of the world and amongst all races of the earth men have claimed to see, sometimes in broad daylight, sometimes in the darkness of the night, phantasms of human shape, of animals, or of spiritual beings, appearing without material cause, and vanishing as mysteriously as they came. Amongst primitive races at the present time the reports of travellers and anthropologists show that these phenomena are of occasional occurrence, as they are also among civilised men. They have without doubt played an important part in the religious history of the race. For upon the occurrence of these phantasms, coupled with the evidence derived from dreams, delirium, and the pseudo-possession of epilepsy, the belief in a spiritual world amongst primitive races appears to be founded (see ANIMISM). In medieval times apparitions of spiritual beings—angels or devils—appear to have been not infrequent, as we may read in the lives of the saints. Even Luther is reported to have thrown his ink-bottle at an apparition of the devil in the Wartburg at Eisenach. The appearance of the Virgin at Lourdes is an instance in modern times. The late Dr F. G. Lee assured the present writer that when he was preparing one of his books on ghosts he was repeatedly assailed in his study by demons in the shape of monstrous animals. In the witchcraft trials of the middle ages the devil or his ministers are reported as appearing to the witch, sometimes *in propria persona*, sometimes in the shape of various animals—dogs, cats, toads. Bystanders, and especially the bewitched persons, claim occasionally to have seen these familiar spirits or the ghostly figure of the witch herself. The evidence, however, in most of these cases is quite untrustworthy. The witch's own confession was generally wrung from her under torture, or in England, where torture was illegal, after enforced sleeplessness and starvation, or threats which were equally effective. The desired confession would be put into her mouth, and in her enfeebled state of mind and body a suggestion of this kind would be liable to give rise to a false belief in the mind of the unhappy victim herself. As regards the other witnesses, the testimony was frequently given long after the event, or it proceeded from professional, and therefore interested, witnesses, such as Matthew Hopkins, the well-known witch-finder. It seems probable, however, in a few cases (see, for instance, the evidence of John Sterne, gentleman, at the trial of the Chelmsford witches in 1645), that apparitions were actually seen by the witnesses

and, it is likely enough, by the witch herself. Witchcraft has survived into modern times in the form of what are called 'Poltergeist' manifestations, the cases occasionally reported in which children or hysterical servant-girls surreptitiously ring bells and throw about the kitchen crockery. In a few fairly well authenticated cases the prime agent has claimed to see a human apparition. The evidence of disinterested witnesses is more credible; see, for instance, the curious apparitions reported by some of the witnesses in Mary Jobson's case (*The Miraculous Case of Mary Jobson*, by Dr Reid Clanny, F.R.S., 1841).

Within the last two or three centuries, however, as the belief in direct spirit intervention has waned, apparitions of angels or demons have almost ceased in Protestant countries. Out of 1112 recent apparitions described in the census instituted by the Society for Psychical Research (see the table below) only twelve represented angels or religious subjects, and only thirty-three were described as 'grotesque, horrible, or monstrous.' Another form of apparitions has taken their place—phantasms of the human figure, often representing the dying or the dead. Cases of this kind were recorded, indeed, in classical times. There is a well-known story of a death-warning related by Cicero (though the figure in this case seems to have appeared only in dream). But they have assumed more prominence since the Reformation, and are not infrequently reported as occurring at the present day.

Such then, briefly, are the alleged facts with which we have to deal. To the mediæval, as to the ancient, world there seemed but two alternatives—to deny the facts, or to accept the conclusion that the spirits of angels and devils or of dead men and women could show themselves to mortals. The progress of science has relieved us from the awkward dilemma. We need no longer impugn the veracity of the ghostseers; nor are we, on the other hand, compelled to accept the statement of their alleged experience as evidence constraining us to accept their belief. Their ghosts are of the stuff that dreams are made of; they are in technical language Hallucinations (q.v.). Modern psychophysiology has taught us that the act of perception is an extremely complex one, in which the mind frequently plays a more important part than the senses. When we see anything—a table, or the figure of a friend—the perception, the picture presented to consciousness, is by no means a simple replica of the image impressed on the retina by the rays of light. The senses furnish only the raw material, which the mind, by means of associated ideas, works up into a finished picture. Thus every perception, as Taine has said, is a true hallucination; and conversely, every hallucination is a false perception. In some cases, it is probable, the hallucination may be described as an anomalous reaction to a sensory stimulus; a distorted or exaggerated perception. In other cases, as, for instance, in some hypnotic hallucinations, the process is apparently initiated in the brain itself. But in all cases the hallucination is a real perception. When a man sees a ghost, he is as much entitled to say he has *seen* it as when he sees a table; the difference, that the table is there and the ghost is not, is psychologically unimportant. In other words, the difference between perception and hallucination lies, not in the nature of the sensory stimulus, but in that of the perceiving organism. We need not here touch on the hallucinations which are conditioned by abnormal or morbid conditions in the organs or in the nerves proceeding from them, or those which are due to disease in the brain itself. Persistent apparitions are, of course, associated with many morbid conditions—delirium, visceral disease, mania. But

the isolated hallucinations with which we are here chiefly concerned do not necessarily imply any greater deviation from normal health than the dreams which invade our nightly sleep. It is precisely in dreams that we find their nearest analogies; and the anomalous functioning of the perceptive centres which produces a hallucination is, according to some writers, rendered possible only by a slight 'dissociation' of the cerebral mechanism, such as we find more fully developed in sleep.

This theory, founded originally on the phenomena of disease and dreams, has received overwhelming confirmation in recent years through the study of hypnotism. It is one of the commonest and most effective of platform tricks—a trick which requires no previous education on the part of the subject—to suggest hallucinations. The hypnotised person will dandle a sofa-cushion in the full persuasion that it is a baby; will attempt to decipher the inscription on a moss-grown tombstone, which to the normal perception of the audience presents itself as a wooden chair; or will see sights and hear voices which have apparently no objective basis at all. In a more advanced subject hallucinations of all kinds can be induced after the termination of the trance; and many observers—Bernheim, Beannis, Edmund Gurney, and others—have described experiments in which they made the subject, days or months after the order had been given, see human apparitions, veritable ghosts.

The old-time ghostseers, then, are so far justified. They did see something; it is only their interpretation which was at fault. But the man who claims to have seen a ghost claims in many cases, as we have said, to see it at the time of a death or disaster. The fact that we can now accept the first part of the ghostseer's story predisposes us favourably towards the other half. For it is difficult summarily to reject so much human testimony, seeing that its substantial accuracy, in part, has been already vindicated against the sceptics.

It was with the view of investigating these and kindred problems, such as the alleged marvels of spiritualism, that the Society for Psychical Research was founded in 1882. The society has from the outset worked by scientific methods, and has so far as possible allied itself with scientific investigations in kindred fields. Its members have included many well-known men of science, as well as men of distinction in other fields; Henry Sidgwick, Balfour Stewart, Sir W. Crookes, Sir Oliver Lodge, Sir W. F. Barrett, Professor W. James, and the Earl of Balfour have served as its presidents.

The first thing, obviously, was to ascertain the facts. For this purpose it was useless to rely on the records of the past. In a delicate investigation of this kind, data of the utmost attainable precision are requisite. And since the occurrence of sporadic hallucinations amongst persons in normal health is admitted, their supposed connection with a death or other crisis must, in the absence of precise data, be regarded as merely another instance of the well-known fallacy of counting the hits and ignoring the misses. At the instance, therefore, of the International Congress of Experimental Psychology of 1889, Professor H. Sidgwick, assisted by a committee of the society, undertook to institute an inquiry into the nature and distribution of sporadic hallucinations amongst the sane. The results are fully described in vol. x. of the society's *Proceedings*. 17,000 persons were questioned by the committee. In the event 655 out of 8372 men, and 1029 out of 8628 women, or 9.9 per cent. of the whole number, could recall having experienced a sensory hallucination at some time in their lives, many persons more than one. Of the whole number

of hallucinations described, about two-thirds affected the sense of sight; and of these visual hallucinations, realistic apparitions of the human figure formed about 75 per cent., as will be seen from the following table, which includes those cases only in which details of the apparition were given at first hand.

Nature of Apparition	Within the preceding Year.	Within Ten Years.	More than Ten Years earlier	Total (including those not dated).

Out of the whole number of apparitions representing a living human being, viz. 381 (the number includes 29 hallucinations classed in the foregoing table under the heads of 'Incompletely developed' and 'Visions'), there were 65 cases reported in which the apparition had occurred within twelve hours of the death of the person represented, and before the fact of the death had become known by normal means by the percipient. Analysis of the figures showed, however, that they are defective in two opposite directions. On the one hand, as will be seen from the table, the figures for the most recent year are proportionately much larger than those for the whole decade; and the figures for the most recent decade nearly equalled those for the whole of the preceding period, which averaged about twenty years. It is clear that hallucinations which are regarded as having no special significance tend rapidly to be forgotten. On the other hand, those apparitions which seemed to coincide with a death were remembered too well; they grew proportionately more numerous—probably through exaggeration of the closeness of the time coincidence—as the accounts receded into the past. After making liberal allowance for both these and other sources of error, the committee came to the conclusion that about 1 recognised hallucination in 43 must be reckoned as having coincided with the death of the person represented. On the other hand, the proportion—if the coincidence was due to chance alone—would be 1 in 19,000.

If the allowances made by the committee for all sources of error incident to testimony in matters of this kind were sufficient, a causal connection between some of the hallucinations reported and the concomitant death was thus indicated. Such a connection is found in the theory of telepathy. Ever since its foundation in 1882 the chief investigators of the Society for Psychical Research have given much attention to the alleged possibility of communication between mind and mind or brain and brain without the intervention of the ordinary channels of sense. The classic experiments designed to test the possibility of such communication are those carried on in 1889-91 by Mrs Henry Sidgwick in conjunction with the late Professor Sidgwick and Miss Alice Johnson (*Proceedings S.P.R.*, vols. vi. and viii.). The results show a percentage of successes, in the transference of images of numbers,

pictures, diagrams, imaginary scenes, &c., far beyond such as chance could afford. The precautions taken to guard against communication through the ordinary senses, even on the assumption of hyperæsthesia of hearing on the part of the percipient, seem to have been sufficient, and have never been effectively criticised. But obviously, so long as the two parties to the experiment are separated by no greater distance than a single room, or no more serious obstacle than a door or a wooden ceiling, the possibility of such communication can never seem completely excluded. And in any case the demonstration that one mind or brain could act upon another mind or brain at the distance of a few yards would not in itself justify the extension of such action to the phenomena of death apparitions, in which the presumed action must cover an interval of hundreds of miles.

Of late years, however, many successful experiments have been conducted in which the parties have been separated by much greater distances. Of these by far the most striking are the cross-correspondences, the records of which occupy the bulk of the society's *Proceedings* from 1906 onwards. In these experiments several ladies, some of them unknown to each other, have for some years practised automatic writing. The writings so produced, when carefully collated, are found to show traces of reciprocal influence in thought and expression such as seem beyond the possible scope of chance. Collusion would appear to be effectually excluded, it should be said, not merely by the character of the experimenters, but in many instances by the conditions of the experiments themselves and the nature of the results obtained. In these experiments we seem to find proof of an influence emanating from one mind or brain and affecting another mind or brain over a distance measured by thousands of miles—the distance sometimes between India or Boston (U.S.A.) and England. The results of these cross-correspondences, added to the evidence for a supernormal faculty of acquiring knowledge afforded by the trance communications of the American medium, Mrs Piper, which were carefully recorded and collated for several years, have put the hypothesis of telepathy on an almost unassailable basis. But it has not yet won general recognition, nor does it seem probable that it will be accepted until with the facts some explanation of the *modus operandi* can be suggested. A force whose operation is at one time affected by the interposition of obstacles at a distance of a few yards, and which at another time can cross from continent to continent, is like no force known to physical science. And until the matter has been further investigated, it seems that telepathy must be content to wait for full recognition by the scientific world. Meanwhile, as a working hypothesis, it will serve to explain many so-called occult phenomena, and, amongst others, apparitions occurring at the time of a death. The psycho-physiological explanation of the apparition as a hallucination must be regarded as proved. But in face of the high proportion of coincidences with death and other events demonstrated by the census, it is difficult to suppose that the hallucination is in all cases due to the normal preoccupation of the percipient with the image of the deceased. Such a view compels us in the first place to assume in all cases knowledge on the part of the percipient of the deceased's dangerous illness; and demonstrably in many cases such knowledge did not exist. And, again, even if knowledge of the illness had existed in all cases, the reported coincidences are still far too numerous for chance. Accepting telepathy, however, as a working hypothesis, we may assume that the hallucination in such a case is due to telepathic suggestion, just as post-hypnotic

hallucinations are due to verbal suggestion. In fact the recorded cases, when closely examined, are found to conform to such a theory.

The apparitions reported cluster thickly round the moment of death as the centre, occurring most frequently a few hours before, during the period of mortal illness, or a few hours later. No doubt the subconscious dramatic instinct would tend to improve the occasion by shortening the interval; but the evidence of other witnesses is in many cases sufficient to prove the substantial accuracy of the original narrative. It may be added that phantasms seen a few hours after death may still be regarded as due to an impulse received from a living brain, since, as shown by hypnotic experiments and by observations on crystal visions, &c., an impression received subconsciously may wait for hours or even days for a favourable opportunity before emerging into the upper consciousness.

Such an explanation of death wraiths, it need hardly be said, cannot yet be regarded as proved. A spring cannot rise above its source, and even the existence of telepathy is not yet incontrovertibly demonstrated. But it must, at the least, be regarded as provisionally holding the field. The theory derives some further corroboration from a number of cases in which apparitions are reported as coinciding with accidents or other crises. There are also instances recorded in which an apparition of a living person has been experimentally produced from a distance without verbal suggestion. These instances, however, are at present but few in number, and it is much to be desired that further experiments should be made in this direction.

If telepathy from the living may be regarded as furnishing an adequate explanation of apparitions at the time of death, it is held by some that by analogy telepathy from the dead is required to account for apparitions representing the dead. But in fact such apparitions, as shown by the census above referred to, are less than half as numerous as apparitions of the living. Moreover, they can in nearly all cases be explained as subjective hallucinations, conditioned by the preoccupation of the percipient's mind with the thought of the dead. In the rare cases when, for example, such an apparition is seen by a person ignorant of the death, we may still reasonably look, in the first instance, for the source of the apparition in the mind of the living. Such an explanation is again suggested by the phenomena of what are called 'haunted' houses. It would seem as if, in many cases, a nervous infection was communicated from one inmate to another. The facts, as so far investigated—the vague, shadowy character of the figures generally seen, the irreconcilable discrepancies in the descriptions of various observers, the purposeless nature of the manifestations—certainly lend little support to the theory of post-mortem influence.

The alleged occurrence of an apparition to two or more persons simultaneously is by some regarded as presenting insuperable difficulties to the hallucination theory, and as proving in some sense the objectivity of the apparition. But, in the first place, such collective apparitions may in many cases be explained as collective illusions—i.e. misinterpretations of real objects; and in the rarer cases where it is clear that the vision is of a subjective character, it is probably communicated, as a rule, from the original percipient to the others by verbal suggestion. This is no doubt the explanation of the collective visions occasionally seen by crowds of persons, as, for instance, in the year 1880 at Knock, in Ireland. But if these collective hallucinations occur unaided by verbal suggestion, which cannot be regarded as proved, they would still seem capable of explanation by telepathy.

Of the apparitions alleged to have been photographed by the camera, or to be seen and handled at spiritualist séances, it is not necessary to say much. The opportunities for fraudulent manipulation of the photographic plate are numerous. No evidence worth consideration has yet been adduced for the genuineness of any spirit photograph. The results are due in most instances to double exposure; and traces of the process may frequently be seen even by the non-expert.

The apparitions seen at dark séances when forcibly grasped have always turned out to be the medium or a confederate in disguise. In Sir W. Crookes's famous experiments of 1874, his confidence in the medium appears to have led him to take insufficient precautions against fraud. The experiments have never been repeated under satisfactory conditions. In the cases occasionally reported, where the materialised spirit is recognised in a good light as resembling a deceased person, we have occasionally grounds for supposing a hallucinatory transformation in the percipient's mind of the medium's features, a process of which other instances can be found.

Barrett, *Psychical Research* (1912); the publications of the Society for Psychical Research.

Appeal is the bringing before a higher court the judgment of a lower court which the appellant represents as erroneous in fact or law. Formerly this right was a guarantee against political oppression and private extortion; now the aim is to secure uniformity in the administration of justice, and is effected not merely by the reversal, on appeal, of erroneous judgments, but by the knowledge which every judge has of precedents in the Supreme Court, and that his own judgments are subject to appeal. The most important questions connected with the modern system of appeal are: (1) Whether in all cases, of whatever pecuniary value, appeal is allowed, and also whether at all stages, or only after final judgment; (2) On what conditions, as regards time, *interim* execution, and security for costs, appeal is allowed; (3) The relative constitution of the lower and higher courts.

In the civil law, the earliest form of appeal was the *provocatio* from the judgment of a criminal court to the Roman people. For some time the emperor was the only final court of appeal. In the Christian Church, under the judicial system defined in the False Decretals, frivolous appeals direct to the Roman Consistory multiplied enormously. The remonstrances of St Bernard were gradually given effect to by the Lateran and Basel Councils, and wholesome restrictions on the

right of appeal, and in favour of the independence of Cisalpine church courts, passed into most modern concordats. Even the indirect recognition of the judicial supremacy of the pope was in England made a statutory offence under the name of *Premunire*.

In English law, prior to the Judicature Acts, 1873 and 1875, the word appeal was not commonly used. In common law courts, there was a proceeding in 'error' by 'assignment of error' and 'joinder of error.' In Chancery, the appeal was formerly called 're-hearing,' the Vice-chancellor being regarded as the delegate of the Lord Chancellor. Under the modern system of 'fusion,' every judgment in the High Court of Justice (except a judgment of the Court of Probate where leave is required) may by simple motion be submitted to the Court of Appeal, to have it reversed, discharged, or varied. Interlocutory proceedings in chambers may also be appealed to a judge in chambers; and from him appeal lies to the Divisional Court. In the Chancery Division, the judge has the discretion of directing the matter to be argued before him in court, or allowing appeal direct to the Court of Appeal. An appeal in Divorce requires in many cases to be to the 'full court,' not to the ordinary Court of Appeal. This last court consists practically of six Lords Justices of Appeal, sitting in two divisions—one for Common Law Appeal; the other for Chancery, Probate, Admiralty, and Bankruptcy Appeal. An appeal lies to the Judicial Committee of the Privy-council from an Indian or colonial court, but such appeal most frequently requires leave from the court below or the Judicial Committee, and, generally, security has to be given for costs. The law of appeal in Ireland is practically the same as in England.

As regards appeal from the inferior courts in England, an appeal lies from the county court to a divisional court of the High Court of Justice. All determinations in law by justices of the peace (including metropolitan police and stipendiary magistrates) may be brought up for the opinion of a divisional court of the High Court of Justice. As to appeals in ecclesiastical causes, the Privy-council is the Supreme Court of Appeal in all ecclesiastical causes which may originate in the diocesan and provincial courts; but the High Court of Justice, especially in the Chancery Division, may frequently, in questions of trust and property and contract, have to decide purely spiritual questions.

In 1907, after many previous attempts, there was constituted a Court of Criminal Appeal for England (7 Edw. VII. chap. 23). It consists of the Lord Chief-Justice and eight judges of the King's Bench Division. To this court any person convicted on indictment may appeal without leave on a question of law, and with leave on question of fact, or mixed fact and law. He may also with leave appeal against the sentence following on conviction, unless the sentence is one fixed by law. In general, where appeal is allowed, the sentence is quashed and an acquittal entered, but the court has large powers of substituting other convictions and sentences according to the facts and merits. The appellant is entitled to be present, and also to legal assistance, and the certified costs are treated as costs of prosecution. The act does not interfere with the prerogative of mercy, but the Secretary of State may refer a petition for mercy to the court. In cases of exceptional public importance an appeal from the court may be allowed to the House of Lords.

In Scotland, in the Court of Session the judgments of the Lords Ordinary sitting in the Outer House are appealed by a reclaiming note to the First or Second Division of the Inner House.

These appeals are discouraged, except after final judgment by the Lord Ordinary, but they are competent at other stages, though in most cases only with leave of the judge. From all final judgments of the Inner House there is an appeal to the House of Lords within a period of one year. Where the judgment is not final, leave to appeal must be got, unless there has been a difference of opinion among the judges. Pending an appeal, the Court of Session has absolute power to regulate *interim* possession of property or execution of a decree for money.

The Court of Session has exclusive jurisdiction as a Court of Review in *civil* causes over all inferior courts, even in cases where its original jurisdiction is excluded, unless there be an express exclusion of review by statute; and where appeal is excluded, the Court of Session has jurisdiction to set aside their decisions, where they have acted in excess of their statutory jurisdiction. In the latter case, the technical remedy is generally by a note of suspension or an action of reduction. The normal appeal, however, from final judgment in the Sheriff Court is under the Sheriff Court Acts of 1907 and 1913, and lies directly to the Inner House. Cases are often brought up before judgment in the Sheriff Court for jury trial in the Supreme Court. The Court of Session, sitting as the Registration Appeal Court and the Valuation Appeal Court, hears appeals from the Registration Courts held by the sheriffs, from the valuation committees of the commissioners of supply, and from the magistrates in burghs; and there is also an appeal as to excise duties from the justices at quarter sessions.

Within the Sheriff Court itself, the right of appeal from the sheriff-substitute to the sheriff-principal is regulated by the Sheriff Court Act of the year 1907. Appeals from the Small Debt Court are confined to certain grounds mentioned in the Act 1 Vict. chap. 41 (such as malice and oppression and defect of jurisdiction in the judge), and are made to the next Circuit Court of Justiciary.

At common law, the High Court of Justiciary may review the proceedings of all inferior courts in criminal matters, but not on the merits. In cases tried without a jury the appellate jurisdiction of the High Court has been considerably extended and rendered more efficient by the Summary Jurisdiction Act of 1908. The proceedings of summary criminal courts may be brought before the High Court for review by (1) a bill of advocacy, (2) a bill of suspension, (3) an appeal to circuit, and (4) an appeal by stated case. The last, now the ordinary mode, is competent on all questions of law, and is open equally to the prosecutor and the accused. As regards proceedings in a trial by sheriff and jury, the appellate jurisdiction of the High Court is more restricted. Neither the verdict of the jury nor the directions given by the sheriff to the jury can be submitted to review. No appeal lies from a sentence pronounced in the High Court.

In the United States, the distinction between an appeal, which originated in the civil law, and a writ of error, which is of common law origin, is that the former carries the whole case for review by the higher court, including both the facts and the law; while the latter removes only questions of law. An act of Congress of 1875 provides that the judgments and decrees of the circuit courts of the United States shall not be re-examined in the Supreme Court unless the matter in dispute shall exceed the sum or value of \$5000, exclusive of costs. No judgment, decree, or order of a circuit or district court, in any civil action at law or in equity, shall be reviewed in the Supreme Court on writ of error or appeal unless the writ of error is brought, or the appeal is taken, within two years.

Appendicitis, inflammation of the vermiform appendix, a worm-like structure situated in the lower right side of the abdominal cavity and attached to the Cæcum (q.v., and see DIGESTION). The function of this appendix is unknown, but the organ is particularly subject to inflammation, and the inflammation becomes very dangerous when the peritoneal covering of the appendix is affected. Appendicitis may be associated with various organisms, and is set up by the presence in the appendix of small fecal masses, of foreign bodies like seeds, or even by an external injury like a blow. The symptoms, generally speaking, are pain in the lower right region of the abdomen, digestive troubles (especially constipation), tenderness to touch between the navel and the right iliac bone, and feverishness of moderate degree (about 102°). Milder cases are usually treated by palliative means, but severer forms, in which perforation of the appendix takes place, require immediate operation to prevent the development of general peritonitis. In all persons liable to recurring attacks, removal of the appendix between attacks is a sound procedure.

Appendicularia, a genus of Ascidians (q.v.), and type of a small but important order, the members of which retain the larval vertebrate characters which are lost in the more or less degenerate adult sea-squirts. Appendicularia is a minute free-swimming form with a long tail, and closely resembles an Ascidian larva. The brain and dorsal nerve-cord, the long notochord, the two respiratory slits opening directly from the pharynx to the exterior, and other vertebrate structures lost in the adult Ascidians are here retained throughout life, and demonstrate the true position of the class to which Appendicularia belongs.

Appendix Vermiformis. See APPENDICITIS, CÆCUM, DIGESTION.

Appenzell (from *Abbat's Cella*), a double canton in the NE. of Switzerland. It is divided into two divisions—Innerroden and Ausserroden, the former of which is peopled by Roman Catholics, the latter by Protestants, and noted for its dense population. The surface is mountainous, especially in the south, where Mont Sentis attains an elevation of 8220 feet. The chief river is the Sittern, which flows through the centre of the canton. The inhabitants are chiefly employed in agriculture and cattle-keeping; in Ausserroden, however, cotton manufactures and embroidery are carried on. The dialect is peculiar, and the Appenzellers wear a characteristic costume. The canton, once dependent on the Abbey of St Gall, won its independence after a struggle, and joined the seven old cantons in 1452. Area, 163 sq. m.; pop. (1920) 69,968, of whom 55,354 are in Ausserroden.—APPENZELL, capital of the canton, is situated on the left bank of the Sittern, beneath the Sentis; pop. 5000 (Roman Catholics). It has old timbered houses, two convents, and a small trade in linen; and is 14 miles by rail SE. of Herisau (q.v.), the largest town in the canton.

Apperception, a word used by psychologists with some variety of meaning. For Leibnitz it meant something not very different from attention. Herbart and his followers employ it for the 'psychical activity by which individual perceptions, ideas, or ideational complexes are brought into relation to our previous intellectual and emotional life, associated with it, and thus raised to greater clearness, activity, and significance.' Thus in education each new experience is added to an existing 'apperception-mass.'

Apperley, CHARLES JAMES, an English sporting writer, born in Denbighshire in 1777. Educated at Rugby, he married early, and settled in Warwickshire, where he devoted himself to hunting.

In 1821, under the name of 'Nimrod,' he began to contribute such attractive articles to the *Sporting Magazine* that its circulation was soon doubled. The proprietor paid him handsomely, and advanced him money, but his heirs afterwards brought an action against Apperley for its recovery. Nimrod prudently transferred himself to France, where he chiefly resided during the rest of his life. He died 19th May 1843. His best writings are *The Chase, the Turf, and the Road*, which appeared in the *Quarterly Review* (1827), and the *Life of a Sportsman*, to the 1873 edition of which is prefixed a memoir of himself.

Appert, BENJAMIN NICOLAS MARIE, a French philanthropist, born in Paris, September 10, 1797, began about 1816 to introduce into several schools in the Nord department a system of mutual instruction, and in 1820 to teach the prisoners at Montau. Suspected of having aided the escape of two prisoners, he was himself in jail for three months. In 1825 he travelled through the whole of France, in order to discover means of elevating the criminal classes, and recorded the results of his investigations in a journal started for this purpose. From 1841 to 1844 he managed a colony for liberated prisoners and the children of prisoners at Némelfing, in the Moselle department; and afterwards he travelled in Belgium, Germany, and Austria, giving the results of his observations on the management of schools and prisons in several works, marked by great fairness and candour. He also wrote a work entitled *Dix Ans à la Cour du Roi Louis-Philippe*, and, in his *Conférences contre le Système Cellulaire*, strongly opposed the system of solitary confinement. He died about 1847.

Appetite (Lat. *appetitus*, from *appeto*, 'I desire') is generally used of the natural desire for food experienced in health. Its causes are two: (1) a condition of the *stomach*, not yet accurately understood, relieved by taking food; (2) a condition of the *system*, not relieved till the products of digestion begin to be absorbed into the blood.

Alteration of the appetite is perhaps the most common of all the symptoms of disease. Occasionally it is increased. *Morbid appetites* may consist in a desire which is, in character, natural and necessary to the animal economy, but becomes unhealthy when excessive and irresistible. Of this, the hunger which attends marasmus, and the thirst which attends diabetes, may be cited as illustrations. They may consist, further, in a craving for articles or objects which are not in reality deleterious or detrimental, but which do not constitute the ordinary gratification of the appetite, such as the desire for chalk and lime experienced by chlorotic and hysterical women. They may, thirdly, consist in the longings, often complicated with delusions, felt by pregnant women and others, which are injurious, repugnant to nature, and revolting. Georget gives an instance where a wife coveted the shoulder of her husband, killed him in order to obtain the morsel, and salted the body in order to prolong the hideous cannibalism. In such a case the gross longing may be said to constitute the disease; but there are others in which it is one of many symptoms demonstrating the degradation of the mind under general disease, as when the insane devour garbage and excrement, or swallow grass, hair, stones.

Much more frequently the appetite is diminished, and accordingly medicines which increase the appetite and improve the digestion are often necessary. The chief of these *stomachic tonics* are vegetable bitters, as calumba and gentian; dilute mineral acids; meat extracts; pepsin and other digestive agents prepared from the organs of the lower animals. See DIET, DIGESTION, INDIGESTION. FOOD; cf. also THIRST.

Appian (Lat. *Appianus*), a native of Alexandria, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. He was author of a Roman history in twenty-four books, of which only eleven are extant. It was remarkable principally for the plan on which it was written. Instead of proceeding to exhibit chronologically the growth of the empire, its author divided his work into ethnographic sections, recording separately the history of each nation up to the time of its conquest by the Romans. First in order were the books devoted to the old Italian tribes, and afterwards followed the history of Sicily, Spain, Hannibal's wars, Libya, Carthage and Numidia, Macedonia, Greece proper and its colonies, Syria, Parthia, the Mithridatic war, the civil wars, and the imperial wars in Illyria and Arabia. As a historian, Appian is a mere compiler, and not very accurate in his compilation. His geographical knowledge, in particular, is singularly deficient, considering the age in which he lived. One specimen of his blunders will suffice; in his section on Spain, he states that it takes only half a day to sail from Spain to Britain. The standard editions are those by Bekker (1852-53) and Mendelssohn (1879-1905); White's (1912) gives an English translation.

Appiani, ANDREA, styled in his day 'the Painter of the Graces,' was born at Milan, May 23, 1754. His style was formed from a close study of the works of Raphael and other masters of fresco-painting, and his first works were a series of frescoes in Milan. His best works are the frescoes of the myth of Eros and Psyche in the royal villa at Monza, the cupola-paintings in the church of *Santa Maria di S. Celso* at Milan, and *Apollo with the Muses* in the Villa Bonaparte. Napoleon I. patronised him, but after his fall Appiani fell into great poverty. He died at Milan, November 8, 1817.

Appian Way (Lat. *Via Appia*), well named by an ancient writer *Regina Viarum* ('the queen of roads'), was formed, in part at least, by Appius Claudius Cæcus, while he was censor (313 B.C.). It is the oldest and most celebrated of all the Roman roads, and with its branches connected Rome with all parts of Southern Italy. It had an admirable substructure or foundation, from which all the loose soil had been carefully removed. Above this were various strata cemented with lime; and lastly came the pavement, consisting of large hard hexagonal blocks of stone, composed principally of basaltic lava, and jointed together with great nicety, so as to appear one smooth mass. The cost must have been enormous, for the natural obstructions are great. Excavations instituted by the papal government in 1850-53 reopened the road as far as Albano. The railway from Rome to Naples travels east of this restored portion (now called the *Via Appia Nova*), while a direct line passes under the old road six miles from Rome.

Appin (*Apthane*, 'abbey lands'), a beautiful coast district of Argyllshire, extending along the east shore of Loch Linnhe, 15 miles NNE. of Oban. It is the country of a branch of the Stewarts, whom Hogg has celebrated in verse, and a history of whom was published at Edinburgh in 1880.

Appius Claudius. See CLAUDIUS (APPIUS).

Apple (*Pyrus malus*. For the generic character, see PYRUS). This well-known fruit has been very long cultivated, and by that means it has been very much improved. It was extensively cultivated by the Romans, by whom, probably, it was introduced into Britain. The wild apple, or Crab-tree, a native of Britain, and very generally found in temperate climates of the northern hemisphere, is a rather small and often somewhat stunted-looking tree, with austere, uneatable fruit; yet it is

the parent of all, or almost all the varieties of apple so much prized for the dessert. The apple-tree, even in a cultivated state, is seldom more than 30-40 feet high. It has a large round head; the leaves are broadly ovate, much longer than the petioles, woolly beneath, acute, crenate, and provided with glands; its flowers are always produced in sessile umbels, and are various in size, according to the variety. Some are almost as white as pear-bloom, but the great majority are either striped or tinged with rosy tints outside, and some are of bright carmine. All have a delicate

Branch of Apple with young Fruit:
a, piece of the blossom.

fragrance, much more refined than that of pear-bloom. The fruit is roundish, or narrowest towards the apex, with a depression at each end, generally green, but also frequently yellow, light red, dark red, streaked, sometimes even almost black, with the rind sometimes downy, sometimes glabrous, sometimes thickish, and sometimes very thin and transparent, varying in size from that of a walnut to that of a small child's head—the taste more or less aromatic, sweet, or subacid. It is produced on spurs which spring from branchlets of two or more years' growth, and continue to bear for a series of years. The fruit of the apple is, with regard to its structure, styled by botanists a *pome*. The eatable part is what is botanically termed the *mesocarp* (see FRUIT), which, in its first development, enlarges with the calyx, the summit of the fruit being crowned in general by the dried quinefid sepals; the *endocarp* being, when ripe, cartilaginous, and containing in its cells seeds which do not correspond with them in size, but are so free as sometimes to rattle when it is shaken. Dr Hogg has introduced a more scientific classification of varieties, according to the structure of the stamens, the tube, the carpels, and the sepals.

The apple is now one of the most widely diffused of fruit-trees, and for the general fruit-supply of Britain is the most valuable of all. It succeeds best in the colder parts of the temperate zone. It is, however, to be met with on the coasts of the Mediterranean Sea, in Arabia, Persia, the West Indies, &c., but there its fruit is as small and worthless as in high northern latitudes. The varieties in cultivation are by far too numerous. They have been classified with great care by German, French, English, and American writers, by whom the classification and description of apples, pears, and similar fruits has been made quite a matter of science, and entitled *Pomology*. Metzger, in his description of the pomaceous fruits of Southern Germany, describes 89 different kinds of apple, all of which are constant, besides sub-varieties. There are now at least 2000 varieties

cultivated in Great Britain, and perhaps twice that number, for many provincial sorts have as yet escaped the pomologist. New varieties are continually produced from seed; and as the apple is chiefly propagated by grafting—although some few can also be raised by means of layers and cuttings—the older varieties are superseded in many cases by newer ones. But some of the best kinds still in use can be traced back for centuries. The *costard*, from which dealers in apples received the name of costardmongers, still exists, though not largely grown, perhaps on account of the ribbed formation, from which it is believed to take its name, *pomum costatum*. Certain family divisions have been made, popular rather than correct, of apples (as of pears and plums)—e.g. Pippins, Codlins, Russets, Rennets, Pearmain, Calvilles, Crabs, &c. Some kinds, not approved for the dessert, are in high esteem as baking-apples, and others still more acid or austere are preferred for the manufacture of Cider (q.v.).

The apple is grown in Britain either as a standard, an espalier, or a wall-tree, and is variously trained. It was generally grafted on apple or crab stocks, but now a dwarf variety, either the *Paradise* or *Doucin* stock, is largely used to restrict the growth and hasten the time of bearing; and trees thus dwarfed are often very productive when little larger than currant or gooseberry bushes. Some of the varieties of apple are more hardy than others, and are therefore to be preferred for cold or exposed situations. Some of the finest kinds succeed well only when the soil and climate are good. Some kinds are much earlier than others in flowering, some in ripening. It is a mistake to suppose that an early bloomer is therefore an early ripener. The converse is frequently the case with all *fruit-trees*.

The wood of the apple-tree is hard, durable, and fine-grained. The crab is often planted both as an ornamental tree and for the sake of its wood. The bark contains a yellow dye.—As a fruit-tree, the apple requires a fertile soil and sheltered situation. The various uses of the fruit—for the dessert, for baking, preserving, making jelly, &c., as well as for making the fermented liquor called cider—are sufficiently well known. Vinegar is also made from it; and sometimes a kind of spirit, especially in Switzerland and Swabia. It contains *Malic Acid*, which is extracted for medicinal purposes.—The fermented juice of the crab apple is called *Verruice*. It is used in cookery, and sometimes medicinally; also for the purifying of wax. The apple *keeps* better than most kinds of fruit. *Beaufins* or *Biffins* are apples slowly dried in bakers' ovens, and occasionally pressed till they become soft and flat.—The CHINESE CRAB (*P. spectabilis*) is very ornamental when in flower.

In the beginning of the 20th century coreless and seedless apples were, after long experiment, produced in Colorado. For blossom there is only a stamen, a little pollen, and a cluster of tiny green leaves round the forming apple. Hence the tree is immune from the effects of frost and the ravages of the codling moth.

Vast quantities are imported into Britain from France, Canada, the northern United States, and latterly from Tasmania and Western Australia (the latter ripened in our winter). Not till 1845 was apple-growing begun in the neighbourhood of Oregon; but since 1900 the states of Oregon and Washington, together with British Columbia, have become the great apple orchard of the world, producing apples of the very finest quality. Land in Washington which before planting in 1900 was bought for £20 an acre was, with apple-trees and irrigation ditches, valued at £400 or more. Few apples were exported from the north-west of the United States till 1900. British Columbia was

some eight or ten years later than Oregon and Washington in fully establishing its claims to rank beside them; see COLUMBIA (BRITISH).

The apple figures largely in Greek and Scandinavian mythology. Abela in Campania may take its name from the apple, for which it was famous (*Æneid*, vii. 740); and Apollo, according to some, is from the same root (*p* for *b* may point to an Illyrian source). See also ATALANTA, HESPERIDES, PARIS. The traditional 'apple' of Eden (see ADAM AND EVE) need not be identified with our apple (Tristram made it an apicot).

See FRUIT, GARDENING, ORCHARD, PLANTS (DISEASES OF), AMERICAN BLIGHT, and for the Crabs, CRAB-APPLE; De Candolle's *Origin of Cultivated Plants* (1872); and the special manuals such as Thomas's *Book of the Apple* (1902), Bailey's *Apple Culture* (1905), Bealby's *Fruit Raising in British Columbia* (1909).

Appleby, the county town of Westmoreland, on the Eden, 13 miles S.E. of Penrith. There is a castle, first mentioned in 1088, the keep of which, called Caesar's Tower, is still in tolerable condition. Appleby was disfranchised by the Reform Bill of 1832, but it received a new municipal charter in 1885. Its trade depends on the agricultural district around, and it is a holiday-resort. Pop. 1800.

Apple of Sodom. See SOLANUM.

Appleton, a city of Wisconsin, U.S., 185 miles N. of Chicago, and 120 miles from Milwaukee by rail. It is noteworthy chiefly from its situation on the Grand Chute Rapids of the Fox River, which, with a descent of 30 feet in 1½ mile, affords immense water-power for flour, paper, and woollen mills. There are also manufactures of machinery. The city is the seat of Lawrence College (interdenominational). Pop. 20,000.

Appleton, CHARLES EDWARD, D.C.L., was born at Reading, 16th March 1841, and was educated at Oxford and in Germany. His reading was wide and varied, but he wrote little. He took a lively interest in the movement for the 'endowment of research,' and he founded in 1869 the *Academy*, whose special feature is its signed articles. He died at Luxor, in Upper Egypt, in 1879. See his *Life and Literary Relics*, by J. H. Appleton and A. H. Sayce (1881).

Appleton, DANIEL (1785-1849), the founder of the American publishing house of D. Appleton & Co., was born at Haverhill, Mass., where he commenced business as a retail trader. Removing to Boston, he afterwards settled as a bookseller in New York, and gradually built up one of the largest businesses of its kind in the United States. He retired in 1848 in favour of his three sons, of whom the last died in 1878. The success of the firm justified it in beginning, previous to 1857, the *New American Cyclopaedia*, under the editorship of George Ripley and Charles A. Dana, which was completed in 1863, in sixteen volumes, at a cost of £100,000. A new edition was published in 1872-76. The same firm has issued many scientific and educational works.

Appogiatura ('leaning note'), an Italian musical term, designating a form of embellishment by insertion of notes of passage in a melody. The appoggiatura notes are printed in a smaller character than the leading notes of the melody, and should always be given with considerable expression. There are two species, the long and the short. The former is now seldom printed, the music being written as played; the latter is usually termed an *Acciacatura*, and written with a short stroke across the stem of the note. The appoggiatura proper takes half its length from the note it precedes, except when preceding a dotted note, from which it takes a third. The following is an example:

Written.

Played.

Appointment. In a deed or will, power is often given or reserved to a certain person to appoint the uses to which property may be applied. Thus, a marriage settlement may contain a power of appointment, enabling the wife to distribute her property among the children of the marriage at her own discretion. The appointment when it is made derives its force, and the party in whose favour it is made derives his title, from the instrument in which the power of appointment is contained. The Courts of Equity give relief against a defective appointment, or defective execution of a power, where there is what is called a 'meritorious consideration' in the person applying for such relief. As to what amounts to such meritorious consideration, Lord St Leonards, in his work on Powers, lays down that equity will relieve the following parties: (1) A purchaser, including in such term a mortgagee and lessee; (2) A creditor; (3) A wife; (4) A legitimate child; and (5) A charity. But in the case of a defective appointment by a wife in favour of her husband, there is no relief in equity; nor is the equity extended to a natural child; nor to a grandchild; nor to a father or mother, or brother or sister, even of the whole blood, much less of the half-blood; nor to a nephew or cousin. Against the legal consequences of an appointment, the Courts of Equity give no aid. See **POWER**.

In the Scots law, the expressions *reserved power, faculty to burden, and faculty of distribution*, correspond to the English phrase 'power of appointment'; and the deed or instrument subsequently executed in virtue of the reserved power, is simply described according to the nature and quality of the conveyance so made; but the term *appointment* is not a technical word in Scotland.

Appomattox Courthouse, a village of Virginia, 20 miles E. of Lynchburg. Here General Lee, on April 9, 1865, surrendered the army of Northern Virginia, 27,805 men strong, to General Grant.

Apportionment may be stated to be this—that in the event of the termination of a life-interest by death, or of a more limited interest at a fixed period, the current rent or income shall be apportioned or paid over in such a way as to give the personal representatives of the party, or the party himself, as the case may be, a sum corresponding to the period that may have elapsed between the last date of payment and the death or other determination of the interest or estate. This was the effect of the Apportionment Act, 1834, which applied to the whole United Kingdom. It dealt chiefly with the cases of heirs of entail, liferenters, &c. The Apportionment Act of 1870 extends the principle to all rents, annuities, salaries, pensions, dividends, and other periodical payments, in the nature of income, so that all these now, like interest on money lent, are considered as accruing from day to day and are apportionable. When a person, therefore, dies, the income accruing up to the day of death is payable at the next term of payment to the executor of the deceased. In the case of rents, however, he must recover the proportion, not from the tenant liable for the whole payment, but from the heir (i.e. the new landlord) who receives it. Annual sums payable under policies of insurance are not apportionable by virtue of the statute.

The word apportion is also used technically in English law to indicate (1) that a contract is divisible, so that a party may sue on one obligation, although he may not have performed all his obligations; (2) that a common of pasture may be divided proportionally among the owners of the common to which the pasture is attached.

Apposition, a term in Grammar signifying the annexing of one substantive to another, in the same case or relation, in order to explain or limit the first; as, *My brother, the physician; Thomas the Rhymist*. Whole sentences or clauses admit of apposition; thus, 'Napoleon sought the way to India through Russia—a stroke of genius.' Sometimes a connecting word is used where logical propriety would require apposition; as, *the city of Bristol, for the city Bristol*.

Appraisement. An appraisement signifies generally any valuation of property; but in England the term is also used technically to denote a valuation by two sworn appraisers under a distress for rent. Where the value of the appraisement does not exceed £5, a stamp of threepence is required, and if over £500, the duty is £1; between these amounts *ad valorem* stamp-duties from sixpence to fifteen shillings are exigible. Appraisements are exempted from duty if they are made (1) For the information of one party only; (2) In pursuance of the order of any Admiralty Court, or Court of Appeal therefrom; (3) For the purpose of ascertaining legacy, succession, or inventory duties; (4) With reference to the property of a bankrupt; (5) For Income-tax purposes.

An appraiser is a person licensed to make appraisements or valuations. The cost of the annual license is £2, but licensed auctioneers and attorneys require no special license. The appraiser is bound to write out the appraisement on duly stamped paper under a penalty of £50, and any person receiving or paying for an unstamped appraisement is liable to forfeit £20.

Apprehend. See **ARREST**.

Apprentice is a person described in law-books as a species of servant, and called apprentice, from the French verb *apprendre*, 'to learn,' because he is bound by indenture to serve a master for a certain term, receiving in return for his services instruction in his master's profession, art, or trade; the master, upon the other hand, contracting to instruct the apprentice, and, according to the nature of the agreement, to provide food and clothing for the apprentice, and to pay him small wages. The system of apprentices was incidental to the old craft guilds. Only apprentices were admitted to the freedom of the craft, and thus not only was monopoly secured, but a valuable organisation of the trade. In England the system was widespread and important, both in the early history of trade and from its later connection with the English poor-law system, under which apprenticeship gave a right of settlement. In Scotland the system never had the same importance, and now, except in one branch of the legal profession, apprenticeship is voluntary. By a provision of the 5 Eliz. chap. 4, it was in general required that every person exercising a trade in England should have previously served as apprentice to it for seven years; but by later statutes, that provision was abolished, with a saving of the customs and by-laws in London and other corporations; and the term of apprenticeship is now determined by the mutual convenience of the contracting parties. By the Municipal Corporation Act, 1834, all such customs and by-laws as had the effect of prohibiting trades and occupations to persons who had not served as apprentices were also abolished. But in many trades the modern unions still practically enforce a law restricting the

number of apprentices, &c., and prohibiting the employment of those who have not served as apprentices. Apprentices, in general, are bound out by their friends, though with their own consent, testified by their executing the indentures, without which the transaction is not binding. The rule of the Scots law is that, where the apprentice is a pupil, his father or tutor signs the indenture. An apprentice, on the other hand, who has passed the years of pupillage may effectually enter into an indenture by which he will be personally bound. But the minor's father, if alive, or his curator, if he has a curator, should consent and concur in the indenture. It has been decided in England that the express assent of an infant apprentice to the indentures is essential to the contract. As a rule writing is essential, and a cautioner or surety is generally required. Under the Stamp Acts the indenture is void if the full consideration is not set forth.

The apprentice is bound to enter the service and continue in it; and even after enlistment in the army, the apprentice, if under the age of twenty-one, may be reclaimed by the master by a proceeding before a justice of the peace. The master has also an action against any one who entices away an apprentice. The apprentice must be obedient, diligent, respectful towards his master, and must behave decently and honestly; but the misconduct must be gross to justify dismissal. The master, on the other hand, must teach the apprentice his whole art and mystery. He must treat him properly, and provide him with medical attendance and medicine in sickness. He cannot assign the apprentice to another. The term 'workman' in the Workmen's Compensation Act, 1906, includes an apprentice. See COMPENSATION, LIABILITY OF EMPLOYERS.

There is a special class of apprentices in England who are bound out by the guardians of the poor, and are called *parish apprentices*. Formerly the children of poor persons might, even without becoming parties to the indentures, be apprenticed out by the overseers with the consent of two justices (now by the guardians, without such consent), till twenty-one years of age, to suitable persons; and such persons might till 1844 be compelled to take them. But the reception of any poor child as an apprentice is no longer compulsory. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained. This is under the control of the Ministry of Health, who make new rules from time to time, as they may think fit; and the justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures, upon reasonable cause shown. See FACTORY ACTS.

An apprentice's indenture is terminable by the consent of all the parties to it; and also by the death of the master, or of a partner of the employing firm. In such cases a portion of the fee is generally returnable. On the death of the apprentice, however, the fee is not returnable. But the executor of the master may bind the apprentice to another master if the contract so provide; and he must also discharge any covenant or agreement for the apprentice's maintenance, so far as he has assets. By the custom of London, if the master of an apprentice die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the apprentice to another master of the same trade. The bankruptcy of the master operates as a discharge of the indenture of the apprentice, who, if he has paid an apprentice fee to the bankrupt, is entitled to be paid by the court a reasonable sum out of the estate. Apprentices not paying premium,

and whose premium was less than £25, are in general subject to the provisions of the Employers' and Workmen's Act, 1875—i.e. a court of summary jurisdiction may order the apprentice to perform his duties, and in default imprison him; may cancel the indenture and order repayment of premium; and may award damages up to £10 against either party or the cautioner.

By the Army Act, apprentices enlisting in the army, and concealing their apprenticeship when brought before a magistrate to be attested, may be indicted for obtaining money under *false pretences*; and if, after the expiration of their apprenticeship, they do not surrender to a recruiting officer, they may be apprehended as deserters.

Apprentices to the sea service are governed by the provisions of the Merchant Shipping Acts. Superintendents of mercantile marine shall give to boards of guardians, overseers, and others, all assistance in their power for facilitating the apprenticing of boys under their charge to the sea service. In the case of boys bound by guardians of the poor, the indentures must be executed in presence of two justices, who shall see that the boy has attained 12 years of age, has consented to be bound, that he is of sufficient health and strength, and that the master is a proper person for the purpose. See MASTER AND SERVANT; Reginald Bray's *Boy Labour and Apprenticeship* (1911); Dunlop and Denman, *English Apprenticeship and Child Labour* (1912).

The practice of trade-unions above referred to lowered the standard of skilled labour in many trades, and the National Institution of Apprenticeship, London (with some help from the Charity Commissioners), is endeavouring to improve matters.

In the United States the system of apprenticeship has largely become obsolete; little account is taken of indentures and the serving of time.

Approbate and Reprobate, a technical expression in the law of Scotland, which means that no one can be permitted to accept and reject (*approbare and reprobare*) the same deed or instrument. The most frequent occasion for the application of the doctrine arises where the will of a testator confers benefits on his wife and children and at the same time directs a distribution of his estate, which, expressly or by clear implication, is inconsistent with his wife or children taking their indefeasible 'legal rights' under the Scots law of succession. In these circumstances they must choose whether they will accept the benefits conferred on them by the will or stand by their 'legal rights.' They cannot 'approve' the will by accepting the benefits and 'reprobate' it by claiming their legal rights, and so *pro tanto* frustrating the distribution of the estate directed in the will. They are, in fact, put to an 'election.' The doctrine is, it is now settled, identical with that of election in English law. Where, however, the will does not indicate a clear intention that the taking of their legal rights by the wife or children shall involve a total forfeiture of the testamentary benefits, there comes into operation the principle of 'equitable compensation.' Under this principle, the wife or children who have elected to take their legal rights are excluded from the testamentary provisions in their favour only to the extent necessary to compensate the other beneficiaries whose interests have been prejudiced by that election.

Appropriation is the opposite of expropriation, and means making something the property of a particular person—e.g. game, which is the property of no one, is appropriated by capture; or one man is said to appropriate the ideas of another. The word has various important applications in law. (1) Where so much iron or oil, for

instance, has been sold, but the quantity is not separated by weight or measurement from a larger mass; or where a certain proportion is sold, but the exact quantity or price is not known until measurement, &c; in such cases the risk of the goods perishing and the ownership do not pass to the buyer. Before delivery, however, the goods may be 'appropriated' to the contract so as to produce this effect. (2) When a bill is drawn against goods, and the bill of lading is sent as a security to the acceptor, the goods are said to be appropriated to the payment of the bill. (3) Where several debts are due to the same creditor, the debtor, in making a payment, may appropriate it to a particular debt. If he does not do so, the creditor may apply it as he pleases—e.g. to the least secured debt, or to interest instead of principal. Where the parties say nothing, the law appropriates the payments in order of date. Thus, in a banking account, the first item on the credit side is applied to the first item on the debit side, and so on. In church law, an appropriator is the owner of a benefice—e.g. the lay rector who receives the tithes, but is bound to appoint a vicar or perpetual curate for the spiritual service of the parish. In constitutional law, appropriation means the principle that 'supplies granted by parliament are only to be expended for particular objects specified by itself.' This principle was acted on by the Commons during the Commonwealth, was definitely established during the Dutch war of 1665, and since the reign of William III. has been expressed in the Annual Appropriation Act by a clause prohibiting the treasury officials from applying public money to any service other than that to which it has been specially appropriated. The appropriation of a benefice meant the transference of its tithes and endowments to a religious house or other corporation.

Appropriation Act is an act, passed at the end of each session of parliament, summing up and ratifying all the resolutions as to expenditure adopted by the House of Commons during the session. The bill, which is brought in by the Committee of Ways and Means, authorises the Treasury to issue out of the Consolidated Fund the balance of money required for expenditure in addition to the votes on account, gives authority to borrow either on Treasury bills payable during the financial year or otherwise for short periods, and 'appropriates' the money granted by the bill itself as well as by the votes on account. Upon the second reading of the bill in the House of Commons, it is customary to have a general debate on any subject in relation to which money is granted. The bill is formally agreed to by the House of Lords.

Approver, or **PROVER**, in the law of England, is a person who has been an accomplice in the perpetration of a crime, but who is admitted to give evidence against the prisoner. Formerly it was applied to one guilty of treason or felony who confessed on the promise of a pardon, conditional on the conviction of those whom he implicated.

The modern practice is to admit accomplices to give evidence for the prosecution, or, as it is said, to turn *King's evidence*, upon an implied promise of pardon, on condition of their making a full and fair confession of the whole truth. This assurance is generally given by the committing magistrate. The admission, however, of an accomplice to give evidence against his fellows at the trial requires the sanction of the judge presiding at the trial, and such sanction is not given unless the evidence appears to be necessary to secure a conviction and likely to be corroborated. The testimony of an accomplice is in all cases, however,

regarded with just suspicion; and unless his statement is corroborated in some material part by unimpeachable evidence, the jury are usually advised by the judge to acquit the prisoner; and if the accomplice, after having confessed the crime, and being admitted as King's evidence, does not satisfy the condition on which he was so received by failing to give full information without equivocation, reservation, or fraud, he then forfeits all claim to protection, and may be tried, convicted, and punished on his own confession. The practice, however, is to direct an acquittal before the accomplice is examined, if he has been joined in the indictment.

The term in the law of Scotland analogous to that of approver is *socius criminis*, and the principles on which the *socius* is admitted, and on which his evidence is left to the jury, are the same as in England. But the criminal courts in Scotland give absolute protection to the *socius* who has been examined, after proper warning from the judge that what he says cannot be used against him. This privilege is altogether independent of the prevarication or unwillingness with which the witness may give his testimony. Justice, indeed, may often be defeated by a witness retracting his previous disclosures, or refusing to make any confession after he is put into the box; but it would be much more put in hazard if the witness was sensible that his future safety depended upon the extent to which he spoke out against his associate at the bar. The only remedy, therefore, in such a case is committal of the witness for contempt or prevarication, or indicting him for perjury, if there are sufficient grounds for any of these proceedings.

Approximation, a term commonly used in mathematical science to designate such calculations as are not rigorously correct, but approach the truth near enough for a given purpose. Thus in logarithmic and trigonometrical tables nearly all the numbers are mere approximations to the truth. The calculations of astronomy generally are of this nature. Even in pure mathematics there are parts in which approaches to the truth, by means of interminable series, are all we are able to gain. The solution of equations beyond the fourth degree can be got only by approximation.

Appuleius. See **APULEIUS**.

Appulia. See **APULIA**.

Appun, KARL FERDINAND (1820-72), naturalist, born at Bunzlau, travelled for many years in Venezuela, British Guiana, and Brazil. He wrote *Unter den Tropen* (1871).

Apraxin, FEODOR, COUNT, creator of the Russian navy and court favourite, was born in 1671. Entering the navy, he rapidly rose to be admiral. In 1708 he defeated the Swedes; in 1710 he captured Viborg, in Finland; and in 1711 commanded in the Black Sea during the Turkish war. Again, in 1713, he conducted the war with Sweden so successfully that Russia was confirmed in her possession of Finland, just conquered, and of Esthonia. In 1714, however, and again in 1718, he was charged with responsibility in connection with embezzlement, tried, and condemned to pay a fine; but in spite of this and his opposition to many of Peter's reforms, his services were too useful to be dispensed with. In 1722 he accompanied Peter in his Persian war. He died in 1728.

Apricot (*Prunus armeniaca*), a species of the same genus with the Plum (q.v.), is a native of Caucasia, and is cultivated throughout Asia, Europe, and America. It is a small tree of from 15 to 30 feet high, with ovate, acuminate, and cordate, smooth, doubly-toothed leaves on long stalks; solitary, sessile, white flowers which appear before the leaves, and fruit resembling the peach, roundish, downy, yellow, and ruddy on the side next the sun,

with yellow flesh. The apricot was brought into Europe in the time of Alexander the Great, and since the days of the Romans has been diffused over all its western countries. It has been cultivated in England since the middle of the 16th

Apricot (*Prunus armeniaca*).

century. It is only in the south of England that it is ever trained as a standard, nor is it grown in the more northern parts even as an espalier, but almost always as a wall-tree. More than twenty kinds are distinguished, amongst which some excel very much in size, fine colour, sweetness, and abundance of juice. The finest varieties in Britain are the *Moor Park*, *Royal*, *Frogmore Early*, *Large Early*, *Turkey*, and *Powell's Late*, which all ripen between mid-August and mid-September, and which are generally budded on plum or wild cherry stocks. The fruit keeps only for a very short time, and is either eaten fresh, or made into a preserve or jelly. Apricots split up, having the stone taken out, and dried, are largely exported from Italy (Trieste, Genoa, Leghorn) and from the south of France, and also after being preserved and candied. They are also imported through Afghanistan into northern India. Dried apricots from Bokhara are sold in the towns of Russia, the kernels of which are perfectly sweet, like those of the sweet almond. The kernels are sweet in some kinds, and bitter in others—the bitterness being probably more natural, and the sweetness, as in the almond, the result of cultivation. Generally speaking, they may be used for the same purposes as almonds. From the bitter kernels, which contain Prussic acid, the *Eau de noyau* is distilled in France. The charred stones yield a black pigment similar to Indian ink. The wood of the tree is good only for the purposes of the turner.

The Briançon Apricot (*P. brigantia*) very much resembles the common apricot. The fruit is glabrous. It is found in Dauphiné and Piedmont. At Briançon, an oil, called *Huile de marmotte*, is expressed from the seeds. The Siberian Apricot (*P. sibirica*) is also very like the common apricot, but smaller in all its parts. The fruit is small. It is a native of Siberia, especially of the southern slopes of the mountains of Dahuria. The Apricot Plum is, as the name implies, not an apricot. It is an excellent kind of plum, which, in some parts of France, is preserved in sugar, dried, and extensively exported.

The older form of the name, *apricock*, best shows the descent of the word through Portuguese *albricoque*, Arab. *al* (the) *barqûq*, and late Gr. *praikokion*, from Lat. *præcoquus*, *præcox*, 'early ripe.'

April. The Romans gave this month the name of *Aprilis*, derived from *aperire*, 'to open,' probably

because it is the season when the buds begin to open; by the Anglo-Saxons it was called *Easter-month*. The custom of sending one upon a bootless errand on the first day of this month, has been supposed to be a travesty of the sending hither and thither of the Saviour from Annas to Caiaphas, and from Pilate to Herod, because during the middle ages this scene in Christ's life was made the subject of a Miracle-play (q.v.) at Easter, which usually occurs in April. It is more probable that it is a relic of some old heathen Celtic festival. The custom, whatever be its origin, of playing off little tricks on this day, whereby ridicule may be fixed upon unguarded individuals, appears to be universal throughout Europe. It is believed that both England and Germany derived the custom from France. In France, one thus imposed upon is called *un poisson d'avril* (an April fish). In England such a person is called an April fool; in Scotland, a gowk. Gowk is the Scots for the cuckoo, and also signifies a foolish person. The favourite jest in Britain is to send one upon an errand for something grossly nonsensical; or to make appointments which are not to be kept; or to call to a passer-by that there is a spot of mud upon his face, or the like. When he falls into the snare, the term April fool or gowk is applied with a shout of laughter.

A priori. *A priori* reasoning, in Kant's use of the term, is that which rests on general notions or ideas, and is independent of experience; which is derived from the constitution of the mind, and is accordingly prior to all experience. But the word is used loosely in various senses; sometimes for reasoning from a general principle to its consequences; sometimes from observed facts to another fact or principle not observed; still more loosely for arguing from pre-existing knowledge, or even from cherished prejudices ('innate ideas' would be *a priori*). The Aristotelian usage made *a priori* reasoning from cause to effect; *a posteriori* from effect to cause. Now usually, reasoning from experience is called *a posteriori* reasoning. A predilection for one or the other of these forms of reasoning forms one of the most important distinctions among schools of philosophy. Plato and most of the great Germans may be taken as typical of the *a priori* school, Bacon and Locke of the empirical or experimental. *A priori* philosophy claims for its conclusions the character of necessary truths, and denies that there can be a *posteriori* proof of anything, that kind of reasoning furnishing only a confirmation or verification. The opposite school maintain that the general notions or principles on which *a priori* reasoning rests are themselves the results of experience, and that, therefore, all truth rests really on a *posteriori* grounds. Synthetic and analytic, deductive and inductive, correspond in a general way to a *priori* and a *posteriori*. See ANALYSIS, DEDUCTION, INDUCTION, LOGIC, TRANSCENDENTALISM.

Apse (Lat. *apsis*), a semicircular or semi-oval recess usually placed at the east end of the choir or chancel of all early churches, up to and including those of the Romanesque and Norman styles. The origin of this peculiar termination to the choir is generally supposed to be as follows. It is believed that the heathen structure from which the early Christians borrowed the form of their churches, was not the temple but the Basilica or public hall, which served at once for a marketplace and a court of justice. The Basilica was generally a parallelogram, at one of the shorter sides of which, opposite to the entrance, there was a raised platform destined for the accommodation of the persons engaged in, and connected with, the distribution of justice. This portion of the

building was the prototype of the rounded choir, to which the name of apse was given. For the prætor's chair, which was placed in the centre of this semicircular space, the bishop's seat was substituted. This theory has, however, been disputed; Professor Baldwin Brown, of Edinburgh, maintaining that the apse was common to the *schola*,

The Church of the Apostles, Cologne.
(From a Photograph.)

or meeting-room, of the Christian and other guilds under the Roman empire, and contained the seat of the president (see *From Schola to Cathedral*, 1886). ApSES are to be met with in many English churches; but the structure is not only much more frequent, but continued to be used to a much later period on the Continent, and it may still be seen in almost every little village along the banks of the Rhine, and in the older churches of France and Italy. The lower part of the apse is usually pierced by two or three round arched windows, over which there is frequently an external arcaded gallery supported by small shafts; and the whole is joined to the end of the choir, which rises considerably above it, by a roof in the form of the segment of a cone. These features are all distinctly visible in the annexed illustration of the east end of the Church of the Apostles at Cologne, which is a typical example of Rhenish architecture. In this instance the transepts, as well as the choir, are terminated with round apses, thus producing a triapsal arrangement, similar to many churches in the East. The semicircular form of apse is of Roman origin, but many apses, especially in the south of France, are octagonal—a shape indicating a Byzantine influence. From 1100, some churches in Auvergne and the west of France began to adopt an aisle round the apse, and chapels were gradually introduced radiating from the aisle. These were ultimately developed in the 13th century into the splendid *chevets* of the great French cathedrals, such as Amiens and Beauvais. In Germany, numerous instances occur of churches with an apse at both the east and west ends. A few specimens are also found in the 2nd of

France. The western apse is supposed to represent the baptistery, which was originally a separate round building, but was afterwards absorbed into the main edifice in this form. Several examples of the apse are to be seen in the earlier ecclesiastical structures of Scotland; as instances, we may mention the churches of Dalmeny and Leuchars.

Apscheron, a peninsula on the west coast of the Caspian Sea, belonging to the republic of Azerbaijan. It is interesting for its volcanic condition, its burning naphtha wells, and its mud volcanoes. Its enormous petroleum industry is described at Baku (q.v.).

Ap'sides (Gr. *apsis*, 'connection'), the two extreme points in the orbit of a planet—one at the greatest, the other at the least distance from the sun. The term apses is also applied in the same manner to the two points in the orbit of a satellite—one nearest to, the other farthest from, its primary; corresponding, in the case of the moon, to the perigee and apogee. A right line connecting these extreme points is called the line of apses. In all the planetary orbits, this line has no fixed position in space, but makes a forward motion in the plane of the orbit, except in the case of the planet Venus, where the motion is retrograding. This fact in the orbit of the earth gives rise to the Anomalistic Year (q.v.). This advancing motion of the line of apses is especially remarkable in the orbit of the moon, where it amounts to $40^{\circ} 40' 32''$ annually, an entire revolution thus taking place in rather less than nine years. See MOON, PERTURBATIONS.

Apt (*Apta Julia*), a town in the French department of Vaucluse, 30 miles E. of Avignon. The cathedral dates from the 11th century, and parts of it from the 9th or 10th. There are Roman remains in and near the town. Pop. 5000.

Apterous Insects are insects without wings. In the Linnean system, the Aptera formed a distinct order of insects, and included a large number of incongruous forms. Many of these have been distributed to other orders, and the remainder—e.g. Collembola and Thysanura, are regarded as survivors of primitive forms. The term is now rarely used except as a descriptive adjective, equivalent to wingless. See INSECTS.

Apteryx (Gr. *a*, 'without,' *pteryx*, 'wing'), or KIWI, a genus of New Zealand birds, belonging to the sub-class Ratitæ, in which the breastbone has no keel. It is thus allied to the ostrich-like birds.

Apteryx.

It is usually about the size of a large hen, but some measure two feet or more in height. The colour is reddish-brown or gray. Though incapable of flight, it is not really wingless; the rudimentary stump,

with short humerus and one complete digit, is merely hidden by the downy feathers which thickly cover the body. The barbs of the feathers are not united, and there is no aftershaft (see FEATHER). The short, scale-covered legs are strong, and enable the bird to avoid its enemies by rapid running. The three anterior toes are armed with strong claws, used in scratching and as weapons, while the posterior fourth toe is short and raised from the ground. The long, slender, rounded beak, with the nostrils at its tip, is largely used for pulling worms out of the ground. The bones of the body do not exhibit the usual air-cavities found in flying birds. The apteryx lies during the day in holes in the ground, or at the foot of trees, and comes out in the twilight. They feed on worms, grubs, and also 'hinau berries.' They make a peculiar snuffing noise when hunting or feeding. They live in pairs, and the female lays, apparently twice a year, a very large egg, which is deposited in a hole at the foot of a tree or tree-fern. The male takes some share at least in the labour of incubation. Four species have been distinguished, two in North Island and two in South Island of New Zealand. It is somewhat uncertain whether they are really distinct.

Aptornis, a genus of extinct Rallidæ whose remains are found in New Zealand with those of the Moa; see NOTORNIS.

Apuleius, or **APPULEIUS**, a Latin satirist of the 2d century, was born at Madaura, in Africa, where his father was a magistrate and a man of large fortune. Apuleius studied first at Carthage, and afterwards at Athens, displaying a special predilection for the Platonic philosophy. He visited Italy, Asia, &c., and was initiated into numerous religious mysteries. The knowledge thus acquired of the priestly fraternities he made abundant use of afterwards in his *Metamorphoses*, better known as *The Golden Ass*. Having married a wealthy middle-aged lady, he was charged by her relations with having employed magic to gain her affections. His *Apologia*, still extant, was an eloquent and successful vindication of his conduct. Henceforward his life appears to have been devoted zealously to literature and public oratory, in both of which he attained great eminence. The *Golden Ass*, the work by which his reputation has survived, is a romance, which is generally understood to have been intended as a satire on the vices of the age, especially those of the priesthood, and of quacks or jugglers affecting supernatural powers, though Bishop Warburton fancied he could detect in it an indirect apology for paganism. Its merits are great and conspicuous, as are also its faults. Wit, humour, satire, fancy, learning, and even poetic eloquence abound, but the style is disfigured by excessive archaisms and by a frequent affectation in the metaphors. The most exquisite thing in the whole work is the episode of Cupid and Psyche. We have also from the pen of Apuleius an *Anthology*, a work on the *Dæmon* of Socrates, one on the doctrines of Plato, &c.

Adlington's translation (1566) of the *Golden Ass* was republished by Whibley in 1893 and Seacombe in 1915. There are also translations by Taylor (1822), Sir G. Head (1851), F. D. Byrne (1904), and H. E. Butler (1909-10). Apuleius was edited by Van de Vliet (*Metamorphoses*, 1897; *Apologia* and *Florida*, 1900). And see Furser's edition of the Cupid and Psyche episode (1910).

Apulia (modern *Puglia*), the south-eastern part of Italy as far as the promontory of Leuca, comprising the three provinces of Bari, Foggia, and Lecce, with an area of 8540 sq. m., and a pop. (1921) of 2,297,061. In ancient times it extended from the river Fiento to the promontory Iapygium, and was bounded on the west by Samnium and Lucania, on the north by

the Frentani. More strictly defined, it was the country east of Samnium, on both sides of the Aufidus—the Daunian and Peucetia of the Greeks. The latter frequently applied the name Iapygia to include all Apulia. The inhabitants of Apulia formed three distinct peoples—the Messapians or Salentini, the Peucetii, and the Dauni or Apulians. Its principal cities were Arpi, Luceria, and Canusium. They first appear in history as concluding a treaty with the Romans, in 326 B.C., against the Samnites; but this they soon after repudiated, and in 317 all the Apulian cities submitted to Rome. The second Punic war was for some time carried on in this province, the battle of Cannæ (216 B.C.) being fought within its borders, and many of its cities were severely punished by the Romans for siding with Hannibal. A like fate overtook them at the close of the social war in 89 B.C., and the district has never since recovered its ancient wealth and prosperity. It is but a shadow of its former self in the time of the Greek colonies, under Roman dominion, or even under the Normans, who made a duchy of it in 1043 A.D. Most of the towns are depopulated, and agriculture is in a very low condition. See Gregorovius's *Apulische Landschaften* (4th ed. 1897).

Apurê, a navigable river of Venezuela, which rises near the western boundary among the Eastern Cordillera, and flows nearly 1000 miles eastward, past the towns of Nutrias and San Fernando, till it falls by six arms into the Orinoco.

Apu'rimac, a river of Peru, also called *Tambo*, which, after a northward course of 500 miles, helps to form the Ucayali, and finally joins the Amazon, of which it is one of the most southerly tributaries. It gives name to a province of Peru, with an area of 8200 sq. miles, and a population of over 170,000.

Aqua Fortis (literally 'strong water') was the term used by the alchemists to denote nitric acid, and is still the commercial name of that acid.

Aquamarine, a name sometimes popularly given to the Beryl (q.v.), as being 'sea-coloured.' Some green and blue varieties of topaz have also been so styled.

Aqua Regi'ne (literally 'queen's water') is a mixture of concentrated sulphuric acid (oil of vitriol) and nitric acid, or of sulphuric acid and nitre. Either mixture evolves fumes largely, and may be used as a disinfectant.

Aqua Regis, or **REGIA** (literally 'royal water'), is the common name applied to a mixture of 1 part of nitric acid, and 2, 3, or 4 parts of hydrochloric acid. The general proportion is 1 to 2. The term aqua regia was given to the mixture from the power it possesses of dissolving gold, which is the *king of the metals*.

Aquarium, some contrivance on a large or small scale for keeping aquatic animals and plants alive out of their native habitat. Though the custom of keeping fish alive in tanks (*vivaria*) had been for long resorted to as a matter of domestic convenience, it is only since the middle of this century that the scientific and æsthetic value of aquariums has been appreciated. The Scottish naturalist Sir John Dalyell was one of the first (from 1790 onwards) to utilise simple aquariums for scientific purposes, and the almost historic long-lived sea-anemone 'Grannie' was one of his prisoners. In 1842 Johnston described the successful establishment of a small but well-peopled aquarium. Ward, Gosse, Warrington, and others did much to make both fresh-water and marine collections practicable and popular, and though the fresh enthusiasm that they called forth has to some extent died away, the number of public

and scientific aquariums has greatly increased. The large aquariums at Brighton and Hamburg are deservedly famous, and many others have been established both in towns for popular instruction and at the various zoological marine stations for purposes of scientific study. The first scientific and popular aquarium was that erected in the London Zoological Gardens in 1852. The Berlin Aquarium is a good instance of a well managed collection at a considerable distance from the sea, while that in connection with the Naples Zoological Station has proved a most valuable acquisition in studying the habits and life-histories of marine plants and animals. For detailed information, the reports of the Brighton Aquarium and the Naples station should be consulted.

Fresh-water aquariums, though less decorative and interesting, are on some scale possible to every one, while the ready importation of sea-water or its artificial preparation makes it quite feasible for even inland residents to keep marine plants or animals in good condition. Since 1841 various recipes have been given for the artificial preparation of sea-water—e.g. by mixing with rather less than 4 quarts of spring-water $3\frac{1}{2}$ ounces of common table-salt, $\frac{1}{2}$ ounce Epsom salts, 200 grains of chloride of magnesium, and 40 grains of chloride of potassium. Into this sea-lettuce (*Ulva*) and other seaweeds should first be placed. For a successful aquarium careful aeration is essential; and this is effected either simply by the aid of a syringe, or by mechanical contrivances of fountain, drip-glass, &c., and as far as possible also by regulating the proportion of plants and animals, since these compensate one another in their relations to the atmosphere. Abundant light and careful purification are also necessary. Dead specimens must be removed before decomposition, and the water filtered when it shows signs of losing its clearness and fresh smell. Concentration of the sea-water through evaporation, original impurities in the water (which is best conveyed in fir-wood or stoneware vessels), contamination by dust, overcrowding, and the like, must obviously be avoided. As to the stock, experience is the surest though slowest guide; but hints can be obtained by consulting popular works on marine plants and animals—P. H. Gosse's *Aquarium* (1854), and more modern works, such as that of Hughes. Kingsley's *Glaucus* is also of permanent interest to beginners.

Aquarius ('the Water-bearer'), the eleventh sign of the zodiac, through which the sun moves in part of the months of January and February. See ZODIAC.

Aquatic Animals. Apart from any speculations as to the more or less watery nook where the first forms of life were cradled, it is worth noting that the home of almost all the simpler animals is distinctly and necessarily aquatic. While a few of the Protozoa, such as one of the Amœbæ, occur in damp places on land, or within other organisms, the vast majority live freely in the water, and the same is true of the Sponges, Coelenterates, and Echinoderms. Among worms, however, more emphatic exceptions occur, such as the earthworm, where the structure and habit of the animal has become distinctly adapted to terrestrial life. While the great majority of crustaceans again are aquatic, a few, such as the wood-louse and the land-crab, are modified for life ashore. The crowd of insects, spiders, and myriapods are of course terrestrial or aerial, though here also the habits of some adult forms, and the life of some of the young, are distinctly aquatic. Among molluscs also there is an equally familiar occurrence of both aquatic and terrestrial habit, while numerous forms illustrate

the transition from the former to the latter. The ascidians are exclusively marine. Some fishes have a limited power of life out of the water, the double-breathing Dipnoi (q.v.) being in this connection especially instructive. Among many amphibians, the transition from water to terra-firma is seen in the individual life-history, when the fish-like gilled tadpole becomes the lunged gill-less frog; while in a few exceptional cases, such as the black salamander of the Alps, the life is terrestrial from first to last, and even the young dispense with their preliminary swim as tadpoles, although a brief recapitulation of their aquatic life is still represented by a gilled stage within the body of the parent. The instance of the gilled Axolotl (q.v.) becoming, in the absence of sufficient water, the gill-less Amblystoma, forcibly illustrates the importance of the medium as a factor in evolution. Among reptiles there are numerous aquatic forms—chelonians, lizards, snakes, and crocodiles, though the absence of any gill-respiration marks the progressive general adaptation to terrestrial life. While an emphatically terrestrial amphibian like the tree-frog seeks a watery hole for the rearing of the young gill-breathing tadpoles, the habit is reversed in such reptiles as the sea-turtle, which having returned to the more primitive aquatic home, yet revisits the land for egg-laying purposes. The cradle of the young in both cases indicates the ancestral habit of the parent. Among the emphatically aerial birds, there are cases like that of the penguin, where the structure has become adapted to an almost exclusively aquatic life. And so among mammals, the sea-cow, the seal, and the whale are familiar illustrations of very different types which have returned to the primeval watery home and aquatic habit, with consequent change of structure.

To sum up the adaptations to aquatic life would obviously be to attempt to compress a large department of comparative physiology. It is more important simply to note the general fact that, in the water, animals are subjected to influences somewhat different in detail from those which mould their congeners ashore. Even contact with a different medium, varying in composition, in currents, in pressure, in contained food and oxygen, and the like, obviously involves a great diversity in structure. Modes of motion, from the swimming bell of a medusoid contracting and expanding in the tide, to that of the lowest vertebrates as illustrated in the pelagic Tunicates, or from the paddling of worm and crustacean to that of fish and frog, duck and seal, are at once familiar adaptations to, and necessary results of aquatic life. Similarly, the smooth and frequently fish-like form, especially of actively locomotive water-animals, is a very noticeable adaptive result of the conditions of life. In the more thoroughly aquatic animals, which have remained in the primitive environment, and have not merely returned to it, the blood is usually purified by being spread out on feathery gills which catch the oxygen dissolved in the water; while in terrestrial forms which have betaken themselves to an aquatic life, the ordinary direct 'air-breathing' is still accomplished at the surface of the water, or in some isolated cases of insects and spiders, by means of the air entangled in their hairs, or even conveyed into their submerged homes. The aquatic respiration of some larval insects, the power that some crustaceans and fishes have of keeping up a respiration on land with a minimum of water about their gills, and above all, the cases of the double-breathing fishes or dipnoi, and of amphibians already referred to, are specially instructive in regard to the problem of transition from one medium to the other. The genuinely aquatic animals are known to have a body temperature not much higher than that of the surrounding

medium, and often survive even the freezing of the water; while in the higher warm-blooded vertebrates which have returned to an aquatic habit, various modifications, such as thick fur and plumage, waterproof varnish, formation of blubber, serve as protections against the cold. The sensitiveness of many forms to changes in the volume, movement, and composition of the water, the importance of the aquatic habit in relation to the dispersion of types, the power exhibited by some of the lower animals in avoiding death or at least extinction during drought, will be discussed in the articles on ENVIRONMENT, GEOGRAPHICAL DISTRIBUTION, and DESICCATION.

Aquatic Plants. The presence of water is not only essential to the active life of all organisms, but is peculiarly necessary for plants which are for the most part dependent for food-supply on matter dissolved in water, as well as on the carbonic anhydride mingled with the surrounding medium. Numerous plants are, moreover, in the strict sense of the word aquatic, having never acquired or having lost all direct connection with the soil. The simplest plants or Algae are almost all aquatic, though many occur in damp situations on land, or on other organisms, while others remain for long periods quiescent in comparative dryness. Many Algae are absolutely isolated in the water, while others are more or less intimately fixed to some solid substratum. Fungi are very seldom found in water, and lichens are also emphatically terrestrial. Some Liverworts, again, occur floating in lakes, but the majority grow in very damp places, and mark the transition to the generally terrestrial life of mosses and ferns. Some Rhizocarps, such as *Salvinia*, are aquatic, with leaves rising to the surface, while others are land or marsh plants, like the higher horse-tails and club-mosses.

Among the flowering plants or phanerogams, a return to aquatic life is exhibited by numerous, though exceptional cases, while a very large number grow in moist situations, and have a semi-aquatic habit. The simple Monocotyledons known as Helobiæ (q.v.) or marsh-lilies are more or less strictly water-plants. The Arrow-head, q.v. (*Sagittaria*), and other Alismaceæ; the *Butomus* of the marshes; *Hydrocharis*, with floating kidney-shaped leaves; the water-soldier (*Stratiotes*), with narrow submerged leaves; and the Canadian pond-weed (*Anacharis*, q.v.), which, though entirely flowerless in Europe, threatens to choke some canals and lakes, are familiar representatives. The little duck-weed (*Lemna*) floating on the surface of stagnant pools is one of the commonest aquatic Monocotyledons; and the pond-weeds (*Potamoæ*) found both in fresh and salt water; the lattice-plant (*Aponogeton*, see fig. 1), with its skeleton leaves; various estuarine and fresh-water Naiadaceous plants—e.g. *Zostera* and *Najas*, are also common instances, while those growing in marshy ground are much too numerous to mention. Among Dicotyledons, the white water buttercup (*Ranunculus aquatilis*), with its slightly divided floating, and much dissected submerged leaves; the yellow and white water-lilies (*Nymphaea*); the sacred lotus-flower of the Ganges and Nile (*Nelumbium*); the gigantic *Victoria regia* of tropical South America; and the insectivorous bladderwort or *Utricularia*, are among the most familiar aquatic forms.

Numerous modifications have naturally resulted in adaptation to aquatic life. The roots growing out in a relatively frictionless medium may become, as in *Hydrocharis* and *Pontederia* (see Root), long and delicate, covered with numerous and uniform root-hairs, which thus expose a large absorbing surface. In *Utricularia*, on the other hand, where the whole plant is submerged with

the exception of the flower-stalk, root-structures are not developed at all. The leaf-stalks of a *Pontederia* growing in the water, show, when contrasted

Fig. 1.

A, Madagascan Lattice leaf (*Ouvia fenestrata*, or *Aponogeton fenestrata*), showing open fenestrated leaves in adult state, with young leaves at first entire, and showing, as they develop, the progressive rupture of parenchyma between the fibro-vascular bundles ('veins'). B, Leaf of Pond-weed (*Aponogeton*), to show floating type (entire) with same venation.

with those of another growing on land, an enormous development of air-spaces, which serve to buoy up the floating plant. Submersion seems to increase the surface of leaves at the expense of their thickness, and this in Monocotyledons usually

Fig. 2.

A, *Pontederia crassipes* of Amazon: ordinary floating form with air-spaces in leaf-stalks, and branched roots. B, a runner which has taken root on land, and accordingly reverted to the ordinary form of root and leaf-stalk.

results in elongation in one direction (*Sagittaria*, *Vallisneria*, &c.), and in Dicotyledons, in the development of numerous capillary divisions, as in *Ranunculus aquatilis* and *Myriophyllum*. The change may sometimes be experimentally demonstrated by artificial change of environment, while the foliage of *Sagittaria*, *Alisma*, *Nuphar*, &c. is very different, according as the leaves are submerged, floating, or aerial. In aquatic plants, the Stomata (q.v.) are usually absent or scarce on the lower surface of the floating leaves, and on both sides of the submerged; and many more intimate

changes, such as the disappearance of hairs, the occurrence of chlorophyll in the epidermis, and so on, have been repeatedly observed to follow change to an aquatic medium. Some plants, such as *Zostera*, even flower under water, but an exposure and relative drying at the surface has been shown to be in some cases essential to the germination of the seeds. The fruits of the water-lily keep afloat by means of large air-spaces, and those of the arrow-head are protected by a thick oily rind. The whole subject of the adaptive modifications of aquatic plants is obviously a special case of the general problem of the relation between organism and environment, and for further details reference must be made to the separate articles on some of the plants cited as instances, and to ENVIRONMENT.

Aquatint, a mode of etching on copper, by which imitations of drawings in Indian ink, bistre, and sepia are produced. On a plate of copper a ground is prepared of black resin, on which the design is traced; a complicated series of manipulations with varnish and dilute acid is then gone through, until the desired result is attained. See ENGRAVING, and a monograph by Pideaux (1910).

Aqua Tofana, a mysterious poisonous liquid, applied to criminal purposes by a Sicilian woman named Tofana, about the end of the 17th century. Many wonderful stories are told of the great efficacy of this poison, but the best toxicologists believe that it was principally a solution of arsenic. See POISONING (*Secret*).

Aqua Vitæ (Lat., 'water of life') is a common term applied to ardent spirits; especially, in commerce, spirits of the first distillation, or unrectified. During the alchemical epoch, brandy or distilled spirits was much used as a medicine, was considered a cure for all disorders, and even got the credit of prolonging life. French *eau de vie* (brandy) has the same meaning, as well as our words *whisky* and *usquebaugh*; the former a Scotch, the latter an Irish form, from a common Gaelic and Irish, *uisge bheatha*.

Aquaviva (Claudio Acquaviva; 1543-1615), fifth general of the Jesuits, belonged to an old Neapolitan family. Entering the order at the age of twenty-five, he became its head thirteen years later. His principal work was the organisation of the body, and his ordinance regulating the studies of the Jesuits became famous under the title 'Ratio Studiorum' (1586).—For Cardinal Giulio Acquaviva, see CERVANTES.

Aqueduct. This term is perhaps most commonly understood to mean a bridge of stone, iron, or wood, for conveying water across a valley. But a pipe, an open channel, or a tunnel through a mountain is equally an aqueduct, if its function is to convey water from one place to another. All great aqueducts have been constructed for the purpose of conducting water from some more or less distant source to large towns or cities. The term is also properly applied to a bridge carrying a canal for the purposes of navigation.

Roman Aqueducts.—The aqueducts of the Romans were amongst the most magnificent of their works, and the noble supply of water which modern Rome derives from the four now in use, of which three are ancient, gives the stranger a very vivid conception of the vast scale on which the ancient city must have been provided with one of the most important appliances of civilisation and refinement, when nine were employed to pour water into its baths and fountains. The bridge portions of an ancient Roman aqueduct consist most frequently of one row of arches, but sometimes, as in the annexed figure (fig. 1), of two, and occasionally, when the height is great, even of three tiers. Some of these were built of hewn stone and others of brick, but

in nearly every case they were very substantially constructed. Several of them, indeed, after the lapse of two thousand years, have been put in repair and used again as modern aqueducts. The water-channel in one or two of the larger ones is about

Fig. 1.—Aqua Alexandrina.

5½ feet high and 4 feet wide. This was, of course, formed in the upper part of the structure, above the arches, and was covered on top, bottom, and sides with a lining composed of lime, sand, and pulverised brick, which in time acquired the hardness of stone. The declivity of these ancient aqueducts was generally about 1 in 200, a much greater slope than is given to modern works of a similar kind. Reservoirs (*castella*) were built at regular intervals along the aqueducts to enable repairs to be made, and to supply water, where necessary, to the inhabitants of the outlying districts.

Of the nine aqueducts which brought water to ancient Rome, three still supply the modern city. (1) The *Aqua Virgo*, now called *Acqua Vergine*, which was restored by Pope Nicholas V. in 1453. This name is said to have originated from a young girl having pointed out the spring at its source to some soldiers. The aqueduct was made by Agrippa, and finished about the year 27 B.C. It mainly consists of a subterranean channel 14 miles in length, and supplies daily about 13,000,000 cubic feet of excellent water. (2) The *Aqua Trajana*, restored by order of Paul V. in 1611, hence its modern name of *Acqua Paola*. It stretches from Rome to the lake of Bracciano, a distance of 31 miles. (3) The *Aqua Marcia*, constructed by the prætor Q. Marcius Rex in 146 B.C. This is 56 miles in length, and is very little shorter than the longest of the ancient aqueducts at Rome. It was restored so recently as 1869, and brings a supply of water from the Sabine Mountains. The noble arches which stretch across the Campagna for some 6 miles on the road to Frascati are a portion of this aqueduct. Besides these three repaired ancient aqueducts, a fourth of comparatively recent date supplies modern Rome. This is the *Acqua Felice*, completed by Sixtus V. in 1585, and largely built of material taken from the arches—about 10 miles in length—of the ancient *Aqua Claudia*. The length of the *Acqua Felice* is some 13 miles, and two-thirds of it is subterranean.

Provincial Roman Aqueducts.—Away from the capital there are a number of ancient Roman aqueducts in Italy itself. The ruins of one exist at Mayence, and of another near Metz, in Germany. France possesses, in the Pont du Gard at Nîmes (fig. 2), erected in the time of Augustus, one of the finest and most perfect of the aqueduct-bridges built by the Romans. It is higher than any about Rome itself, being fully 180 feet in height, and the length of its highest arcade is 873 feet. Spain has also interesting Roman works of this kind at Segovia, at Tarragona, and at Merida. The one at Évora, in Portugal, is still in excellent preservation.

Spoleto Aqueduct.—As forming a link between the ancient Roman structures and the great aqueduct-bridges of modern times, that of Spoleto,

Fig. 2.—Pont du Gard, Nîmes.

about 60 miles to the north-east of Rome, should be mentioned. Erected in the 6th or 7th century, it serves both as a bridge and as an aqueduct, and is a wonderful piece of engineering for its time. The very tall piers are built of a durable stone, and the pointed arches are of brick. It is about 300 feet high, nearly 700 feet long, and the ten great arches have each a span of 66 feet. These are surmounted by a row of much smaller arches carrying the canal of the aqueduct. There exists some doubt as to whether the arches of this very interesting bridge are not of considerably later date than the piers.

Maintenon Aqueduct.—Many centuries elapsed before another aqueduct of special interest or importance was undertaken in Europe. In 1684 Louis XIV. set his engineers to construct an aqueduct to convey the waters of the Eure from Point Gouin to Versailles. Troops to the number of 40,000 were employed in this great undertaking. Thousands of these men died during the progress of the work, which was interrupted during the war of 1688 and never resumed. The bridge at Maintenon, forming part of this aqueduct, even in its incomplete state, is, in point of magnitude, the grandest structure of the kind in the world. The remains consist of forty-seven arches, each 42 feet wide and 83 feet high. The piers are 25 feet 6 inches thick.

Marseilles Aqueduct.—The aqueduct, 60 miles in length, which conveys water from the river Durance to Marseilles, is another magnificent specimen of French engineering. It was finished in 1847.

Croton Aqueducts.—New York is supplied with water from the Croton River, which falls into the Hudson. The aqueduct at present in use was constructed between the years 1837 and 1842. It is 38 miles long, with a declivity for the greater part of its course of $1\frac{1}{4}$ inches to the mile. For a length of 33 miles the water-channel is 8 feet 5 inches in height, and 7 feet 8 inches in greatest breadth. Stone, brick, and cement are used for the encasing masonry, which varies slightly as the channel is formed in rock, or earth, or in an open cutting. In flat valleys the built conduit has sloping earth embankments on each side. When it reaches the Harlem River the water is conveyed in iron pipes over a splendid bridge. These large pipes also connect the receiving and the distributing reservoirs, which are two miles apart.

This first Croton aqueduct, though justly considered one of the grandest modern works of its kind, has been found to be totally inadequate for New York. Accordingly a new aqueduct on a more stupendous scale was constructed in 1883-90, with a dam of vast size (1350 feet long, 277 high, 216 wide). For more than 28 miles the conduit or water-channel is tunnelled through solid rock, at a depth of 150 feet below the surface, and is generally 14 feet high and wide. It passes under the Harlem River at a depth of 300 feet below the river-bed, and cost \$25,000,000 (see the articles NEW YORK, WATER). The port of Mollendo in Peru has an iron aqueduct of 85 miles laid along the railway from Arequipa.

Manchester.—Very large works were constructed in 1868-77 to bring water from Longdendale to Manchester. In the greater scheme for bringing water from Lake Thirlmere in Cumberland (1885-94), the length of the line is nearly 100 miles. A tunnel, three miles long and 270 feet below the surface, forms the first part of the aqueduct. The distance is close on 100 miles ($95\frac{1}{2}$ to Prestwich reservoir)— $13\frac{1}{2}$ in tunnels, 38 in shallow tunnels cut from the surface, and $44\frac{1}{2}$ miles in siphon pipes of 40 inches diameter. The aqueduct passes under Dunmail Raise, north of Grasmere, Ambleside, Windermere, and Kendal, east of Lancaster and Preston, across Lune and Ribble, past Chorley, and west of Bolton. The ultimate supply is 50,000,000 gallons daily, and the cost £4,500,000.

Birmingham and Midlands.—The Birmingham water-supply (inaugurated 1904), bringing water from the counties of Cardigan, Radnor, Brecknock, and Montgomery to Birmingham, has a total length of 73 miles of aqueduct.—The Midland water scheme to impound the waters of the rivers Deverent and Ashop for the supply of the towns of Leicester, Derby, Sheffield, and Nottingham, and the counties of Derby and Notts, has about 100 miles of aqueduct for the distribution of the supply.

Glasgow.—An aqueduct from Loch Katrine, 35 miles long, was begun in 1855 and completed in 1860. The tunnelled portion is 13 miles in length, and is 8 feet high and 8 feet wide, with an inclination of 10 inches in a mile. Siphon pipes of cast-iron are laid across the valleys, having an inclination of 5 feet in a mile. The ravines are crossed by aqueduct-bridges of varying character. Where they are deep they are crossed by wrought-iron tubes, 8 feet wide by $6\frac{1}{2}$ feet high, supported by stone piers 50 feet apart. Over small mountain-streams the aqueduct consists of cast-iron troughs, supported on beams of the same material. In those portions of its course where suitable rock is abundant, some of the bridges are of freestone. There is one tunnel at the commencement of the aqueduct, near Loch Katrine, 2325 yards long, and at the other end, near Glasgow, the Mugdock tunnel is 2640 yards in length. A great additional supply from the same source, increasing the daily provision from 50,000,000 to 100,000,000 gallons daily, was secured by new works completed in 1889-95, which constitute practically a complete duplicate of the former ones (with a distinct reservoir, &c.). The cost of both systems has been about £3,000,000.

Liverpool Aqueduct.—Another aqueduct of great magnitude was constructed in 1881-92 for the supply of water to Liverpool from the river Vyrnwy (q.v.) in Wales. Its total length is 68 miles. It consists partly of tunnel and partly of three parallel lines of iron pipes. The first (Hirnant) of the three chief tunnels is $2\frac{1}{4}$ miles long, 7 feet in diameter, and has a gradient of 1 in 2340. The cost was about £2,500,000.

Vienna Aqueduct.—This aqueduct is nearly 60 miles long, and was finished in 1873. The springs are at the foot of the Styrian Alps, and are about 1150 feet above the level of the Danube at Vienna. The size of the section of the conduit or waterway varies, but it nowhere exceeds 6 feet 6 inches in height, by 4 feet in width. At several places in its course there are extensive aqueduct-bridges, and these are built either entirely of stone, or of stone and brick; one has forty-three arches. This aqueduct supplies 20 million gallons of water per day. It cost about two million pounds sterling.

Bombay Aqueduct.—A gigantic scheme for the supply of Bombay from the river Tansa (q.v.), 65 miles N. of Bombay, was completed in 1886-92. The aqueduct consists mainly of two lines of cast-iron pipes, 48 inches in diameter, which here are allowed, for the most part, to lie on the surface of the

ground. There no frost can injure them, and any leakage can be at once seen.

Canal Aqueducts.—Of aqueduct-bridges for carrying navigable canals across rivers or valleys, the finest in Great Britain is that built by Telford over the Dee in Wales. Another fine bridge of this kind, designed by Rennie, crosses the river Lune. In Scotland there is one at Slateford, near Edinburgh, and another over the Kelvin at Glasgow.

Aqueous Humour, the watery fluid which fills the space in the eye between the cornea and the lens. See EYE.

Aqueous Rocks, rocks which owe their origin to the mechanical or chemical action of water. In some systems of classification, the term is synonymous with *sedimentary rocks*. See GEOLOGY.

Aquifolia'ceæ, the holly order, are archichlamydeous dicotyledons allied to Rhamnaceæ and Celastraceæ. They are all shrubs or trees, and are chiefly natives of tropical and subtropical America. The most interesting species belong to the genus *Ilex*. See HOLLY, PARAGUAY TEA.

Aquila, the capital of the Italian province of the same name, beautifully situated on the Alterno, near the loftiest of the Apennines, 64 miles S.E. of Terni by a railway opened in 1884. It was built by the Emperor Frederick II. from the ruins of the ancient *Amiternum*, a town of the Sabines, and the birthplace of Sallust the historian. In 1703 it was almost destroyed by an earthquake, in which 2000 persons perished. Aquila, which is a bishop's see, is a busy place, and besides a large trade in saffron, which is the principal product of the surrounding district, the manufacture of paper, linen, and wax is carried on. Pop. 24,000. The province of Aquila is most picturesque, snow-topped mountains and smiling valleys alternating. Area, 2500 sq. m.; pop. (1921) 395,799.

Aquila, PONTICUS, a celebrated translator of the Old Testament into Greek, born at Sinope. He flourished about the year 130 A.D.; is said to have been related to the Emperor Hadrian, and to have been first a pagan, then a Christian, and finally a Jew; submitting in his last conversion to circumcision. His translation of the Old Testament—which appears to have been undertaken for the benefit of his Hellenised countrymen—was so *literal*, that the Jews preferred it to the Septuagint, as did also the Judaizing sect of Christians called Ebionites. The version was praised by both Jerome and Origen, and such fragments of it as remain may be found in the latter's *Hexapla* (q.v.).

Aquilariaceæ. See ALOES WOOD.

Aquilegia. See COLUMBINE.

Aquile'a (also *Aglus*) is a small town in Italy, at the head of the Adriatic, 22 miles N.W. of Trieste; pop. about 3000. It is now sunk to utter insignificance, possessing no trade or public buildings of any note, except its cathedral; but in the time of the Roman emperors, it was one of the most important places north of the metropolis, and was a central point of the transit-trade between the north and south of Europe. Founded by a Roman colony in 181 B.C., it was so strongly fortified by Marcus Aurelius, as to be considered the first bulwark of the empire against the northern barbarians. Here the Emperor Maximin perished; and in the vicinity Constantius lost his life in a battle against his brother Constans. When the town was destroyed by Attila (452), it had 100,000 inhabitants. It never recovered, although it was rebuilt by Narses, but slowly dwindled into deeper obscurity. Councils were held at Aquileia in 381, 558, 698, and 1184 A.D.; its bishops called themselves patriarchs, and

claimed to rank next the pope. Austrian till 1919, it became Italian by the treaty of St Germain's.

Aquinas, THOMAS (or *Thomas of Aquino*), the prince of scholastic theologians, was of the family of the Counts of Aquino, and was born about 1226 in the castle of Rocca Secca, near Aquino, a small town of 3000 inhabitants, halfway between Rome and Naples. He received the rudiments of his education from the Benedictine monks of Monte-Casino, and completed his studies at the university of Naples. A strong inclination to solitude and the religious life determined him, against the will of his family, to enter (1243) the order of Preaching Friars founded by St Dominic, who had been dead twenty-two years. In order to frustrate the attempts of his mother to remove him from the convent, he was sent away from Naples, first to Rome and then to Paris; but his brothers took him by force from his conductors, and carried him to the paternal castle. Here he was guarded as a prisoner for two years, when, by the help of the Dominicans, he contrived to escape, and went through France to the Dominican convent at Cologne, in order to enjoy the instructions of the famous Albertus Magnus (q.v.). According to another account, he owed his release from confinement to the interference of the emperor and the pope. At Cologne he pursued his studies in such silence, that his companions gave him the name of the 'Dumb Ox.' But Albert is said to have predicted 'that this ox would one day fill the world with his bellowing.' In 1248, being 22 years of age, he was appointed by the general chapter of his order to teach at Cologne, together with his old master, Albert. He now began to publish his first works, commentaries on the ethics and the philosophy of Aristotle. In 1252 he was sent to Paris. His masterly application of this philosophy to the systematising of theology, soon procured him a distinguished reputation. It was not, however, till 1257 that Aquinas and his friend St Bonaventura, the Franciscan, obtained their degree of doctor, as the university of Paris, under the influence of William de St Amour, was hostile to the mendicant friars. He vindicated the principles of these orders in an important work; and, in a disputation in presence of the pope, procured the condemnation of the books of his adversaries. He continued to lecture with great applause in Paris, till Urban IV. in 1261 called him to Italy to teach in Rome, Bologna, and Pisa. It was at this time he composed most of his great works.

Even during his life Aquinas enjoyed the highest consideration in the church. His voice carried decisive weight with it; and his scholars called him the 'Angel of the Schools' or 'Angelic Doctor.' A general chapter of Dominicans in Paris made it obligatory on the members of the order to defend his doctrines. Both Urban IV. and his successor, Clement IV., who were much attached to Aquinas, pressed upon him the highest ecclesiastical dignities in vain. So great was his modesty, and his love of poverty and study, that he refused the archbishopric of Naples.

Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew, and was almost equally ignorant of history; but his numerous writings display an intellectual power of the highest order. He gave a new and scientific foundation to many doctrines of his church, especially that of transubstantiation. He also treated Christian morals according to an arrangement of his own, and with a comprehensiveness that procured him the title of the 'Father of Moral Philosophy.' The definiteness, clearness, and completeness of his method of handling theology were such that his *Summa Theologiae*, which may be said to be the first attempt at a complete theolo-

gical system, remains to this day substantially the standard authority in the Roman Church. Another important work of Aquinas is his *Summa contra Gentiles*, which deals chiefly with the principles of natural religion. His commentaries on Scripture and devotional treatises also have a high reputation. His influence on the theological thought of succeeding ages was immense. At the council of Trent, the *Summa* was honoured with a place on the table by the side of the Bible. It was at Bologna that he began this his greatest work, by which his name will always be connected, but which he never lived to complete. A legend tells how, when engaged in fervent prayer regarding this book, he heard the words from his crucifix: 'Thou hast written well of me, Thomas: what reward dost thou ask?' and he answered, 'None other but Thyself, O Lord.' On December 6, 1273, he was writing at Naples the 90th question of the third part of the *Summa*, when weakness of health compelled him to break off his studies. But Gregory X., who had called a general council to effect the union of the Greek and Latin churches, summoned Aquinas to defend the papal cause at Lyons, where the council was to meet on May 1, 1274. He set out, though suffering from fever, and was surprised by death on the road at the Cistercian abbey of Fossa-Nuova, March 7, 1274. All Europe mourned his loss. Miracles were said to be wrought at his funeral. Universities, religious orders, and princes contended for the honour of possessing his body. It was finally bestowed by the pope on Toulouse, where it was received by 150,000 persons headed by Louis, Duke of Anjou. Aquinas was canonised by John XXII. in 1323, and proclaimed a 'Doctor of the Church' by Pius V. in 1567.

The only scholastic theologian who in any degree rivalled Aquinas in his own age, was the so-called 'Subtle Doctor,' Duns Scotus, of the order of St Francis. The Franciscans naturally followed Scotus, and the Dominicans Thomas, and henceforward medieval theologians were divided into two schools, Scotists and Thomists. The divergencies which penetrate more or less every branch of doctrine depend upon the different systems of metaphysics or scholastic philosophy upon which the theologies were based. The differences concerned the idea of God, the operations of grace and of justification, the mode in which the sacraments take effect, &c. Popularly, Scotism is best known for its advocacy of the Immaculate Conception of Mary, and for the doctrine, with which it is remotely connected, that the Incarnation would have taken place (though of course without suffering or death) if Adam had not sinned. The more recondite peculiarities of Scotist theology and philosophy are now almost entirely confined to the theologians of the Franciscan order. On the other hand, Thomism represents, with few exceptions, the general teaching of the Catholic Church. The school is now not so much opposed by the Scotists as by the eclectic school of Jesuit theology. The first complete edition of Aquinas's works was published in 17 vols. folio at Rome in 1570. They have been frequently reprinted, the latest and best edition having been begun in 1883 under the auspices of Leo XIII. The most convenient edition of the *Summa* is that of Migne (4 vols.). St Thomas was the author of *Pange Lingua* (q.v.), and other eucharistic hymns of the Roman Breviary.

See the Life by Archbishop Vaughan (1872; new ed. 1893), and those by Cavanagh (1890), Werner, Costelloe, and Conway (1911). There are many translations, and a volume of selected translations by Neill (1909).

Aquitania, the Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes, and by Celtic families who settled among them.

Augustus, when he divided Gaul into four provinces, added to Aquitania the country lying between the rivers Garonne and Loire. Afterwards it passed into the hands—first, of the West Goths, and then of the Franks; and during the Merovingian dynasty, became an independent duchy. Gascony, a duchy in the extreme SW., became in 1054, through the extinction of the male line, a part of Aquitania, which had come in the 10th century to be called *Guienne*, a corruption of its original name. In 1137 it was united to the crown of France by the marriage of Louis VII. with Eleanor, heiress of Aquitania. In 1152 it became an English possession, through the marriage of Henry II. with Eleanor, whom Louis had divorced, and it remained an appanage of the English crown until, in 1452, Charles VII. finally united it to France by the capture of Bordeaux.

Arabesque (Fr.), a peculiar kind of fantastic decoration, either sculptured or painted, which the Spanish Moors are supposed to have introduced into modern Europe. But the species of enrichment to which this term is now

applied was extensively employed both by the Greeks and Romans, the latter in particular being masters of the style. The Egyptians, from whom the Moors probably derived their original notions of this and other forms of art, also employed it in their monumental decorations. The arabesque of the Moors entirely excluded the figures of animals, the representation of which was forbidden by the Mohammedan religion, and confined itself to the foliage, &c. of plants and trees, curiously and elaborately intertwined. This limitation was again departed from when the decorations were discovered on the walls of the baths of Titus, in the time of Leo X. More recently those in the houses at Herculaneum and Pompeii came to form the models of imitation, and the modern arabesque consists usually of combinations of plants, birds, and animals of all kinds, including the human figure, and embracing not only every natural variety, but stepping without hesitation beyond the bounds of nature. The arabesques with which Raphael adorned the galleries of the Vatican are at once the most famous and the most beautiful which the modern world has produced. See CELTIC ORNAMENT, MURAL DECORATION. The word has been transferred to music, and is the title of a well-known piano-piece by Schumann.

Arabesque Panel.
(From the Mosque
at Cordova.)

Arabgir', or **ARABKIR** (anc. *Anabrace*), a town of eastern Anatolia, in a mountainous and rocky district, not far from the Euphrates, and on the caravan road from Aleppo to Trebizond; pop. 20,000. It owes its prosperity to the enterprise and industry of the Armenians. It is specially noted for the manufacture of goods from English cotton yarn.

Arabia—called by the inhabitants Jezirat-al-Arab (the peninsula of Arabia), by the Turks and Persians Arabistân—is the great south-western peninsula of Asia, and is situated 12° 40'–34° N. lat., and 32° 30'–60° E. long. Its greatest length from NW. to SE. is about 1800 miles; its mean breadth, about 600; its area, 1,230,000 sq. m.; and its population conjectured to be from 3,000,000 to 5,000,000. It is bounded on the N. by the high-

lands of Syria and the plains of Mesopotamia (or by a line from El Arish on the Mediterranean to the Euphrates delta), on the E. by the Persian Gulf and the Gulf of Omân, on the S. by the Arabian Sea, and on the W. by the Red Sea and the Suez Canal. Midway between Mecca and Medina runs the tropic of Cancer. Ptolemy is supposed to be the author of the famous threefold division into *Arabia Petraea*—i.e. the Arabia of the city of Petra, in the NW.; *Arabia Felix*, a mistranslation of Yemen, which means not 'happy,' but on the right—i.e. to the ancients, the entire peninsula (viewed from Alexandria), but to medieval Moslems (facing east) the land south of Mecca or south-west Arabia; and *Arabia Deserta*, at first merely the Syrian desert, later the whole interior. Modern divisions are: the *Sinaitic Peninsula* (see SINAI), between the Gulfs of Suez and Akaba; *Hedjaz* (the Barrier), along the Red Sea, with *Midian* in the north-west; *Yemen* (with *Asir* to the north), the southern strip on the Red Sea; *Hadramaut*, along the south coast; *Omân*, the south-eastern end of the peninsula; *El Hasa*, along the Persian Gulf; *Nejd*, the Central 'Highlands.'

In shape Arabia is an irregular parallelogram, broadest at the southern end; in character it is mainly African. The vast central plateau rises from a height of 2500 feet in the north to 7000 feet in the SW., and is bounded by western and southern mountain chains. The highest peaks rise in the NW., SW., and SE. corners—e.g. Jebel Katherin in Sinai (8540 feet); Jebel Manar, N. of Aden Protectorate (10,500 feet); Jebel Akhdar in Omân (10,000 feet)—and SE. of Mecca. Hedjaz and Yemen extend from the Red Sea indefinitely towards the interior, and consist partly of *Tehama*, or low hot country, mostly sterile, along the sea, and partly of the mountain district beyond. Yemen is on the whole well watered, has rich and fertile valleys, grows coffee and cereals in the uplands, and is the most cultivated and most populated part of Arabia. Hadramaut is little known, but resembles the Hedjaz in character. Omân is mainly mountainous, and is partly very fertile. Hasa is comparatively level and fertile. Large portions of Arabia are perfectly arid; no river reaches the sea all the year round; one-third of the whole area may be accounted desert and uninhabitable.

Our knowledge of the interior of Arabia is still very imperfect in detail. The largest portion of it lies in that great desert zone which stretches from the shores of the Atlantic to those of the Northern Pacific. Nejd, the northern highland or central plateau of Arabia, is a compact settled district, culminating in the crescent-shaped Jebel Toweik, which is intersected by numerous valleys, roaring torrents during the rains, but dry depressions at other times. North of Nejd, and separated from it by a narrow arm of desert, is the smaller plateau of Jebel Shomer, crossed by the ranges of Jebel Aja and Jebel Selma. Great Nafud, the northern desert, partly stony, and partly a burning expanse of red sand, is thinly sprinkled over with oases of wells and grass, serving as halting-places for the caravans of merchants or pilgrims. Jauf, Sakaka, and other oases lie between Great Nafud and the Syrian desert (*Hamad*) in the extreme north. From the south-east of Great Nafud, Little Nafud runs down to join *Dahna*, the southern and main desert of Arabia, which extends from Nejd to the Hadramaut coast-range, and has never been explored by any European. The east and west coasts are dotted with small islands. Pilgrim and caravan routes converge at the holy cities of Mecca and Medina (in Hedjaz) and the ports Jiddah and Yambo (Hedjaz), Loheia, Hodeida and Mocha (Yemen), Aden, Makalla (Hadramaut), Muscat,

(Omân), and Koweit (q.v.); at Sana, Hail, Riâd, and El Hofuf (chief towns of Yemen, Shomer, Nejd, and El Hasa). The Hedjaz railway reached Medina in 1908 on its way from Damascus to Mecca. The Bagdad railway will touch N. Arabia at Basia.

Political Divisions.—Sinai is part of Egypt. Hedjaz, Asir, and Yemen on the Red Sea, and El Hasa on the Persian Gulf, were provinces of Turkey, though her hold on Asir especially was slight. The independent Emir (since 1921 Sultan) of Nejd (see WAHÂBIS) in 1913 seized El Hasa, and in 1921 Shomer or Jebel Shammar. The other Turkish provinces secured independence in the Great War. Aden is a British settlement and protectorate, with Hadramaut as its hinterland. Omân is independent. Koweit and Kerak are under British influence. The Bahrein Islands are also British.

Arabia has, on the whole, an African climate. Though it is surrounded on three sides by the sea, its mountain chains exclude in a great measure the modifying influence of currents of air from the ocean. In several parts of Arabia hardly a refreshing shower falls in the course of the year, and vegetation is almost unknown; in other sultry districts the date-palm is almost the only proof of vegetable life. Over large sterile tracts hangs a sky of almost unbroken serenity. The short rainy season which occurs on the west coast during our summer months fills periodically the *waddis* (hollow places) with water, while slight frosts mark the winters in the centre and north-east. During the hot season the Simoom (q.v.) blows, but only in the northern part of the land. The terraced districts are more favourable to culture, and produce wheat, barley, millet, palms, tobacco, indigo, cotton, sugar, tamarinds, excellent coffee, senna, and many aromatic and spice plants, as balsam, aloe, myrrh, frankincense, &c. Arabia is destitute of forests, but has vast stretches of desert grass fragrant with aromatic herbs, and furnishing admirable pasturage for the splendid breed of horses. Coffee, one of the most important exports, is an indigenous product both of Arabia and Africa.

In the animal kingdom an African character prevails generally. Sheep, goats, oxen, camels, and horses are abundant among the settled inhabitants; the wandering tribes have no oxen. The noble breed of Arabian horses has been cultivated for several thousand years. The best are reared in Nejd; they never reach the European market. But the most characteristic of all animals in the peninsula is the camel, which has been both poetically and justly styled 'the ship of the desert.' It may be regarded as an Arabian animal, for it seems to be proved that it is not a native of Africa, but has migrated from the peninsula with its master. The breed of Omân is celebrated for its beauty and swiftness. Gazelles and ostriches frequent the oases of the deserts, where the lion, panther, hyena, and jackal hunt their prey. Monkeys, pheasants, and doves are found in the fertile districts, and flights of locusts often make sad devastation. Fish and turtle abound on the coast. Pearls are found in the Persian Gulf (especially round Bahrein), and mother-of-pearl in the Red Sea. Among the minerals of Arabia may be mentioned iron, copper, lead, coal, basalt, and asphaltum, and the precious stones, emerald, carnelian, agate, and onyx. Burton sought gold in Midian, but without avail. Salif, in Yemen, has salt-mines.

Inhabitants.—The most interesting feature of the peninsula is its population. The Arab is of medium stature, muscular make, and brown complexion. Independence looks out of his glowing eyes; by nature he is quick, sharp-witted,

imaginative, and passionately fond of poetry. Courage, temperance, hospitality, and good faith are his leading virtues; but these are often marred by a spirit of rapacity and sanguinary revenge. His wife or wives do the work, keep the house, and educate the children.

Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouin, who have, however, their allotted winter and summer camping-grounds, and a strong attachment to their own mode of life, entertain notions of the rights of property differing seriously from those regulating the West; yet even their most marauding tribes are not without a traditional code of law and honour, the only law recognised among them; the enforcing of it is left to every tribesman. The settled tribes, styled Hadesi and Fellahs, are despised by the Bedouin, who scorn to intermarry even with the few artisans that accompany every tribe. The Bedouin are several times outnumbered by the settled population, and therefore must not be regarded as normal Arabs, who are adventurous, commercial, and willing to become sailors. Yet mountain and desert barriers and patriarchal anarchy make Arabia the 'anti-industrial centre of the world,' where passing centuries bring no improvements save such as are forced on it by foreigners. The export of coffee, dates, figs, spices, and drugs, though still considerable, is said to be only a shadow of the old commerce which existed before the circumnavigation of Africa. Arabia has few manufactures, but carries on a transit-trade in foreign fabrics, besides importing these to some extent for its own necessities. Education is mostly confined to that within the household, where, however, a boy is instructed in reading and writing, in grammar, history, and poetry, and where he is trained to habits of politeness and self-restraint. In the few higher public schools, writing, grammar, and rhetoric compose the whole curriculum. The government is patriarchal, and the chief men of the various tribes have the title of Emir, Sheikh, or, in a religious sense, Imâm. Their function appears limited to leading the troops in the time of war, to levying tribute, and to the administration of justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been unfrequent both in early and modern times.

History.—The Arabs are of two main races. The one occupying the north half of the country is conveniently called the Ishmaelitic; the other, covering the southern half, is called the Yoktanic if we use the Hebrew word—the Kahtanic if we use their own—and is in Arabia regarded as the pure old Arab stock. The origin of the Kahtanites is probably African. In prehistoric times they issued from Yemen, the most highly civilised part of the peninsula, in powerful colonies to Oman and Central Arabia.

If blessed is the country that has no annals, peculiarly blessed was Arabia before Islam, for then 'the history of the Arabs was the songs of the bards.' In 24 B.C. Ailius Gallus, prefect of Egypt under Augustus, attacked Yemen unsuccessfully. Trajan appropriated some extreme northern parts bordering on the empire, but they were restored after his death. Persia, too, intruded over the nearest frontier. In the 4th century the Abyssinians invaded Yemen, not for the first time, and they long ruled it. Again, in 529, a large Abyssinian army subdued Yemen, and held their ground for 76 years. But Hedjaz, the Barrier, proved impenetrable against Persia, Egypt, Rome, and Byzantium. The Arabs lived then more after the manner of the Bedouins at the present time, in tents of hair or woollen cloth, following the

pasture, exchanging sheep for what corn they needed; their wealth consisting in camels, sheep, horses, and slaves. Government was not, but sheikhs chosen from certain families led the camps. The usage of blood revenge, calling out the kin of the slain against the kin of the murderer, punished or prevented homicide, and thus precluded alike peace and extermination. Gambling and drunkenness were common. Polygamy, and the husband's absolute power of divorce, the common practice of burying female children alive, and many old proverbs, as 'The best son-in-law is the grave,' illustrate the position of woman. Arabs were incurably prone to pillage, passionately fond of freedom, proud of birth, hospitable, true to their word, true to their tribe or to a tribesman, right or wrong, against the world. Scarcely ever was any tribe at peace with all its neighbours. But one bond of union was the annual fair of Okâdh, near Taif, a day's journey east from Mecca, which lasted all the pilgrimage month, and at which horse races, gymnastic sports, and poetic contests relieved the seriousness of trade. Mohammed, to prevent the feuds kindled by these contests, put an end to the fair. Another bond was the Kâaba, the small rude temple of unknown antiquity at Mecca, wherein the tribal idols were collected. In Mohammed's youth, these numbered 365. Late in the 5th century the Koreish tribe became foremost at Mecca, and guardians of the Kâaba. This post had ever been an object of rivalry and war among the tribes of both north and south, giving not only a religious pre-eminence over all Arabia, but the disposal of the offerings of gold, silver, or of other kinds, accumulated in the temple, a fund which was increased by commerce on the Red Sea coast. To religion, destined to play so decisive a part in Arabian history, Arab nature is not much addicted. Before Islam, the primitive Sabæanism was forgotten, or miserably degenerate; the tribal idols, stones, fetiches of simplest kinds, and jinn, were worshipped, and Allah, 'the God,' was vaguely acknowledged. But two monotheistic religions had cast roots among the tribes. Many Jews had immigrated into Arabia after the destruction of Jerusalem, and had made many proselytes, especially in Yemen, whither the Abyssinian conquerors had, in the 4th century, brought Christianity. In north Central Arabia this religion had found earlier access. In Mecca, Mohammed was born of the Koreish tribe in 571, the year of the Elephant, when the Abyssinians of Yemen had brought elephants to the unsuccessful siege of Mecca. Taught by the merits and shocked by the corruptions of those two religions, and by the lack of anything better, he, after a while, introduced by the sword his own doctrines, thus forming the grand epoch in Arabian history, and bringing Arabia into close connection with the general history of civilisation. His flight (Hegira) in July 622, on being driven from Mecca to Medina, where he gathered his first body of adherents, forms the Moslem era. Now, for the first time, the people of Arabia became united under one sceptre and one creed, and powerful enough to erect new empires in the three quarters of the world: in Palestine, Mesopotamia, and Persia; in Egypt and the north of Africa; in Spain. The dominion of the Arabs, from the time of Mohammed to the fall of the khalifate of Bagdad in 1258, or even to the expulsion of the Moors from Spain in 1492, is an important period in the history of civilisation (see MOORS, KHALIF). But the movements that had such great effects on the destinies of other nations, left the peninsula itself in an exhausted and neglected condition. The monotonous darkness and storms of patriarchal anarchy are broken during the next

thousand years by few events of importance. The invasion of Abu Taher, leader of the Carmathian sect (died 950), from the Euphrates, left no remnant of the khalifate, and little of orthodox Islam. Arabia was broken up into independent principalities. The Turks subdued Yemen in the 16th century, and were expelled in the 17th. Omán in the 16th and 17th centuries was in Portuguese hands; the Dutch gained and lost many points; the Persians were driven out by Ahmed ibn Sa'ud in 1759, who thus became sultan of Omán. About 1760 Mohammed-ibn-Abd-il-Wahháb, in Nejd, came forward as restorer of primitive Islam. The sword of his convert Sa'ud gave the Wahábis (q.v.) dominion from the frontiers of Mecca to the Persian Gulf. After his death Mecca and Medina were soon added. The Wahábi empire was shattered (1812-18) by Mohammed Ali, viceroy of Egypt, but almost immediately restored itself. Omán, however, had regained independence under its native sultan. Shomer, to a considerable extent Christian, had, in the beginning of the 8th century, successfully resisted the Omayyad khalifs; had probably become nominally Moslem, then really heathen; was absorbed by the Wahábis, freed itself when they fell, but failed to resist them in 1921. Hasa also freed itself, but, after an obstinate resistance, was reconquered. Turkey occupied it in 1875, and made it part of the sanjak of Nejd. After Mohammed Ali's short independence, Yemen and the Hedjáz were restored to Turkey by treaty in 1841. Indian interests in particular led to Britain's occupying Aden (1839) and other points on the coast. Turkish power, already weak, was overthrown by the Great War of 1914-19. The Emir Hussein proclaimed himself king of the Hedjáz in 1916, and seemed to divide with the reviving Wahábis of Nejd the hope of welding the Arabs into a great united nation.

Authorities on Arabia are Pococke, Niebuhr, Burckhardt, Wallin, Burton, Welsted, Hurgonje, Halévy, Huber, Seetzen, Euting, Blunt, Doughty (new ed. 1920), Zweiner, Musil, Hogarth, Bury (1911, 1915), Philby. See also MOHAMMED, HAJJ, MIDIANITES, MOORS, RED SEA, PERSIAN GULF, ADEN, MUSCAT; the articles referred to above; and those on other regions inhabited by Arabs (Mesopotamia, Palestine, Syria, and the countries of North Africa).—The Arabian Desert is in eastern Egypt.

Arabian Architecture dates from long after the time of Mohammed; the Arabs or Moslems were not a temple-building people, but through intercourse with western nations, desired to give their religion a visible embodiment, like the churches of the Christians. They had accordingly to engage architects and workmen from Byzantium; and their earliest mosques were thus erected in the style of the late empire, the dispositions of the buildings being adjusted to suit the requirements of their worship. By degrees, the court usually placed in front of the Christian church became enlarged and surrounded with arcades, while the church was diminished in size and importance, and was represented merely by a deeper arcade. Such are the early mosques of Cairo, erected during the first two centuries of the Hedjrah, between 622 and 900 A.D. It is noticeable that in these buildings the arches are all of the pointed form, which seems to have been of very ancient use in the East. This was afterwards modified into the horseshoe shape which is peculiarly characteristic of Saracenic art. Gradually a new and fanciful ornamentation known as Arabesque (q.v.) was added to the recognised features of Greek and Roman edifices. The exclusion of animal figures, which their abhorrence of the very appearance of idolatry necessitated, confined the Mohammedan artists to the imitation of vegetable productions, varied by geometrical patterns

and inscriptions, of which the letters were woven into forms which suited them for architectural uses. At first Saracenic art partook largely of the

styles of the countries into which the Mohammedan religion was introduced, but gradually a style more or less homogeneous was evolved, of which fine examples are found in Persia, India, Africa, and Spain, and of which the influence continues to the present day. In India, this style finds expression in the magnificent tombs of the Tatar rulers, with their wonderful domes and graceful minarets (see AGRA). The gateways are also features of great size, on which much ornament is usually displayed. In Spain, the Moors erected many important buildings, from the mosque of Cordova, begun by Abdel-Rahman in 786, which resembles those of Cairo in general idea, to the Alhambra at Granada, erected in the 14th century during the decadence of the Moorish rule. Many of these structures, although beautiful and elaborate in design, are unfortunately built with brick and stucco, and have yielded to the influence of time. The style of the Moors, after their expulsion from Spain, long continued to influence that of the Christians, especially in the southern part of that country.

Arabian Language and Literature.

Regarding the oldest literary culture of the Arabians, we possess but slight information. As far back as Solomon's time, the queen of Sheba (probably *Arabia Felix*) was noted for her skill

in enigmas. The nomadic tribes, living under the patriarchal rule of their sheikhs, possessed everything that was favourable to the growth of a simple and natural poetry. They had quick and vivid feelings, and a rich, glowing fancy, which, operating upon the perils, the hardships, and strange confederate life they led in those barren sand-deserts, and among naked rocks, could hardly fail to call forth a wild and vigorous minstrelsy. Before the time of Mohammed, the Arabians had celebrated poets who sang the feuds of tribes, and the praises of heroes and fair women. During the great fairs at Mecca and Okâdh, poetic contests were held before the people as at the Grecian games; and the poems to which the prize was awarded were re-written in golden characters, and suspended in or on the Kâaba at Mecca, and are therefore termed *Moallakât*, 'suspended.' They are remarkable for their pathos, soaring conceptions, richness of imagery and phraseology, free and unconstrained spirit, and the glow of their love and hate. Among the famous poets of this early period are Nâbegha and others, whose works were translated and published by De Sacy in his *Chrestomathie Arabe*, and Kaab-ben-Zohair, who lived to celebrate the praises of the prophet Mohammed.

But Arabian literature began a new career with Mohammed, though his Korân contains not one precept favourable to literature or science. During the first eighty years of their conquests, when they had extended their dominion from Egypt to India, and from Lisbon to Samarkand, nothing can be said of their culture and refinement. A fanatical desire of conquest prevailed. Gradually, however, the taste for elegant pleasures arose during the repose that followed conquest, and the conquerors served themselves heirs to the civilization that was perishing around them. With the Abbaside khalifs, literature, science, and art arose (750 A.D.); when the khalifate fell (1258), they entered on their decline. They were generously fostered under the splendid sway, first of Almansor (754-75), and afterwards of the celebrated Haroun Al-Raschid (Harûn Al-Rashid, 786-808). Learned men were invited to their courts from many countries, and remunerated for their labours with princely munificence; the works of the best Greek, Syriac, and old Persian writers were translated into Arabic, and spread abroad in numerous copies. The Khalif Al-Mamûn, who reigned from 813 to 833, offered to the Greek emperor five tons of gold and a perpetual treaty of peace, on condition that the philosopher Leo should be allowed for a time to give him instruction. Under the sway of the same Al-Mamûn, excellent schools were founded in Bagdad, Basra, Bokhara, and Kufa; while large libraries were collected at Alexandria, Bagdad, and Cairo. In Spain, the high school of Cordova rivalled the literary fame of Bagdad, and generally, in the 10th century, the Arabs appeared everywhere as the preservers and distributors of knowledge. For this period of Arab glory corresponds exactly to that of Europe's deepest darkness, when Italy had no philosopher but the French pope, Sylvester II. (died 1003), whose learning, obtained from the Arabs of Cordova, earned him the name of necromancer. Pupils from France and other European countries then began to repair to Spain in great numbers, to study mathematics and medicine under the Arabs. There were fourteen academies, with many preparatory and upper schools in Spain, and five very considerable public libraries. When 300 volumes were a great library for a rich monastery, the library of the Khalif Hakem II. of Spain (died 977) contained, it is said, more than 600,000 volumes. This state of culture, when compared with that prevalent before Mohammed, shows a rapidity of

progress in knowledge almost as remarkable as the career of Arabian conquest.

The Arabs despised the languages of Greece and Rome, abhorred their poets for their heathenism, and disliked their temperate dignity of style; but in science the Arabs were willing learners, and rendered important services. Arabic words still employed in science—such as algebra, alcohol, azimuth, zenith, nadir, with many names of stars, &c.—remain as indications of their influence on the early intellectual culture of Europe. But geography owes most to them during the middle ages. Conquest, widened political connection, trade and the duty of pilgrimage, impelled them to this study. The old Arab treatises on geography, and works of travels in several countries by Ibn Fodhlân (died 921), the fugitive African calif, Edrisi (*circa* 1153), Ibn Jobair (died 1217), Abulfêda, prince of Hamath (died 1331), Ibn Batuta (died 1377), Albiruni the historian, and others, are still interesting and valuable.

Of what happened in the world before Islam, the Arabs cared to know nothing but the lives of the patriarchs and prophets, and a little of Persian history; but the history of the world after Islam arose was studiously cultivated. After the dawn of the 10th century, history became a favourite study of the Arabs. The first that attempted a universal survey of the subject were Masûdi (died 957), in his *Golden Meadows*; the Persian Tâbari (died 923), whose annals, of great bulk and value, were in 1887 in course of publication by De Goeje and others in Leyden; and Eutychius, Christian patriarch of Alexandria (died 950). These were followed by Abulfâraj or Bar Hebræus, philosopher and also theologian, 'the phoenix of his age'; and George Elmakin (flourished in Egypt in the 13th century), both Christians; Abulfêda; Nuwayri, who wrote a cyclopædia (*circa* 1331); Makrizi, who wrote the history of Egypt (died 1441), and others. See Wustenfeld's *Geschichtschreiber der Araber* (1882), and translations by Quatremère.

Arabian theology and jurisprudence are intimately connected, and both founded on the Korân; but are by no means so simple and uniform as is generally supposed. Speculation first began to prevail during the Omniade dynasty, and the Aristotelian philosophy to be studied by the Arabs. As a consequence, the vague statements of the Korân were soon variously interpreted, and a host of sects gradually arose. Of these, four only are regarded as orthodox, leaving not less than seventy-two heretical, whose discordant tenets are stated in the work of Shahrestani (trans. by Cureton, London, 1842). The four orthodox sects arose in the 8th century, and are: the Hanafites, who do not reject tradition, but subordinate it to reason; the Shâfiites, who entirely refuse the aids of reason and philosophy in their treatment of theology; the Kambalites and the Mâlechites, who allow speculation on points where there is no tradition. The collection of traditions known as the *Sunna* gives an account of the sayings and doings of Mohammed, and, though pedantic in its details, is in substance more valuable than the Korân. The interpretation of the Korân constitutes the principal part of education in theological jurisprudence. The most celebrated of the commentators are Zamâkshari, rationalistic, and Baidhâwi, orthodox. Consult Tornauw, *Das Moslemische Recht* (1885).

Arabian philosophy, which was of Greek origin, held the same relation to the Korân as the Scholasticism of the middle ages did to the Christian Scriptures—that is, it was regarded as the servant of faith. The chief study of the Arabs was the writings of Aristotle, who became known in Spain, and subsequently in all Western Europe, through

translations from Arabic into Latin; though the Arabs themselves only knew the Greek philosopher in translations made during the time of the Abbassides. Especial attention was paid to logic and metaphysics. The most distinguished of their philosophical writers are: the honoured leader, Alkindi of Basra, who flourished about the beginning of the 9th century; Alfarâbi, who wrote a work on First Principles in 954; Avicenna (died 1036), who combined the study of logic and metaphysics with that of medicine, and made considerable progress in chemistry, nosology, and medical botany; Alghazali (died in Bagdad, 1111); Abubekr-ibn-Tofail (died in Seville, 1190); and his pupil, Averroës, greatly esteemed as an expositor of Aristotle. For an account of these men and their systems, see *Sur les Écoles Philosophiques chez les Arabes*, by Schmolders (Paris, 1842); and Renan's *Averroës et l'Averroïsme* (1850).

Many of these illustrious Arabian philosophers were also physicians. The science of medicine is essentially a creation of the Arabs, to whom the oldest sources of knowledge—that of the Indian physicians—had been early opened. Chemical pharmacy (see ALCHEMY) was created by the Arabs. Pharmacy and *materia medica* naturally led to botany and chemistry. For three centuries—from the 8th to the 11th—a rich scientific culture prevailed. Schools of philosophy and medicine sprang up at Jondisahur, Bagdad, Ispahan, Firuzabad, Bokhara, Kufa, Basra, Alexandria, Cordova, &c. In all departments of medical science a great advance was made, except in anatomy (the Korân forbidding the dissection of human bodies). The most famous writers on medicine are Râzi (Rhazes) of Bagdad (c. 922); Alkindi; Avicenna (980-1037), who wrote the *Canon of Medicine*, for a long time the only handbook on the subject; Abulkasem of Cordova (died 1107); and Averroës (1126-98), who wrote a complete system of medicine.

In mathematics, the Arabs made great advances by the introduction from India of the numerals and mode of notation now in use, of the sine instead of the chord in trigonometry (thanks to Albatâni), and of a more extended application of algebra. While alchemists, searching for the elixir of life and the philosopher's stone, were founding chemistry, astrologers were enriching astronomy, which was zealously studied in the famous schools and observatories of Bagdad and Cordova. Alhazân wrote upon optics. The *Almagest* or System of Astronomy by Ptolemy was translated into Arabic as early as 812. In the 10th century, Albatâni, the greatest of Arabian astronomers, a Sabæan by religion, and born in Haran (died 929), observed the advance of the line of the apsides in the earth's orbit. Abul-Hassan-Ali wrote on astronomical instruments in the 13th century.

Besides these advances in the solid branches of knowledge, the genius of the Arabs continually flowered into poetry. Numerous poets sprang up in all lands where the children of the desert had carried their irresistible faith. Their verse, however, was not like the rude, simple minstrelsy of a purely patriarchal people; it gradually allied itself to the prevailing culture, and took, especially in the golden epoch of Arabian civilisation, a highly artistic form. None have been more highly esteemed than Motanebbi (killed 965) and Abutemâm (died 845), who compiled the old poems that compose the Hamâsah. Famous, too, are the satirist Abul-Ôlâ (died 1057), the Egyptian Busiri, whose *Bordâh* is a eulogy of Mohammed, and two Syrians, El-Rûmi (died 896) and the profound Ibn Fârid (died 1235; his *Divân* was published at Beyrout, 1874). Hamadâni (died 1007) introduced novels in rhyming prose like that of the Korân, and wrote four hundred of them

under the name of *Maqâmât*. Hariri (died 1121) brought this form of literature to perfection. Azzeddîn (died 1279) wrote an ingenious allegorical poem, 'The Birds and the Flowers.' Besides these, a singularly wild and fantastic prose literature made its appearance, in which the craving for the wonderful and gorgeous, so characteristic of the restless, adventurous Arabs, was richly gratified. Romances and legendary tales abounded. The most famous of these are: *The Arabian Nights' Entertainments* (q.v.), *The Exploits of Antâr* (pub. Buiâq, 1869), *The Exploits of the Champions*, and *The Exploits of Bibârs*. The taste for proverbs, fables, and biography was extensively indulged. In fact, with the exception of the drama, condemned by the Prophet, there was no sort of literature that the Arabs did not attempt. The trouveres of Northern France, the troubadours of Provence, the inspirers of Italy, and the romancers of medieval Europe owed much to the Arabs, whose influence on modern literature still endures. The tales of fays, charms, sorceries, and the whole gorgeous machinery of enchantment, passed into the poetry of the West. During the middle ages of European history, several of the most popular and widely-spread books came from or through the Arabs; such as *The Seven Wise Masters*, and *The Fables of Bidpai* (q.v.), though the Arabians themselves borrowed largely from Persian stories and Greek fables. See Clouston's *Arabic Poetry for English Readers* (1881); Nicholson's *Literary History of the Arabs* (1907; new ed. 1923).

All this culture of the early ages of Mohammedanism presents a strong contrast to the ignorance which now prevails among the Arabs. The brutal fanaticism of the Turks nipped the blooming promise of the East; sunk in stupid indolence, the peoples await in apathetic resignation their deliverance and return to higher modes of life. Literature furnishes now nothing worthy of notice. Learning spends itself principally in commentaries and scholia, in scholastic discussions on the subject-matter of dogmatics and jurisprudence, and in tedious grammatical disquisitions concerning the old Arabic speech, generally acute and subtle, but always unprofitable and unenlivening. The swift and mobile genius of the East has departed, and pedantic dullness has usurped its place. There are 'Dryasdusts' even in the desert. A few modern writers have attempted, with more or less success, to imitate European forms of thought and sentiment. Of these may be mentioned Michael Sabbagh of Syria; the Sheikh Refaa of Cairo; Nasîf-Effendi of Beirût, who wrote the critical observations in De Sacy's edition of Hariri (*Epistola Critica*, Leip. 1848); B. Bistâni in his cyclopædia (Beirût, 1875).

The Arabic also possesses a Christian and Jewish literature, which, however, is chiefly ecclesiastical. Its principal ornaments are Eutychius, Elmaktûn, and Abulfâraj. Translations of the Old Testament were made, not from the Hebrew, but from the Septuagint, or from Latin versions. In the middle ages, the Spanish Jews employed Arabic for their learned compositions; and several of the most important works of Moses Maimonides, for example, were originally written in that tongue. Consult on Arabian literature, D'Herbelot's *Bibliothèque Orientale*; Kremer's *Kulturgeschichte des Orients* (1875-7); Zenker's *Bibliotheca Orientalis* (1846-61); and Ibn Ishâq's *Kitâb-al-Fihrist*, the oldest Arab cyclopædia of literature, of about 1000 A.D., published by Flügel (2 vols. Leip. 1871-2).

The Arabic language, it has been remarked, is at once both rich and poor. It is necessarily destitute of innumerable words describing those ideas and objects which only civilisation can develop or produce; but, on the other hand, the rich and nimble fancy of the Arabians has multi-

plied, to an almost incredible extent, the synonyms of their desert-tongue, so that in some cases hundreds of expressions are found for the same thing. The Arabic belongs to the so-called Semitic family of languages, among which it is distinguished for its antiquity and soft flexible grace. Through the Koran, the dialect of an Ishmaelitic tribe, the Koreish, became the predominant language of literature and commerce throughout the whole extent of the Arabian dominions. The Himyaritic from Abyssinia, and closely akin to the ancient Ethiopic, is known as yet only by a few inscriptions, &c. Arab poems till 750 consisted mostly of from two to one hundred and twenty lines of one rhyme. Thereafter was developed an exact and complex prosody. Al-Jauhari, who died in 1009 A.D., drew up a dictionary of the pure Arabic speech, which he entitled *Al-Sihah* ('Purity'), and which is held in high estimation to this day. Mohammed-ben-Yakub-al-Firuzabadi, who died in 1414, was the author of an Arabic Thesaurus, entitled *Al-Kamūs* ('The Ocean'), which is the best lexicon in the language, and has consequently been translated into Persian and Turkish. Jordshani has explained, in alphabetical order, the meaning of the technical terms used in Arabic art and science. His work was published by Flügel (Leip. 1845), under the title of *Definitiones*. Meidani made a large collection of Arabic 'saws,' apophthegms, &c., which was published by Freytag (Bonn, 1838). Through the conquests of the Arabs in Sicily and Spain, their language became known in Europe; but notwithstanding the numerous traces of its influence in various European tongues, it became forgotten after the expulsion of the Moors from Spain. The first European scholars who earnestly took up the subject were the Dutch, in the 17th century; after them, the Germans, French, and English. The more learned theological students consider it a necessary part of their education. Maltese is an Arabic dialect, akin to the Mozarabic of the Spanish Moors. In Turkish plainly, and even in Malay, the traces of Arabic appear. In Persian every fourth, and in Hindustani every fifth word is Arabic. In recent times the purely negro population of the central and western Sudan have, in receiving Islam, made considerable progress in civilisation and the knowledge of Arabic. The Arabic language is never printed but in the ancient classical form, of which the Koran is regarded as the unapproachable standard. Classical Arabic is spoken in northern Central Arabia, differences increasing with distance. Elsewhere the language has lost, as Hebrew had lost before the oldest books of the Bible were written, the final vowels distinctive of case in nouns, and person in verbs. Egyptian or Syrian Arabic is less pure than the native, but more pure than the Arabic spoken from Tripoli to Morocco. Wright's *Arabic Grammar* (new edition) is one of the best extant; Lane's *Arabic-English Lexicon* is a standard work; and Badger's *English-Arabic Lexicon* (1881) is also excellent. The grammatical and lexicographical works of Caspari, Freytag, Fleischer, and De Sacy, are most important. See SEMITIC LANGUAGES.

Arabic Writing.—Like all Semitic writing, this proceeds from right to left. It is borrowed from the old Syriac, and was probably introduced into Arabia by Christian missionaries about the time of Mohammed. In its oldest form it is called Kufic, from the town of Kufa, on the Euphrates, where the transcription of the Koran was busily carried on. Its characters are rude and coarse, and it has particular symbols for only sixteen of the twenty-eight Arabic consonants. This writing, nevertheless, continued to be employed for 300 years, and for coins and inscriptions even later; but in the 10th

century it was displaced for common purposes by a current handwriting, the *Neskh*, introduced by Ibn Moka. This is the character still in use, more or less modified, by all nations that have adopted the Mohammedan religion. In it, the consonants which resemble each other are distinguished by points, and the vowels by strokes over and under the line; but in writing and printing, the vowels are commonly omitted.

The following passage, the translation of John iii. 16 as published by the British and Foreign Bible Society, will show the character (see also ALPHABET). It may be thus transliterated:

*Liannahu hakatha ahabb Allah el'alam hatta bathal
ubnahu elwahid lkar la yahlik kuul man yu'min
bhu bal takun lahu elhayyat elabadiyat.*

لأنه هكذا أحب الله العالم حتى بذل ابنه
الوحيد لكي لا يهلك كل من يؤمن به بل تكون
له الحياة الأبدية.

Arabian Nights' Entertainments (*Alf Laylah wa Laylah*, 'A Thousand Nights and a Night'), in Christian lands, the best known product of Arabian literature. The name and plan of this work are very ancient. Mas'udi in his famous history, *Golden Meadows*, written in 943, mentions the Persian Hezar Afsane, translated into Arabic with the name *A Thousand Nights and a Night*. Mohammed-ibn-Ishaq, in his work *Al Fihrist*, written in 987, mentions the Persian work as well known to him, and as containing about two hundred tales divided into a thousand nights. He thus relates its origin. A Persian king used to marry a new bride every day, and put her to death next morning. One wife was Shahrazad (Scheherazade), who had understanding and discretion. As they sat together she began a tale, and late at night she broke it off at such an interesting point that the king next morning spared her life, and at night begged her to continue her tale. So she did a thousand nights. Meantime she bore him a child. Presenting the child to him, she told him of the craft she had used; and the king, whose love she had now gained, admired her policy and let her live. Mohammed adds that the book was written for the Princess Homai, daughter of Bahman Artaxerxes, and that it had been translated into Arabic with alterations, some new tales being substituted for old.

The much-befabled Princess Homai is half mythical, like the Babylonian Semiramis, an accredited doer of many things whose author is unknown. Mas'udi tells that her mother was a Jewess whom Bahman had married, and who delivered her people from bondage: in short, she was the Esther of Israelitish tradition. But Persian poets and Arabian historians do not make it clear whether the name Shahrazad belonged to the mother or the daughter. Tabari calls Esther the mother of Bahman Artaxerxes (Longimanus); this is implied in the biblical story, as Ahasuerus seems to be Hebrew for Xerxes.

The occasion of the book written for the Princess Homai resembles the story told in the Hebrew Bible about Esther, her mother or grandmother, by some Persian Jew two or three centuries B.C. The likeness is closer between the biblical story and that of Shahrazad as it appears in the Arabian Nights, the surviving representative of the Persian *Thousand and One Nights*. In both, the Persian

king is offended with his queen; from the Persian book we cannot tell why; in the Hebrew, because she has insulted him at a banquet before his princes and lords; in the Arabian, for a fouler reason. In all three, thereafter, the king has a new wife daily. The Persian and the Arabic consign her next morning to death; the Hebrew merely to the seclusion of the harem. All three tell that the king at length honoured as queen the one that gained his lasting love; the Arabic makes her the grand-vizier's daughter; the Hebrew, the vizier's foster-daughter. The Persian ascribes to her her people's deliverance from bondage; the Hebrew, their salvation from massacre; the Arabic originates her hardy resolution to marry the blood-thirsty king in her zeal to save the daughters of her people. In all three the king is charmed at night with recitals from the past. In the Persian story she is aided by the king's housekeeper, in the Arabian by her own sister, in the Hebrew by the king's chamberlain.

A quotation by Makrizi from Ibn Saïd of about 1250, mentions the *Thousand and One Nights* as a romantic work. Meantime the work seems to have, in the course of centuries, had the experience of a celebrated pair of hose which lost their identity by universal patching, and to have been edited into its present form about 1450 in Egypt, and most probably in Cairo. How much of the Princess Homai's book remains in it we cannot tell, nor where to look for this remainder. The Persian origin of some of the tales is evident; equally evident the Indian origin of others, notwithstanding the location in Bagdad, and the presence of the Khalif Haroun Al-Raschid. But in a great part of the work both form and matter appear to be Arabian. The foundation of many tales in history or legend or older tales limits their age. The story of the city whose inhabitants are turned into fishes, the Christians into blue, the Magians into red, the Jews into yellow, the Moslems into white, cannot well be older than the year 1301, when the sultan of Egypt, to distinguish true believers from infidels, ordered Christians to wear blue turbans, and Jews yellow, while white turbans were reserved for Moslems alone. The story told by the purveyor of the sultan of Kashgar is taken, and considerably spoiled in the taking, from the Chronicle of Ibn-Al-Jauzi, who died in 1200. It is the story of Qamar, slave of the princess mother of Al Mogtadir, who was Khalif from 910 to 932. Others are traced by Mr Lane.

The *Thousand and One Nights* has never been patronised or protected by the literary classes of the East. The puritanical spirit of high Mohammedan literature demands an apology from any merely entertaining author for not better employing his time. The *Thousand and One Nights* accordingly bears the penalty of being neither religious nor scientific. Its style is mean; it has been much handed about in fragments among the comparatively uneducated; told by professional story-tellers so as to suit the rough audiences of Eastern towns; and copied from such men's dictation, individual taste or fancy filling many a blank.

Various editions differ considerably in the telling and order of the stories. The best are the not well-printed Bulak edition, the very similar but well-printed Calcutta edition of 1839, and the Breslau edition. No MS. appears to be older than 1548, the date of that used by Antoine Galland. His French translation, published in Paris, 1704-8, in 12 vols., was long supposed to be the fruit of his own imagination. It much misrepresents his original, and the Eastern life. Rendered into English, it became the most popular form of the *Thousand and One Nights* in Britain. He inserted into it ten tales of unknown origin; but in 1837

Burton found the Arabic text of two of these (including Aladdin) in a Parisian library. In 1840 E. W. Lane, prepared by several years spent in Cairo entirely among Arabs in the Arabian manner, published his scholarly translation, which spares us the coarseness of the original and much of its wearisome length. His notes are admirable. Payne's complete translation was published for subscribers, in 9 vols. 1882-84, and, according to Wright, Burton's biographer, was freely drawn on in Sir Richard Burton's translation, printed for subscribers in 10 vols. (1000 copies, at 'Benares,' 1885-87, with elaborate notes, excursions, and six volumes of supplement). The notes reveal extraordinary insight into Arabian life in its most fascinating and most revolting aspects. Lady Burton's edition of her husband's work, 'prepared for household reading' by J. H. McCarthy, omits only 215 out of 3215 pages (6 vols. 1888). E. P. Mathers (16 vols. 1923 *et seq.*) follows Dr Mardrus's French translation (1899 *et seq.*).

Arabian Numerals or CIPHERS—the characters 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Properly, they should be styled Hindu or Indian Numerals, for the Arabs borrowed them, along with the decimal system of notation, from the Hindus, probably in 773 A.D. (Herbert (afterwards Sylvester II.) seems to have learned the use of them from the Moors in Spain about the year 970. Yet their employment was not general before the invention of printing. Accounts continued to be kept in Roman numerals up to the 16th century. See NUMERALS.

Arabian Sea, the *Mare Erythraeum* ('Red Sea') of the ancients (though the term appears to have been applied vaguely), is that part of the Indian Ocean which lies between India and Arabia. Its most natural limit on the south is a line from Cape Comorin to Cape Guardafui. Its two great arms are the Red Sea proper and the Persian Gulf.

Arabin is the essential principle of gum-arabic, and is obtained pure by adding alcohol to a solution of gum-arabic in water, when the arabin is precipitated in white flocculi. See GUM.

Arabi Pasha (1841-1911) was born in Lower Egypt of Fellah stock, served in the Egyptian army, and under Tewfik rose to be minister of war, in which capacity he virtually set aside the Anglo-French control. Britain intervened, and Arabi, leader of the insurrectionary party, was defeated at Tel-el-Kebir (1882), and was exiled to Ceylon, whence he was permitted to return in 1901. Lord Cromer maintains Sir Auckland Colvin's opinion that Arabi's was not a merely military revolt, but a genuine Egyptian uprising against Turkish misgovernment. See EGYPT.

Arabis, a genus of small cruciferous plants, generally white-flowered. Five species (rock-cress, wall-cress) are British; others are grown in rockeries.

Arabistan (anc. *Susiana*), a border province of Persia, formerly called Khuzistan, at the head of the Persian Gulf. The north-east is very hilly; the south-west is so level as to be almost a stagnant sea in the rainy season, and an arid waste in summer. Arabistan contains extensive pastoral districts, and exports wheat, opium, and oil; also tobacco, wool, gums, dates, and almonds. Under the rule of the khalifs of Bagdad it was one of the richest provinces, and Ahwáz, the capital, acquired world-wide reputation for its sugar, carpets, and silks. The seat of the governor is Shuster (pop. 10,000); the port is Mohammerah; other towns are Dizful, Ahwáz, and Abadan. Of late Arabistan has assumed fresh importance through the reopening of navigation on the Karun (q.v.) and the development of the Anglo-Persian Company's oil-fields and works which supply the British Admiralty.

Arabkir. See ARABGIE.

Aracaju, a port of Brazil, capital of the state of Sergipe, on the Cotindiba, 6 miles from the sea, exports cotton and coffee; pop. 32,000.

Aracan. See ARAKAN.

Aracari, a genus of birds closely allied to the Toucans. See TOUCAN.

Ara'ceæ. See ARUM.

Arachis. See GROUND-NUT.

Arach'nida (Gr. *arachnē*, 'a spider'), a class of Arthropod animals, established by Lamarck for spiders, scorpions, and mites. These are still regarded as forming an important contingent of the class—namely, the orders Araneæ, Scorpionidea, and Acarina; but to these must be added the whip-scorpions or Pedipalpi, the harvest-men or Opiliones, the book-scorpions or Pseudoscorpionidea, and other orders. At a greater distance come the King-crabs (*Xiphosura*) and the extinct Eurypterids, at a still greater distance the extinct Trilobites, and many would also include in this heterogeneous class the strange nobody-crabs or sea-spiders (Pycnogonids).

The class does not form a very coherent unity, and a statement of general characters is consequently very difficult. In most cases there are two pairs of mouth-parts (chelicerae and pedipalps), four pairs of walking legs, no antennæ, a fusion of head and thorax into a cephalothorax, an abdomen without appendages, simple eyes, a curious internal skeleton called the endosternite, and not much in the way of metamorphosis. See *The Cambridge Natural History*, vol. iv.

Arachnoid Membrane, one of the three coverings which envelop the brain and the spinal cord, is situated between the dura-mater and the pia-mater; see BRAIN.

Arad, formerly capital of a district in Eastern Hungary, since 1920 part of Rumania, is situated on the right bank of the Maros, an affluent of the Theiss, and has a population (1911) of 63,166, including many Jews. It is an important railway centre, and is 95 miles S.E. of Budapest, and 74 miles E. of Szegedin by rail. It carries on a large trade in corn, spirits, wine, and tobacco, and is a great cattle-market. During the 17th century it was often captured, and at last destroyed by the Turks. During the revolutionary war of 1849 it was occupied for a time by the Austrians, who capitulated to the Hungarians in July. In August Arad was surrendered to the Russians by Görgei; many of the prisoners were massacred; and in October thirteen Hungarian officers were executed here by order of the infamous Haynau.—NEW ARAD, on the other side of the river, has 6000 inhabitants, including many Germans.—The county of Arad had an area of 2490 sq. m., with a pop. of about 500,000. It borders on Transylvania, and produces much excellent wine; the inhabitants are chiefly Rumanian in race, and most of it was assigned to Rumania in 1920.

Araom'eter. See AREOMETER.

Arafat, the purgatory of Islam, the place between Paradise and hell. Its position has not been defined with the usual exactness of Mohammed, but it is undoubtedly a place of purification by fire.

Ar'afat, MOUNT, *Orphat* or *Jebel-er-'rahme* ('mountain of mercy'), is a granite hill about 15 miles S.E. of Mecca, visited by the faithful, and believed to be the spot where Adam, conducted by the angel Gabriel, met again his wife Eve, after a punitive separation of 200 years, on account of their disobedience in Paradise. It is not above 260 feet high, but its circuit is a mile and a half.

Ar'ago, FRANÇOIS JEAN DOMINIQUE, a celebrated French astronomer and physicist, was born

February 26, 1786, at Estagel near Perpignan, in the department of Pyrénées Orientales. At the early age of seventeen, he entered the Polytechnic School at Paris, and in 1804 became secretary to the Observatory. Two years afterwards he was engaged, with Biot, by the French government, to carry out the measurement of an arc of the meridian, which had been commenced by Delambre and Méchain. Arago and Biot had to extend it from Barcelona to the Balearic Isles. The two savants established themselves on the summit of Mount Galatza, one of the highest of the Eastern Pyrénées, and here they lived for many months. War broke out betwixt France and Spain, and Arago was held to be a spy; his signals, supposed to be meant to guide the French invading army, were interrupted; and with great difficulty he succeeded in reaching Majorca. Having gone to Algiers, he was captured, on his way back to France, by a Spanish cruiser; and it was not till June 1809 that he finally arrived at Marseilles. As a reward for his sufferings in the cause of science, he was elected a member of the Academy of Sciences, though only twenty-three years of age, and was appointed professor of Analytical Geometry in the Polytechnic School.

His laurels were, however, won mainly in the fields of astronomy, magnetism, and optics. In 1812 he commenced his extraordinary course of lectures on astronomy and cognate subjects, which fascinated all Paris. In 1816, along with Gay Lussac, he established the *Annales de Chimie et de Physique*, and confirmed the truth of the undulatory theory of light. In 1818 he published his *Recueil d'Observations Géodésiques, Astronomiques, et Physiques*, and, with Biot, made geodetic observations on the coasts of England and Scotland. In 1820 he made several important discoveries in electro-magnetism—especially the phenomenon of *rotatory magnetism*. He may be said to have proved the relation between the aurora borealis and magnetic variations. He greatly promoted the acceptance of the undulatory theory of light, and made important advances in the doctrine of the polarisation of light. Other minor achievements were made in the department of photometric measurements of the brightness of the stars, the elastic force of steam and other gases. In 1830 he became chief director of the observatory, and received the post of Perpetual Secretary of the Academy. It was while holding the latter office that he wrote his famous *éloges* of deceased members. He took a prominent part in the July revolution (1830). Elected by Perpignan as member of the Chamber of Deputies, he occupied a position on the extreme left. In the revolution of 1848, he was chosen a member of the provisional government, and in this position he resisted the proposed measures of the Socialist party. Arago opposed Louis Napoleon, and refused to take the oath of allegiance after the *coup d'état* of 1852. He died 3d October 1853, and was honoured with a public funeral. His works were edited by Barral (17 vols. 1854-62), including the *Astronomie Populaire* and the *Notices Biographiques*. See Audiganne's *Arago, son Génie et son Influence* (2d ed. 1869).

JACQUES ÉTIENNE VICTOR ARAGO, brother of the great savant, was born 10th March 1790. In 1817 he accompanied an expedition round the world. Afterwards, we find him first at Bordeaux, and then at Toulouse, writing vaudevilles, besides publishing poems and romances. From 1835 to 1837 he managed the theatre at Rouen. His *Promenade autour du Monde* (1822), and *Souvenir d'un Aveugle* (1838), are well known. In 1849, though blind, he formed a company of speculators, and departed for California, to search for gold.

On his return he published *Unc Vie Agutée* (1853). He died in Brazil in January 1855.—ETIENNE, another brother of the astronomer, was born 9th February 1802, and made himself well known as a popular author. He held an appointment under the provisional government of 1848, and was afterwards exiled. In 1859 he returned to France, and in 1878 became archivist in the *École des Beaux Arts*. He died 5th March 1892.—EMANUEL, son of the astronomer (1812-96), became known as a zealous republican in 1848, and was after 1852 active as a barrister. In 1870 he became a member of the committee of national defence, and afterwards held appointments under the government.

Ar'agon, once a kingdom, now divided into the three provinces of Saragossa, Huesca, and Teruel, in the NE. of Spain. Greatest length from north to south, 190 miles; breadth, 130. Area, 18,000 sq. m. Population, 1,000,000. It is bounded on the north by the Pyrenees, and borders on Navarre, the Castiles, Valencia, and Catalonia. The Ebro flows through Aragon in a south-easterly direction, receiving numerous tributaries both from the lofty regions of the Pyrenees and from the Sierras in the south. The province is naturally divided into the level country along the Ebro, and the northern mountainous district of Upper Aragon. The central plain is sterile, poorly supplied with water, and intersected by deep ravines. The valleys of Upper Aragon are at once the most beautiful and fertile of all the Pyrenean valleys. The Spanish Pyrenees, which attain a height of over 11,000 feet, are rich in grand scenery, and afford good sport for the angler and sportsman. The slopes of the hills are clothed with forests of oak, beech, and pine. The minerals of the province are copper, lead, iron, salt, alum, saltpetre, coal, and amber. The silk-worm industry has been introduced. Aragon is peopled by a brave, active, enduring, obstinate race, high-spirited and patriotic, making good soldiers or audacious robbers. It early became a Roman province; and, on the fall of the empire, passed into the hands of the West Goths, but was conquered by the Moors in the beginning of the 8th century. The rulers of Aragon, after it had been recovered from the Moors and united with Catalonia (1137), became powerful; obtained possession of the Balearic Isles in 1213, of Sicily in 1282, of Sardinia in 1326, and of Naples in 1440. By the marriage of Ferdinand of Aragon with Isabella, heiress of Castile, in 1469, the two states of Aragon and Castile were united, and formed the foundation of the great Spanish monarchy. After Ferdinand's death in 1516, the union of the states was made permanent. The constitutional history of Aragon is peculiarly interesting for the stout defence of popular rights maintained by its cortes; even after the union with Castile, the old privileges were maintained. In the war with the French, 1808-9, Saragossa, the capital of Aragon, was remarkable for its heroic defence under Palafox. The chief towns are Saragossa, Calatayud, Huesca, and Teruel.

Ar'agon'a, a town of Sicily, 6 miles NNE. of Girgenti by rail, with the old castle of the princes of Aragona. Near it are important sulphur-mines. Population, 13,000.

Ar'agonite, a mineral essentially consisting of carbonate of lime, and so agreeing in chemical composition with calcareous spar, but differing from it in the form of its crystals, of which the primary form is a rhombic prism with angles of $116^{\circ} 16'$ and $63^{\circ} 44'$, the secondary forms being generally prismatic and pyramidal. The effect of heat on them shows another difference, aragonite being reduced to powder by a heat in which calcareous spar will remain unchanged. Aragonite

appears to be the product of a crystallisation taking place at a higher temperature than that in which calcareous spar is produced; and accordingly it is frequent in volcanic districts and in the neighbourhood of hot springs, as at Carlsbad. It is frequently found filling cavities (see AMYGDALOID), and lining cracks, joints, and other natural fissures in such igneous rocks as basalt and its varieties, porphyrite, &c. as in Scotland. It derives its name from the province of Aragon in Spain. It sometimes occurs in stalactitic form. Its crystals are sometimes prisms shortened into tables, sometimes they are lengthened into needles. Twin crystals (*maclés*) are very common. *Satin spar* is a variety of it, in which the crystals are of a fine fibrous silky appearance, and combined together into a compact mass. *Flos ferri* (i.e. flower of iron) is a name given to a coralloidal variety which sometimes occurs in iron mines.

Araguay', a large river of Brazil, rising in the Sierra Sciada, and flowing 1000 miles northward, till, at San Joao, it joins the Tocantins, which again, after a northerly course of 300 miles more, mingles its estuary with that of the Amazon round the Isle of Marajo.

Ar'akan (*Arakan*; also spelt *Aracan* and *Arracan*), long the most northerly division of Lower Burma, is a narrow strip of territory on the Bay of Bengal, between Pegu and Chittagong in Lower Bengal. Its length is about 400 miles, while its breadth varies from 90 miles in the north to about 15. The area is 14,526 sq. m. A range of mountains, nearly parallel with the line of coast, the highest point 7000 feet above the sea-level, separates Arakan from Pegu and Upper Burma. The soil of the northern portion of Arakan is alluvial; but the country is hilly, difficult of access, and covered with forest. Railway connection with Assam is projected. The division consists of four districts—Akyab, Sandoway, Kyaukpuy, and the Hill District of Arakan. At its annexation in 1826 the population was only about 100,000; in 1831 it was 173,000; in 1839 it had increased to 248,000; in 1872, 483,363; in 1881, 587,518; in 1891, 671,899; in 1901, 760,848; in 1911, 839,896. Trade has steadily developed. Rice is the chief article of exportation; the others are cotton, tobacco, sugar, hemp, indigo, betel-nuts, and timber, especially teak. The imports consist mainly of British manufactures.

The native princes of Arakan, whose history is traced back to the 8th century, once ruled over a much wider area. The old capital, Arakan, now called Myo-haung ('old town'), is situated 50 miles from the sea, in a very unhealthy district. It was the capital of a kingdom for 350 years, and its massive ruins of forts and walls still point to its former greatness. But its population has dwindled to less than 3000 souls. The modern capital of the province is Akyab (q.v.). The Arakanese belong to the Burman stock, and are Buddhists, though there are a few immigrant Mohammedans.

Aral, LAKE, in Central Asia, is separated by the plateau of Ust-Urt from the Caspian Sea. The largest lake in the steppes of Asia, it lies between $43^{\circ} 28'$ and $46^{\circ} 52'$ N. lat., $58^{\circ} 10'$ and 61° E. long., and has a surface area of nearly 25,000 sq. m. It is fed by the Sir-Darya (the ancient Jaxartes) on the NE. side, and the Amu-Darya (or ancient Oxus) on the SE. It has no outlet, and is generally shallow, the mean depth being 53 feet. On the west coast it reaches a depth of 223 feet; but it shoals gradually eastward to a mere marshy swamp. Its level varies (160 feet above sea-level and 250 above the Caspian in 1900). It is brackish, but, as its waters rise, its salinity (about 1 per cent. in 1900) is decreasing. Fish, including sturgeon,

carp, and herring, are abundant. The lake is dotted with islands. Its shallowness and exposure to fierce, sudden storms from the NE. render navigation (which dates only from 1847) difficult. The Orenburg-Tashkand railway passes its northern end. Its history and geography present many problems. It has been argued that within historical times the lake has more than once dried up, the Jaxartes and Oxus then emptying themselves into the Caspian. In 1717 Peter the Great sent an ill-fated expedition to try to divert the Oxus towards the Uzboi depression (its supposed old bed) and the Caspian, a project long entertained in Russia. L. S. Beig, as the result of investigations, 1899-1906, concluded that the Aral Sea was at one time united with the Sary Kamich lake to the south; that it communicated with the Caspian by the Uzboi depression; that under certain weather conditions the Oxus may branch off to the Caspian, as may have happened in the 13th-16th centuries; and that if the Aral rose 13 feet above its level of 1900, it would overflow towards the Caspian. Considerable differences in level have been recorded in recent times (1785-25—fall; 1835-50—rise; 1860-80—fall; since 1885—rise). Unlike the Caspian, it did not begin to fall after 1896. It was 4 feet higher in 1900 than in 1874.

Aralia, a genus of plants, the type of the Araliaceæ, an order allied to the Umbelliferae less developed in inflorescence, which is often racemose-umbellate, and in fruit, which has usually more than two carpels, and is often succulent—witness the berries of the common ivy. The order contains about 400 known species, natives of tropical, temperate, and cold climates, generally possessing stimulant and aromatic properties. Poisonous qualities are not developed as in the Umbelliferae. The herbage of many species affords good food for cattle, and some are used for human food. The genus *Aralia* contains a considerable number of species—trees, shrubs, and herbaceous plants. *A. nudicaulis* is sometimes substituted in the United States for sarsaparilla; and *A. racemosa*, *A. spinosa*, and *A. hispida*, all natives of North America, produce an aromatic gum resin. *A. spinosa* is a diaphoretic stimulant. The berries, infused in wine or spirits, are employed in America as a cure for rheumatism. It is sometimes called Toothache-tree: it also bears the name of Angelica-tree. It is a native of moist woods in Virginia and Carolina, growing to a height of 10 or 12 feet, with a single stem, spreading head, doubly and trebly pinnate leaves and ovate leaflets, and is very ornamental in a lawn. *A. polaris*, found in the southern island of New Zealand, described by Hooker as a very magnificent plant, is a herbaceous perennial, 4 to 5 feet high, with large orbicular masses of green foliage and waxy flowers, presenting a very striking appearance. *A. edulis*, now called *Dimorphanthus edulis*, is employed in China as a sudorific. Its shoots are very delicate and pleasant when boiled; and the roots, which have an agreeable aromatic flavour, are used by the Japanese as carrots or parsnips are in Europe. Aralias abound in the warm valleys of the Himalaya. The natives collect the leaves of many as fodder for cattle, for which purpose they are of great value in a country where grass for pasture is scarce; but the use of this food gives a peculiar taste to the butter. Chinese rice-paper is cut from cylinders of the pith of an aralia. Ginseng (q.v.), the root of a species of *Aralia*, is one of the most important products of the order Araliaceæ. But it is upon their remarkable value as decorative plants that the interest and cultivation of the group increasingly depends. The only representative of this order in the British flora is the Ivy (q.v.).

Aram, EUGENE, was born in 1704 at Ramsgill, in Yorkshire. Though but the son of a poor gardener he contrived to acquire considerable learning, married early, and became a schoolmaster, first in Nidderdale, and afterwards at Knaresborough, where he became intimate with one Daniel Clarke, a shoemaker. The sudden disappearance of the latter in 1745, at a time when he happened to be in temporary possession of a quantity of valuable goods, threw suspicion upon Aram, not as Clarke's murderer, but as his confederate in swindling the public. His garden was searched, and in it was found a portion of the missing property. Aram was arrested and tried, but acquitted for want of evidence. He now left his wife at Knaresborough, acted as a schoolmaster at various places in England, acquiring, in spite of his nomadic mode of life, a knowledge of botany, heraldry, Chaldee, Arabic, Welsh, and Irish. He had already amassed considerable materials for a Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic languages. His secret was betrayed by a confederate, who excited suspicion by the loudness of his protestations that a certain skeleton that had been found near Knaresborough was not that of Clarke. The accomplice was at last driven to confess where the murdered man had been buried; the bones were exhumed and identified, and Aram was suddenly dragged from his usher-ship at Lynn Academy in Norfolk, and thrown into prison on a charge of murder. He was tried at York, 3d August 1759, and sentenced to be hanged within three days. At the trial he conducted his own defence, attacking with great acumen, plausibility, and curious erudition, the doctrine of circumstantial evidence. After his condemnation, he confessed his guilt, wrote a defence of suicide, but failed in an attempt to illustrate his essay. A factitious interest has been attached to Aram's miserable story from Lord Lytton's overpraised romance and Hood's powerful ballad. See E. R. Watson, *Eugene Aram, his Life and Trial* (1913).

Aramaic (from the Hebrew word *Aram*, signifying the 'highland,' in opposition to the lowland of Canaan) includes the whole of the country situated to the NE. of Palestine. It embraced the countries known to the Greeks by the various names of Syria, Babylonia, and Mesopotamia. The *Aramaic language*, a branch of the Semitic, was common to the whole country, and was divided into two principal dialects—the West Aramaic or Syriac, and the East Aramaic, or, as it is improperly termed, the Chaldee. The former was that spoken almost universally in Palestine in the time of Christ. After the Babylonian captivity, the pure Hebrew, in which the whole of the Old Testament, with the exception of a few chapters in Daniel and Ezra, had been written, gradually gave place to the Aramaic. It was the common tongue of Palestine in the time of Jesus, and his quotations from the Old Testament are from an Aramaic version rather than from the original Hebrew; as, for instance, the beginning of the 22d Psalm, which he repeated on the Cross; while all the Semitic words that occur in the New Testament, as well as in Josephus, are also Aramaic, as *Mammon*, *Raka*, *Eli*, *Eli*, &c.; *Talitha kumi*, *Abba*, &c. The Talmud, especially the Babylonian, has a large admixture of Aramaic elements, while the Targums are entirely composed in this idiom. The Aramaic dialect is, in general, the harshest, poorest, and least elaborate of all the Semitic languages, and has now almost entirely died out and given place to the Arabic and Persian. In respect of development it stands midway between classical Hebrew and modern Arabic, having lost the severe simplicity of the one without gaining the flexible variety of the other. See SEMITES and TARGUM.

Aran, SOUTH ISLES OF, Ireland. These are three small islands lying N.E. and S.W. across the entrance to Galway Bay. Total area, 11,287 acres. The principal or west island, Inishmore or Aranmore, is 7 miles long and 2 broad; Inishmaan, or 'Middle Isle,' comes next; and then Inishere to the S.E. The islands consist of carboniferous limestone, and rise to the height of from 200 to 354 feet on the west side, ending in cliffs facing the Atlantic. Most of the land is rudely cultivated. Inishmore is still known as *Aran-na-naomh*, or 'Aran of the Saints,' and many pilgrims still visit the old shrines and remains of churches scattered through the islands, as also the little beehive stone huts of the monks of the 6th and 7th centuries. There are several circular cyclopean fortresses of unheun uncemented stones, of which the largest is Dun-Aengus, on Inishmore. Pop. 2700, mostly on Inishmore. See books by Burke (1887) and Syngé (1907).

Aranda, PEDRO DE BOLEA, COUNT OF, born in 1718 of a distinguished Aragonese family, at first embraced a military career, but was appointed ambassador to the court of Poland (1759), governor of Valencia (1763), and president of the Council of Castile (1766). Aranda not only soon restored order in the capital, but limited the power of the Inquisition, procured the expulsion of the Jesuits from Spain, and suppressed the banditti of the Sierra Morena. In 1773 he was removed from his high position through the influence of the clergy, and sent as ambassador to France. Recalled in 1792, he had soon to retire to his own estates, where he died in 1799.

Aranea and **Araneidæ**. See SPIDER.

Aranjuez (probably the Latin *Ara Jovis*), a town of Spain, on the left bank of the Tagus, 30 miles S.S.E. of Madrid by rail, in a beautifully wooded valley. The town is regularly built, with broad streets intersecting each other at right angles. The palace was long a favourite spring-resort of the royal family, and was altered and added to by successive sovereigns from Charles V. downwards. The famous gardens were laid out by Philip II.; their most splendid ornament are the great elm-trees brought from England by Philip II., which radiate from a central plot in twelve avenues. At Aranjuez was concluded a treaty between France and Spain in 1772, and it was also the scene of the abdication of Charles IV. in 1808. When the court was here, the pop. used to reach 20,000; now it is about 14,000.

Arany, JÁNOS, next to Petöfi the most distinguished of modern Hungarian poets, was the son of a poor peasant, and was born at Nagy-Szalonta, 2d March 1817. In 1832 he entered the college at Debreczin, but in 1836 joined for a time a company of strolling-players. Settled at Szalonta, he worked as a teacher and as a notary. When the Kisfaludy Society offered a prize for the best humorous poem, his *Lost Constitution* obtained the prize. In 1847 he forwarded to the same society his *Toldi*, a national trilogy, which made the poet a popular favourite. In 1848 appeared his *Conquest of Murány*, which, however, was not so successful. He took a slight part in the revolution, but after the war was allowed to return to his country. He was afterwards professor of Hungarian literature, director of the Kisfaludy Society, editor of a journal, and secretary of the Hungarian Academy (1865-70). Later works are *Katalin*, a continuation of *Toldi*, two volumes of lyrics, *Buda Halála*, and a humorous poem recounting his early adventures (1874). Part of *Buda* has been translated into English. He died 22d October 1882.—His son LÁZSLÓ (born 24th March 1844) is also noted as a poet and translator of Shakespeare.

Arapaim'a, a genus of tropical fishes, including the largest known fresh-water forms. They are found in the rivers of South America, and are sometimes taken in the Rio Negro, 15 feet in length, and 4 cwt. in weight. They are shot with arrows or harpooned, and are highly esteemed as food; salted, they are conveyed in large quantities to Para. The genus *Arapaima* belongs to the family Osteoglossidæ, allied to the Clupeidæ or herring, and is remarkable for the mosaic work of strong bony scales with which the body is covered. The head is also protected by bony armature. Osteoglossum and Heterotis are closely related genera, found in various parts of the tropics.

Ararat (Armenian *Airarat*), a general old name for the district through which the Aras flows, and never the name by which the Mount of Ararat has been known to the people around it. Associated, however, as the mountains of this district are in Genesis, viii. 4, with the landing-place of the ark after the flood, the name has been, naturally enough, appropriated to the highest peak, which in Armenian is called Massis or Massis Ljarn; in Tatar and Turkish, Aghri-Dagh, or curved mountain; and in Persian, Koh-i-Nuh, or Noah's mountain. The Chaldee legend, on the other hand, fixed the spot of Noah's landing in Gordyene, N.E. of Nineveh and Mosul. The twin mountains of Ararat form an elliptical mass, 25 miles long from S.E. to N.W., by half that breadth, rising on the N. and E. out of the alluvial plain of the Aras, 2500 to 2800 feet high. The mass stands quite isolated on all sides but the N.W., where a column 7000 feet high connects it with a long ridge of volcanic mountains extending westwards. From confluent bases of common level, 8800 feet high, the two peaks, both of entirely igneous formation, shoot upwards, Great Ararat to 16,969 feet, Little Ararat to 12,840 feet above the sea-level; the two summits 7 miles apart. From their isolation and bareness, the two peaks are very impressive—Little Ararat as an elegant cone of steep, smooth, regular sides; Great Ararat as a huge, broad-shouldered dome, supported by strong buttresses. The limit of perpetual snow rises in Ararat to nearly 14,000 feet. On the N.E. side of Great Ararat is a remarkable chasm, 9000 feet deep, surrounded by monstrous precipices. There is a similar, but smaller, chasm on the S.W. side. Ararat is singularly bare; the only wood of any extent, on the skirts of Little Ararat, at 7500 feet high, consisting of low birches. Ararat is perfectly dry throughout. Yet the mid-zone, from 5000 to 12,000 feet, is covered with good pasture, over which the Kurds wander in summer with their flocks. Below this mid-zone, Ararat has a steppe vegetation of dwarf prickly shrubs, and is unploughed and uninhabited. The top, at least during summer and autumn, is perfectly clear throughout the night, and till sometime after dawn. From 3 or 4 A.M., however, till sunset, clouds hang around Ararat for 3000 feet from the top. The view from the summit of Ararat, which towers over his neighbours much more than does Mont Blanc or Elburz, is singularly grand: there is the Caucasus, 280 miles away in the north; the dim plain of Erivan at the bottom; the extreme ranges of Taurus in the west; and a wilderness of bare red-brown mountains to the south and south-west. In 1828 the Tsar Nicholas annexed the territory around Erivan; and Little Ararat became the meeting-point of the Russian, Turkish, and Persian empires. On the 20th of June 1840 dreadful shocks of earthquake were felt. Great masses of the mountain were thrown into the plain, a ravine was closed, a convent and chapel disappeared, and the village of Arguri, and the gardens which

surrounded it, were buried under rocks, earth, and ice. Tournefort made a partial ascent of the mountain in 1700; since then, ascents have been made in 1829 by Professor Parrot of Dorpat: in 1850 by Colonel Chodzko, and a large party of Russians engaged in the Transcaucasian triangulation; in 1856 by Major Robert Stuart; in 1870 by Dr G. Radde and Dr G. Sievers; and in 1876 by Professor Bryce.

See ARMENIA; a long article in *Petermann's Mittheilungen* for 1871; Bryce, *Transcaucasia and Ararat* (1st ed. 1896); Lynch, *Armenia* (1901).

Aras (the ancient *Araxes*), the chief river of Armenia, rises near Erzerum, and flows rapidly eastwards past Ararat (q.v.) for over 500 miles into Kizilagatch Bay in the Caspian, passing through or along the borders of Armenia, Azerbaijan, and Persia. Until the end of the 19th century it was a tributary of the Kur. Cotton is grown along its course, and since 1906 much land has been reclaimed by irrigation in the Mugan Steppe between it and the Kur, with which an arm still links it.

Aratus of SICYON, a distinguished Greek statesman, was born about 271 B.C. He liberated Sicyon from its tyrant, Nicocles, in 251, and united it with the Achaian League, of which he was appointed general in 245. Under him the league grew in influence. His great object was to unite the Greek states, and form out of them an independent nation; but this was thwarted by their mutual jealousies and wars. The league ultimately fell under the power of Macedonia. Aratus was a brave general, a skilful tactician, and a disinterested patriot. According to Plutarch, he was poisoned in 213 by command of Philip III. of Macedon.

Aratus of SOLI (or Pompeiopolis, in Cilicia), a physician and poet of noble birth, a contemporary of Callimachus and Theocritus, lived mostly during the latter part of his life at the court of Antigonus Gonatas of Macedonia, at whose instance he wrote, about 270 B.C., his astronomical poem, *Phænomena*. This was founded on the astronomical system of Eudoxos of Cnidos, and consisted of 732 verses. He appended to it another poem, *Diosemeia*, giving rules for prognostication of the weather. A pure style and correct versification mark both poems, but they lack originality and elevation. They were translated into Latin by Cicero, Caesar Germanicus, and Festus Avienus (q.v.). Aratus was a native of the same province as St Paul, who quotes from him in his speech on Mars' Hill: 'For as certain of your own poets have said, We also are his offspring.' The best editions are by Buttmann (1826), Bekker (1828), and Köchly (1851); and there is a translation of the *Phænomena* into English verse by Robert Brown (1885).

Araucania, the country of the Araucos or Araucanian Indians, in the south of Chile. The province of Arauco (2500 sq. m.; pop. 60,000), lying between the Andes and the Pacific Ocean, and bounded on the north by Concepcion, on the south by Valdivia, was formed in 1875, and has plentiful coal-deposits in the north. A large part of Arauco and of the neighbouring province of Valdivia, is occupied by Indians, who have for some time mostly submitted to Chilean authority. The Araucanians are interesting as furnishing the only example of Indian self-government in the presence of the European races. They are a fierce and warlike people, and have a kind of military aristocratic constitution. Formerly the government rested in the hands of four chiefs (*Toquis*), each nominated by one of the four divisions of the people, and one of whom was elected 'great Toqui.' They have no formal laws, but custom and tradition have all the force of these. They do not

now number more than 50,000. Their country is divided from north to south into four parallel regions, with varying soil and climate. These are the coast region, the plain region, the region of the Lower Andes, and the region of the Higher Andes. Araucania has the proud distinction of being the only portion of the New World that has never received the European yoke. From the days of Pizarro and Almagro downwards, it has uniformly vindicated its freedom—its wars of independence having lasted, with intervals of precarious truce, from 1537 to 1773. In 1861 a French adventurer, Tounens by name, ingratiating himself with the Indians, was elected king of Araucania. Soon at war with Chile, he was captured and allowed to go to France. Returning to Araucania, he kept up a struggle with the Chileans in 1869-70, but from 1871 he posed in France as a dispossessed king, and died in 1878.

See CHILE, and books there cited; Tounens, *L'Araucanie* (1878); Smith, *The Araucanians* (New York, 1855); Medina, *Los Aborígenes de Chile* (1882); *Macmillan's Magazine*, August 1891; and Polakowsky, 'Die heutigen Araukanen,' in *Globus*, No. 74 (1898).

Araucaria, a genus of evergreen conifers, consisting of lofty trees, natives of South America and Australasia. *A. imbricata*, called also Chile Pine, Monkey-puzzle, or Puzzle-monkey, is a native of

Branch of *Araucaria imbricata*.

the Andes of Chile, forming forests on their western declivities, where it attains a height of 100 to 150 feet. The trunk is quite straight and free from knots, and yields abundant resin. Like many pines, the young trees have branches almost from the ground, but the older ones have tall naked stems with a crown of branches. The timber is heavy, solid, hard, fibrous, yellowish white, and beautifully veined. It is very suitable for masts of ships. The resin, which is white, has a small like frankincense, and a not unpleasant taste. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food to the Indians. The generic name is derived from that of a tribe, the Araucanians, who especially use it as food, raw, boiled, or roasted. A spirituous liquor is also distilled from it. A single cone sometimes contains between two and three hundred seeds, and one tree may be seen loaded with twenty or thirty of these. This araucaria was introduced into Britain in the end of the 18th century, and is now frequently planted, especially in small villa gardens, for which its stiffly symmetrical and unvaried form is, however, peculiarly unsuitable. It is the only species which can at all withstand the climate of Britain. It requires a well-drained soil, and is apt to suffer in severe winters. *A. brasiliana*, the Brazil pine, has a

looser and more spreading habit than *A. imbricata*. The seeds are sold as an article of food in Rio Janeiro, and the resin which exudes from the tree is mixed with wax to make candles. *A. excelsa*, the Norfolk Island pine, attains a height of 160 to 220 feet, free from branches to 80 to 100 feet, and with a trunk sometimes 11 feet in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. Diminutive specimens are seen in rooms. *A. Cunninghamii*, the Hoop Pine, a native of New South Wales, very much resembles the last. It attains a height of 60 to 130 feet, and a diameter of 4 to 8 feet. The wood is yellowish, and is used for boat-building, house-carpentry, and the common kinds of furniture. The large seeds of *A. Bidwillii* are used for food by the natives at Moreton Bay.

Certain fossil Coniferae found in carboniferous sandstone have received the names Araucarites, Araucarioxylon, &c., and are closely allied to the existing forms, which, in fact, represent far more nearly than do any other trees the primitive forms of the palæozoic age. Livingstone found such fossils in abundance on the Zambesi, and great trees of this type are not uncommonly discovered in the carboniferous quarries around Edinburgh.

Arauco. See ARAUCANIA.

Araurê, a town of Venezuela, South America, 60 miles ENE. of Truxillo, in a region noted for its fertility in the production of cotton, coffee, cattle, &c.; pop. about 10,000.

Aravalli, a range of mountains in Western India, extending for 300 miles in a north-easterly direction through Rajputana. They consist of a series of ridges and peaks, many of them mere heaps of sand and stone, bare of cultivation. The highest summit is Abu (q.v.), 5650 feet.

Arawak ('meal-eaters'), a tribe of South American Indians inhabiting British and Dutch Guiana and adjacent regions, cultivators of manioc and maize, comparatively advanced in civilisation. Kindred tribes extend over much of northern South America.

Araxes. See ARAS.

Arbalet. See CROSSBOW.

Arbela, now Erbil or Arbil, a small town of Assyria, east from Mosul, famous as having given name to the battle in which Alexander finally defeated Darius, 331 B.C. The battle was really fought near Gaugamela (the 'camel's house'), to the NW. of Arbela.

Arbitration is the adjudication by private persons appointed to decide a matter or matters in controversy. The proceeding generally is called a reference or submission to arbitration; the persons appointed to decide are termed referees or arbitrators; and their decision is called an award. This mode of settling disputes is frequently resorted to by the disputants themselves, who are anxious to avoid the delay and expense of proceedings in the ordinary courts of law; and it is with this class of arbitration that this article is mainly concerned. But an arbitration may also be brought about under the order of a court of law. Thus, in England, the High Court, in any civil action pending before it, has large powers to refer—in some cases with the consent of the parties, and in other cases without such consent—either the whole matter or some particular question arising in the action to a referee or arbitrator, whose authority is derived from the order of the court directing the reference; and the judge in a county court is also empowered, with the consent of the parties, to refer to arbitration an action pending before him. Moreover, in recent years the growth of public opinion in favour of this method of deter-

mining differences has been so great that many modern acts of parliament contain provisions for the settlement of disputes on particular matters by means of arbitration. Under some of these statutes procedure by arbitration is compulsory; under others it is at the option of the parties or one of them. Thus arbitration is compulsory in the case of certain disputes relating to agricultural holdings (63 & 64 Vict. chap. 50), factories and workshops (1 Edw. VII. chap. 22), the housing of the working-classes (53 & 54 Vict. chap. 70), and workmen's compensation (6 Edw. VII. chap. 58). An option of arbitration is given by various statutes in case of differences arising in connection with, *inter alia*, the following matters: the accounts of municipal corporations in England and Wales; dangers existing in a coal-mine, or arising from the practices or special rules obtaining in the mine; friendly societies; the administration of public health and local government; and, most important of all, the taking of land for railways, tramways, waterworks, harbours, cemeteries, electric lighting, military uses, and other undertakings of a public nature.

In England the law as to arbitrations is now to a large extent embodied in the Arbitration Act, 1889 (52 & 53 Vict. chap. 49), which is practically a code on this subject. The act deals separately with 'references by consent out of court,' and 'referencees under order of court.' It also applies to every statutory arbitration, compulsory or optional, except in so far as its provisions are inconsistent with those of the particular statute regulating the arbitration in question.

A reference by consent out of court has its origin in a private agreement, termed a submission, by which two or more parties, between whom some dispute has arisen or may thereafter arise, agree to be bound by the decision of an arbitrator upon the matters in dispute. The authority of the arbitrator is derived from, and limited by, the submission. At common law a submission may be constituted by an oral agreement by the parties. But where the submission is oral the arbitration does not come within the provisions of the Arbitration Act, 1889. Consequently, in addition to other obvious disadvantages attending a parol submission, an arbitration so brought about, being governed solely by the common law, is exposed to the risk of being rendered abortive by either party revoking the authority of the arbitrator at any time before the award is made, and the award, when made, cannot be enforced except by action. Hence a submission is almost always constituted by a 'written agreement'; and where the submission is in that form, the whole arbitration is governed by the act, whether an arbitrator is named in the submission or not. If a written submission does not name an arbitrator or give directions for his selection, the act provides means whereby, in the event of the parties failing to concur in making the appointment, either of them can have an arbitrator appointed by the court. Again, under the act a written submission, unless a contrary intention is expressed, cannot be revoked except by the leave of the court; and such leave is not granted unless it is shown that the arbitration, if allowed to proceed, would fail to achieve the true justice of the situation between the parties. We shall therefore consider the case of a written submission to which the act applies.

The matters that may be referred to arbitration include all differences or disputes which might otherwise be determined by a court of civil jurisdiction or be settled by a valid agreement between the parties themselves. The matter in dispute may relate either to real or to personal property, and may turn either on questions of fact or on questions of law. Parties may agree to refer to

arbitration not only existing differences between them, but also prospective differences. Thus in deeds of partnership, policies of insurance, and other instruments of contract, it is frequently stipulated that if any disputes shall arise thereunder they shall be referred to arbitration. On the other hand, where a dispute arises out of a transaction which is clearly illegal or contrary to public policy, it cannot be the subject of an arbitration; for it could neither be determined in a civil court nor could a compromise, or agreement for its settlement made by the parties themselves, be enforceable at law. On the same principle felonies and criminal offences of a public nature are not arbitrable; for, in the public interest, such crimes require to be punished, and no settlement which the injured party might make with the accused offender would afford the latter any legal immunity. But in the case of certain misdemeanours, e.g. an ordinary assault or a charge of slander, where the wrong-doer is liable to a criminal prosecution and also to a civil action at the instance of the injured party, the law, even when a criminal prosecution has been commenced, permits an arbitration for the adjustment of the reparation to be made to the injured party.

As to the persons who may be parties to an arbitration, it may be stated generally that every person capable of making a contract may enter into a binding submission to arbitration. Thus a married woman, in virtue of the contractual powers conferred on her by the Married Women's Property Acts, is now capable of making a submission with regard to her separate estate. Where an infant or person under age enters into an arbitration, it would seem that, as in the case of many of his other contracts, he may, on attaining majority, elect either to execute it or avoid it, and the award is not enforceable against him during his infancy. A partner has no implied authority, in virtue merely of the relation of partnership, to bind his firm by a submission to arbitration; but a submission by one partner is binding on the firm if it is proved that the reference was for the purposes of the partnership business and was the usual way of carrying on such business, or if there is evidence that the reference was entered into with the knowledge or assent of the other partners. An agent may be authorised to enter into a submission on behalf of his principal; and, in that event, the award is binding on the principal alone and not on the agent, unless the latter expressly binds himself. The general authority which a counsel has over the conduct of an action does not empower him to refer the action to arbitration against the wishes of his client or upon terms different from those which his client has authorised; and if he does so refer it, the reference may be set aside. Executors, trustees, trustees in bankruptcy, and companies registered under the Companies Acts are expressly empowered by statute to submit disputes to arbitration.

A submission does not necessarily bar legal proceedings; but if a party to the submission brings an action against the other party in respect of any matter which they have agreed to refer to arbitration, the court may, on the application of the other party, stay the action. The application may be made after the applicant has entered an appearance; but it must be made before he has taken any other step in the action. The court will stay the action, unless it is satisfied that there is a sufficient reason for the matters in dispute not being decided by arbitration in accordance with the submission.

The arbitrator ought to be a person who stands indifferent between the parties. The choice by the parties of the person whom they appoint to decide between them is perfectly free. Time and expense,

however, are often saved by the appointment of a person who, by reason of his knowledge of law and his experience of judicial investigations, is able to confine the inquiry strictly to the matters in question, to estimate the evidence properly, and to avoid irregularities in respect of which the award might afterwards be set aside. A reference, unless a contrary intention is expressed in the submission, is deemed to be to a single arbitrator, and, if the submission contains no provisions for his appointment and the parties do not concur in making an appointment, the court may appoint the arbitrator. Where an arbitrator, whether agreed on by the parties or appointed by the court, refuses to act, or is incapable of acting, or dies, the court has power to supply the vacancy in the event of the parties themselves not concurring in making a new appointment. If a submission provides that the reference is to be to two arbitrators, one to be appointed by each party, and if one of the parties refuses to appoint his arbitrator, after being served with a seven days' notice by the other party, the party who has already nominated his arbitrator may appoint him to act as sole arbitrator. Where there are two arbitrators, the submission often provides that, in the case of their not agreeing in an award, the matter referred shall be decided by a third person, called an umpire. If the umpire is not named in the submission, the arbitrators themselves, even though they are not specially authorised to do so by the submission, have power to make the appointment at any time within the period during which they can make an award; and if they do not appoint an umpire, or he refuses to act, the court may appoint one. The umpire, if the arbitrators fail to agree, is substituted for them and is invested with the same powers. His duties, properly speaking, do not arise till the arbitrators are unable to agree; but in practice he usually sits with the arbitrators from the commencement of the proceedings, as, otherwise, all the evidence would have to be repeated before him. Sometimes a submission provides that the reference is to be to three arbitrators, as distinguished from two arbitrators and an umpire; but in that case, unless the submission bears that an award by a majority of the arbitrators shall be binding, the award is bad unless signed by all three arbitrators.

The proceedings before an arbitrator should be conducted, so far as may be practicable, in conformity with the rules observed in the trial of an action in a court of law, and an arbitrator is bound by the same rules of evidence as courts of law (*in re Enoch*, 1910, 1 K.B. 327). He may examine the parties to the reference and their witnesses on oath or affirmation, and compel the production of documents in their possession relating to the matters in dispute. Any person giving false evidence is guilty of perjury, and may be punished as if the evidence had been given in court. The arbitrator must hear both sides and take evidence in the presence of both parties. If a question of law arises in the course of the reference, he may, on his own initiative or at the request of either party, 'state a case' for the opinion of the court; and if he refuses, at the reasonable request of either party, to state a case, an application may be made to the court to compel him to do so. The application to the court must be made before the arbitrator makes his award; but if he, after being requested to state a case, refuses to do so without reasonable grounds and makes his award before an application to the court can be made, the award may be set aside by the court.

The award must be in writing, and is chargeable with ten shillings stamp-duty (6 Edw. VII. chap. 20, sect. 9). Where the submission itself does not fix the time within which the award is to be made, arbi-

trators must make the award within three months after entering on the reference; but, during that period, the time for making their award may be enlarged by a writing signed by them. Where the power of making the award devolves on the umpire, he must make his award within one month after the time of the arbitrators has expired, unless he has meantime, by a signed writing, extended the time for making his award. The time for making the award may be extended by the express consent of the parties to the submission, or, even after the time has expired, by order of the court. The award must decide all the matters referred to arbitration by the submission, and it must not go beyond these matters. It must be final and reasonably certain in meaning. Unless the submission expresses a contrary intention, the arbitrator may, in his award, deal with the question of the costs of the arbitration according to his discretion. An award is *prima facie* binding on the parties to the submission, and may, by leave of the court, be enforced in the same manner as a judgment or order of court to the same effect. The application for leave is usually granted, unless the award is bad on the face of it or its validity obviously doubtful. If leave to enforce an award as a judgment is not granted, the party in whose favour the award is made may bring an action on it. Where an award proceeds on an oral submission or the party against whom an award is to be enforced is outwith the jurisdiction of the court, an action on the award is the only available remedy.

An award may be set aside by the court where the award has been improperly procured—e.g. if there has been a fraudulent concealment of material evidence; or where the arbitrator or umpire has been guilty of misconduct. It is accounted misconduct on the part of an arbitrator or umpire if he decides matters which were not included in the submission, or fails to decide all the matters referred to him in the submission; or if he hears one party and refuses to hear the other, or examines witnesses in the absence of one or both parties; or if there has been any grave irregularity in the proceedings. Instead of setting the award aside, the court has a discretionary power to remit it to the arbitrator for reconsideration and amendment.

References under order of court differ in their nature and effect from an arbitration proceeding on a submission by the parties. Under the Arbitration Act, 1889, such references are of two kinds, namely, (1) references for inquiry or report, and (2) references for trial. A reference for inquiry or report may be ordered by the court on any question arising in an action, subject to the rights of the parties to a trial by jury; but in practice such an order is only made where the investigation of the question in court in the usual way would occupy too much time. The duty of the referee is not to determine the question, but to investigate the facts or figures and report to the court. The court has also power in any action—with or, in special circumstances, without the consent of the parties—to make an order referring for trial either the whole matter, or a particular question arising in the action. The decision of the referee in a reference for trial is equivalent to the verdict of a jury.

In Scotland an arbitration takes place in virtue of a written submission executed by the parties. The persons appointed to decide are called arbiters, instead of arbitrators as in England; a third person, chosen to decide in the event of the arbiters differing in opinion, is termed an oversman; and the award in a formal submission is called a decree-arbitral. An arbitration may proceed on a formal or regular deed of submission or on an informal writing. A formal deed of submission defines the matter or

matters referred to the decision of the arbiter, names the arbiter, sets forth his powers, specifies the time within which the decree-arbitral is to be pronounced, and binds the parties, under a stipulated penalty, to implement the decree-arbitral. It is also usual to provide that the submission, in the event of either party's death, shall continue in force against his heirs and representatives, and to insert a clause expressing the consent of the parties to registration, for preservation and execution, of the deed itself and of the decree-arbitral. The clause of registration is important, as it enables either party to enforce the decree-arbitral against the other party by the modes of execution appropriate to a judgment to the same effect. The Arbitration (Scotland) Act, 1893 (57 & 58 Vict. chap. 13), altering the common law, provides that an agreement to refer to arbitration shall not be invalid by reason of the reference being to a person not named, and that, unless the agreement to refer provides otherwise, arbiters shall have power to name an oversman. The statute also empowers the court to appoint an arbiter where the parties fail to concur in the nomination of an arbiter, and to appoint an oversman where the arbiters fail to agree in the nomination of an oversman. A formal arbitration proceeds generally in accordance with the procedure in Scots courts. Written pleadings, by way of a claim and answers, are ordered and lodged, and a record is made up upon these pleadings. It is a common practice for the arbiter, before issuing his decree-arbitral, to intimate to the parties his proposed findings, and to allow them, if so advised, to lodge representations. The parties in an action pending in a Scots court may, by joint minute, submit the matters in dispute between them to the adjudication of an arbiter. Such a submission is known as a judicial reference. The authority of the court is interposed to the joint minute, and, though the decision on the merits of the case is taken away from the court, the court's jurisdiction remains for the purpose of securing that the judicial referee exercises his powers and that his award is made effectual.

In the United States the common law with regard to arbitration is similar to that of England, and the legislation on the subject has proceeded on the same lines as in England. The provisions of the English Arbitration Act of 1889 have been adopted, without material alteration, in India and in many of the British colonies.

For English law, see *Russell on Arbitration* (9th ed. 1906). For international arbitration, see PEACE AND INTERNATIONAL ARBITRATION. For industrial arbitration, see ARBITRATION AND CONCILIATION.

Arbitration and Conciliation in Labour Disputes.

Since the grouping together of large bodies of work-people, which is a feature of modern days, the prospect of strikes and lock-outs as a means of enforcing demands has been an ever-present difficulty, and has led all civilised communities to attempt by legislation to set up machinery for dealing with industrial disputes by arbitration and conciliation. *Arbitration* may be defined as the settlement of an issue on which the parties have failed to agree by the decision of an impartial person to whom the parties have agreed to refer it. The term *conciliation* is a somewhat indefinite one, including on the one hand cases of intervention by a third party (sometimes called *mediation*), and on the other hand shading into direct negotiations between representatives of the parties. The object of arbitration and conciliation is to provide a means whereby the parties, fairly and without loss of dignity, can settle their differences, preferably before a strike or lock-out occurs.

The history of the earlier legislation in the United Kingdom as to arbitration in trade disputes is described in a memorandum in the Report of the Royal Commission on Labour (1890-94). Conciliation and arbitration formed one of the main subjects of inquiry by this commission, and their report contains information on the subject with regard to this country, the dominions and colonies, and foreign countries.

Following recommendations by this commission, the Conciliation Act, 1896, which at present governs official action in trade disputes in this country, was passed. The act empowers the Board of Trade, where a difference exists or is apprehended between employers and workmen, (a) to make inquiry into the causes and circumstances of the difference, and to take steps to enable the parties to meet together under a chairman; (b) on the application of one of the parties, to appoint a conciliator or board of conciliation; (c) on the application of both parties, to appoint an arbitrator. The act also provides for the registration of conciliation boards, and authorises the Board of Trade to take steps to establish conciliation boards when this course seems expedient.

In 1908 the Board of Trade devised a scheme whereby, on the application of the parties, a court of arbitration of three (or five) persons selected from panels of chairmen, employers' representatives, and labour representatives might be appointed in place of a single arbitrator. This scheme did not curtail or replace any of the existing functions or practices under the Conciliation Act; its object was to remove the fear which workmen have sometimes expressed that individual conciliators and arbitrators, however fair they mean to be, do not intimately understand the position of the manual labourer. The scheme has in some cases proved acceptable to the parties when the appointment of a single arbitrator would have created difficulties. In the majority of cases the courts have consisted of three persons, and almost without exception the awards have been unanimous.

A further development occurred in 1911 when the government established an Industrial Council consisting of thirteen representatives of employers and a corresponding number of representatives of work-people, 'for the purpose of considering and of inquiring into matters referred to them affecting trade disputes; and especially of taking suitable action in regard to any dispute referred to them affecting the principal trades of the country, or likely to cause disagreements involving the ancillary trades, or which the parties before or after the breaking out of a dispute are themselves unable to settle.' Sir George Askwith was appointed chairman of the council, and the Chief Industrial Commissioner's Department, through which the Board of Trade powers of conciliation and arbitration were now exercised, was at the same time established under his direction. Subsequently at the request of his Majesty's government the council made an inquiry respecting (1) the best method of securing the due fulfilment of industrial agreements, and (2) how far, and in what manner, industrial agreements which are made between representative bodies of employers and of workmen should be enforced throughout a particular trade or district. Their report was presented to parliament in July 1913.

With regard to the proceedings under the Conciliation Act, 1896, the number of cases dealt with showed a marked increase from and after 1910, and action was taken in most of the largest disputes. In the years immediately following the passing of the act application for the services of the department came mainly from one side only (generally from the work-people); but in the later years the majority of applications were made

jointly by the parties, or by organisations representing them.

A marked feature of the industrial organisation of this country is the existence of a large number of *permanent voluntary conciliation and arbitration boards and joint committees*, which have attained marked success and in many cases have done extremely useful work. Among the earlier boards still in existence are the Board of Conciliation and Arbitration for the Manufactured Iron and Steel Trade of the North of England (formed in 1869), the Joint Committee of the Durham Coal-owners' and Miners' Associations, the Joint Committee of the Cleveland Ironmasters and Blast-furnacemen, and the Midland Iron and Steel Wages Board (formed in 1872). In addition, there are a number of arrangements (such as the late Brooklands Agreement in the cotton-spinning industry) which provide permanent machinery for dealing with differences by conciliatory means. The existence of these boards and agreements is only made possible by organisation on the two sides.

The functions of conciliation boards vary very considerably. The most frequent type is that which deals with any question submitted, whether of a general or individual character. Some boards, however, deal only with special questions, such as fixing the general level of wages or deciding questions of demarcation of work. The boards generally consist of equal numbers of representatives of employers and work-people, and it happens not infrequently that the two sides of the board are equally divided on questions brought before them. An important feature of the rules of procedure, therefore, is the provision made in many cases to avoid this deadlock, the difficulty being referred to an independent chairman or an arbitrator. The rules of a number of the boards provide, or it is understood between the parties, that there shall be no stoppage of working pending and during consideration of the matter.

Agreements and awards made in connection with conciliation boards, like those under the Conciliation Act, are not legally enforceable. In the rules of some of the boards, notably those in the boot and shoe trade, provision has been made for the establishment of a guarantee fund, and under certain circumstances money penalties are inflicted.

It will be seen that the system of industrial arbitration and conciliation in the United Kingdom is entirely voluntary. Under existing legislation there is nothing illegal in a strike or lock-out, and no compulsory powers exist for bringing about a settlement; there is no power to enforce the attendance at conciliation or arbitration proceedings of either party to a dispute, and no power to enforce an award. In this connection, however, it may be noted that the community has certain reserve powers, and the national strike of coal-miners in the spring of 1912 was terminated by parliament passing the Coal-mines (Minimum Wage) Act.

In recent years the right of the public to be informed with regard to labour disputes has been increasingly recognised, and will undoubtedly become in the future a prominent factor in such disputes. The influence of public opinion in securing the settlement of disputes has been utilised in this country under the Conciliation Act (e.g. the Dublin transport-workers' strike, 1913), and in other countries, but the principle is perhaps most clearly emphasised in the Industrial Disputes Investigation Act of Canada (described below).

During the war compulsory arbitration was enacted by the series of Munitions of War acts with three forms of tribunals, of which the Committee on Production was the chief; but compulsory arbitration ended soon after the armistice, and when Sir George Askwith retired in 1919 a Wages

and Arbitration Department of the Ministry of Labour was established in place of a Chief Industrial Commissioner, and the Industrial Courts Act provided that certain neutral chairmen and representatives of employers and employed should be available as arbitrators for the hearing of cases voluntarily submitted to them.

Strikes and lock-outs may roughly be divided into those arising from questions of material interest (such as alterations in wages or hours of labour) and those arising from questions of principle (such as the non-unionist question). In practice, conciliation or arbitration is much more feasible in the first class of cases, since such matters admit of compromise. If the parties are unable to agree by friendly discussion, they may agree to refer the matter to arbitration, or an already existing agreement may provide for reference to arbitration. The main advantage of conciliation over arbitration lies in the fact that conciliation leads to agreements the conditions of which are known to the parties before attaching their signatures, whereas under arbitration the parties bind themselves to accept conditions of which they are unaware. Further, arbitration awards rarely satisfy both sides, and there are sometimes complaints that arbitrators are unconsciously biased. Generally speaking, the largest disputes are settled by conciliation rather than arbitration. In conciliation more especially much depends on the personality of the conciliator. Experience in this country has shown the desirability that conciliation and arbitration machinery should be simple and elastic, capable of being applied in various ways according to the needs of each case.

Opinion in this country in recent years has always been opposed to *compulsory arbitration*. The Report of the Industrial Council referred to above says: 'We do not view with favour the establishment of "compulsory" arbitration.' The question has on a number of occasions been debated at the Trades Union Congress, and defeated. Forms of compulsory arbitration have been adopted in certain Australasian states, and are described below. The chief difficulty attaching to compulsory arbitration lies in the impracticability, either by fines or imprisonment, of punishing large bodies of work-people for breach.

The British dominions and some of the principal foreign countries provide many interesting legislative experiments in industrial conciliation and arbitration, but in a short article it is not possible to emphasise all the features of their legislation. Attention may be drawn to the insistence of the rights of the public (Canada), compulsory arbitration (Australasia), power to summon parties to give evidence (Canada, &c.), enforcement of awards (Australasia, &c.), due notice of intended alterations in working conditions or of intention to strike or lock-out (Canada, New Zealand), and special disabilities respecting 'state' employees or employees in 'public utility' services (Canada, &c.). An inquiry by the Board of Trade in 1912 showed at least nine European countries with legislation designed to avert strikes of employees in public utility services. The voluntary arbitration and conciliation boards which play so large a part in the settlement of industrial disputes in the United Kingdom are rarely found in other countries.

In *France*, as in the United Kingdom, complete freedom to strike exists, with slight exceptions. Bodies known as *Conseils de Prud'hommes*, organised in groups of trades, and composed of employers and work-people in equal numbers, have existed since 1806 for the settlement of disputes affecting *individual* work-people. The law dealing with the settlement of *collective* disputes is the Voluntary Conciliation and Arbitration Act of 1892. Under

this law either party to a dispute, or both parties jointly, may apply to the local justice of the peace for the appointment of a conciliation committee. If the application comes from one party, the justice must proceed to inquire whether or not the other party assents to the dispute being dealt with by conciliation or arbitration. In the case of a strike or lock-out the justice may himself take the initiative in the matter. These conciliation committees consist of representatives nominated in equal numbers by employers and work-people, and the justice presides. Should the conciliation committee fail to bring about an agreement, the justice invites the parties to accept arbitration. Particulars of cases dealt with and proceedings must be made public, and some attempt is thus made to bring the pressure of public opinion to bear on the parties. The disputing parties, however, are subject to no compulsion at any stage of the proceedings, and no method is provided for enforcing awards. It would appear that when the law is put into operation it is almost invariably on the requisition of the work-people, or on the initiative of the justice of the peace himself. In a considerable percentage of cases the offer of mediation is refused, for the most part by the employers. Where conciliation committees are formed by consent of both sides, a successful issue appears to be reached in a large proportion of cases.

In *Germany* two types of official conciliation tribunals have existed—the courts of arbitration for the guilds of handicrafts, and the industrial courts for the rest of the working-classes. Like the French *Conseils de Prud'hommes*, these industrial courts were formed primarily to adjust individual disputes and claims, but they also dealt with collective disputes. The imperial law of 1890 as amended by the law of 1901 required the establishment of industrial courts in all towns of over 20,000 inhabitants, and elsewhere they might be formed at the discretion of the government. Action had to be taken by the court in the case of a strike or lock-out on the joint request of the parties, and a court might also intervene on its own initiative or on the application of one party. If application was made by one party only, it was the duty of the president of the court (who was appointed by the local authorities, and must not be either an employer or employee) to make every effort to induce the other party to agree to refer the matter to the court. In each case the court consisted of the president and at least two representatives each of employers and work-people not themselves concerned in the dispute. In order to determine the facts of the dispute the president could require any person concerned in the dispute to attend the hearing and give evidence. In the event of failure to secure an agreement, the court embodied in the form of a decision its conclusions as to the terms upon which it considered the parties should agree, and called upon the disputants to declare their acceptance or rejection within a certain time. If either party did not accept the decision, the fact was made public. The industrial courts did not possess powers to enforce their decisions.

Although the machinery described above was voluntary, it should be borne in mind that strict control has been exercised in Germany over combinations of employees in the railway services, &c., and that undertakings carried on by the state or local authority have been held by the courts not to fall within the sections of the imperial code specifically granting freedom to strike.

In the *United States* industrial conciliation and arbitration is regulated by state law, except in the case of railroads, which are dealt with by the federal law. The basic federal law was the Act of June 1898 (slightly amended by an Act of

March 1911), commonly known as the Erdman Act, which applied only to persons engaged in actual train operation, and was less drastic than the earlier Federal Arbitration Act of 1888 which it superseded, except in its provision for the enforcement of awards by the United States courts where a voluntary arbitration had been agreed upon. The Erdman Act provided that in cases of disputes seriously interrupting or threatening to interrupt inter-state traffic, either party to the dispute might appeal to the chairman of the Inter-state Commerce Commission and the Commissioner of Labour to endeavour to mediate with a view to bringing about a settlement. No authority was reserved to the government to intervene on their own initiative, their intervention being conditioned by the receipt of a request for mediation from one of the parties and by the acceptance by the other party of the offer of mediation. Should such mediation prove unsuccessful, the mediators were to endeavour to induce the disputants to accept arbitration, the arbitrating body consisting of three persons—one each named by the parties, and the third chosen by these two or, failing that, by the mediators. During the eight and a half years following the enactment of the law only one attempt (in 1899) was made to utilise its provisions, and that attempt proved entirely fruitless. Subsequently, however, the act was invoked in a considerable number of cases and with increasing frequency. To meet criticisms made against the act, another act was passed in July 1913 which established a board of mediation and conciliation, with power to intervene on its own initiative, and permitted a board of arbitration to consist of six persons, instead of three as under the Erdman Act. Although complete freedom to strike exists in the United States, injunctions are frequently issued by the courts restraining railway servants from striking on the ground that such action would contravene certain federal statutes.

The machinery of conciliation and arbitration established in the different states varies, but the most common form is that of central state boards or commissions. A board consists, as a rule, of three members, appointed by the governor of the state, one being representative of the employers and another of the work-people, and the term of election varies from one to four years. A board may intervene on its own initiative, and must intervene at the request of either or both parties to a dispute. As a rule, the findings of a board are binding only when it acts on a joint requisition.

Canada.—Among the dominion experiments one of the most interesting is the Industrial Disputes Investigation Act, 1907, of Canada, popularly known as the 'Lemieux' Act, which was amended in some of its details in 1910. Prior to the Act of 1907 there had been, in addition to acts existing in some of the provinces, dominion legislation in 1900, 1903, and 1906. The immediate cause of the 'Lemieux' Act was a protracted strike of miners at Lethbridge, Alberta, which seriously threatened the supply of coal in Western Canada. The purpose of the act is to ensure the recognition of the interests of the public, as a third party, in trade disputes, and the insistence that that third party, through the government, shall have a voice in regard to a dispute affecting their interests, and, according to the act, before a stoppage of work takes place.

The act provides that in the event of any dispute arising in certain classes of industries (mining, transportation or communication, or public service utility) the matter must be submitted to a board of conciliation and investigation consisting of three persons, which board has the power of summoning and enforcing the attendance of witnesses, &c., the right of inspecting books, documents, &c., although the information obtained therefrom is not, except

in so far as the board deems it expedient, made public. In the course of the investigation the board may take such steps as it deems advisable to bring about a settlement. If no settlement is arrived at, the board is required to make a full report to the Minister of Labour, with such recommendations as it sees fit for the settlement of the dispute, and this report is duly published. Pending the investigation no strike or lock-out can take place—and infringement is punishable by fines—but after the publication of the finding of the board the parties are free to take such action as they choose. In the industries covered by the act at least thirty days' notice of an intended change affecting wages or hours of labour must be given. If both parties to a dispute agree, the provisions of the act may be applied in the case of any other industry or trade.

The act has been copied in Queensland and the Transvaal. It formed the subject of a special inquiry by Sir George Askwith, on behalf of his Majesty's government, in 1912, and his report on the working of the act and its applicability to this country was presented to parliament in December of that year.

The *Australasian* legislation is important because of its experiments in compulsory arbitration. The acts which have been passed are numerous, but the Industrial Conciliation and Arbitration Act, 1894, of *New Zealand* is probably the best known by reason of its being the first attempt to establish compulsory arbitration in trade disputes, and it formed the basis of other Australasian legislation. It provided for the voluntary registration of associations of employers or work-people as 'industrial unions,' and the establishment of district boards of conciliation, with an independent chairman, to which a dispute might be referred, in practice only by a registered association. Strikes and lock-outs were prohibited only with respect to bodies on behalf of which cases were pending, or when they were subject to award. Failing settlement by the conciliation board the matter proceeded to an arbitration court. Under the original act disputes ordinarily went first to a conciliation board, except by agreement between the parties, but it was subsequently provided that either party might carry a dispute direct to the arbitration court, which in effect became the sole operative tribunal under the act. Under a further Act of 1908 (slightly amended in 1911) the reference of disputes became obligatory in the first instance to councils of conciliation, appointed *ad hoc*, and the court dealt with matters only if the councils failed to secure a settlement. In certain industries of the nature of public utilities fines were to be inflicted in the case of a strike or lock-out unless fourteen days' written notice had been given within one month previous to such strike or lock-out. This legislature formed the basis of the New South Wales Act of 1901 (which established a court of industrial arbitration, omitting the conciliation procedure of the New Zealand Act), the Western Australian Act of 1902, and the Commonwealth Act of 1904, which applied to disputes extending beyond the limits of any one state. In Victoria matters took a different direction, a system of wages boards being established to determine minimum rates of wages and other working conditions, the object being rather to put down sweating than to prevent industrial strife. An Act of 1908 introduced the system of wages boards into New South Wales, but also made it incumbent on the chairman to endeavour in the first instance to effect a settlement by conciliation, and provided for appeal to the industrial court. The prohibition of strikes and lock-outs of the earlier New South Wales Act was retained.

South Australia, Tasmania, and Queensland have

adopted the wages boards system, the two former, but not the latter, prohibiting strikes and lock-outs in respect to those trades for which wages boards have been formed and in connection with the determinations thereof. In the Industrial Peace Act of 1912 Queensland has adopted the provisions of the Canadian Act described above. The frequent recourse to amending legislation on this subject in Australasia appears to indicate the difficulty even in a new country of enforcing such restrictive measures, and official statistics seem to show that in spite of prohibitions a number of strikes do in fact occur. Recent legislation during and after the war has endeavoured to meet the difficulties of disputes confined to particular states and disputes affecting the interests of the whole Commonwealth.

BIBLIOGRAPHY.—Among the official books of reference on the subject may be mentioned the *Reports of the Royal Commission on Labour* (1891-94); *Annual Reports of the Board of Trade on Strikes and Lock-outs*; *Reports on Rules of Conciliation Boards and Joint Committees*; *Reports of Proceedings under the Conciliation Act, 1896*; *Report to the Board of Trade on the Industrial Disputes Investigation Act of Canada, 1907*, by Sir George Askwith, K.C.B., K.C.; *Report of the Industrial Council on Inquiry into Industrial Agreements and Minutes of Evidence taken before the Industrial Council in connection therewith* (1913); *Memoranda on certain Laws in the British Dominions and Foreign Countries affecting Strikes and Lock-outs, with special reference to Public Utility Services* (1912); *Report to Home Office on the Wages Boards and Industrial Conciliation and Arbitration Acts of Australia and New Zealand* (1908); *Abstracts of Foreign Labour Statistics*; *Bulletins of the United States Bureau of Labour*, especially for September 1905, May 1908, January 1910, and January 1912; *Report of the Royal Commission of Inquiry on Industrial Arbitration in the State of New South Wales* (1913).

Among the unofficial books may be mentioned: Crompton, *Industrial Conciliation* (1876); L. L. Price, *Industrial Peace* (1887) and *The Recent History of Industrial Peace* (1905); N. P. Gilman, *Methods of Industrial Peace* (1904); A. C. Pigou, *Principles and Methods of Industrial Peace* (1905); Douglas Knoop, *Industrial Peace* (1908); the *Edinburgh Review*, (January 1914); Judge Higgins, in *The Harvard Law Review* (November 1915 and January 1919); and Lord Askwith, *Industrial Problems and Disputes* (1920).

Arbor Day, in the United States, Canada, and elsewhere, a day set apart (differing in different states) for the planting of trees and shrubs by school children.

Arboriculture. See **FORESTRY**.

Arbor Vitæ (*Thuja*), an evergreen genus of coniferous trees and shrubs allied to the cypress. The common Arbor Vitæ (*T. occidentalis*) is a native of North America, especially between lat 45° and 49°, but has long been well known in Europe. It is a tree of 20 to 50 feet high; the young leafy twigs have a balsamic smell, and both they and the wood were formerly in great repute as a medicine; the oil obtained by distillation from the twigs, which has a pungent and camphor-like taste, has been employed as a vermifuge. The wood of the stem is reddish, soft, and very light, but compact, tough, and durable, bearing exposure to the weather remarkably well. The tree is often planted in Britain as an ornamental tree, but does not attain so great a size as in its native country. It delights in cool, moist situations.—The Chinese Arbor Vitæ (*T. orientalis*), a native of China and Japan, which is immediately distinguishable from the former species by its upright branches and larger, almost globose and rough cones, is also a common ornament of pleasure-grounds in Britain and on the Continent; but it does not grow so tall as the preceding, and is more sensible of the cold of severe winters. The balsamic smell is very agreeable. The tree yields a resin having a pleasant odour, to which high medicinal virtues

were formerly ascribed; hence the remarkable name, *Arbor Vitæ* ('tree of life'), given to this species, and extended to the genus. In its native country this species also attains the size of a considerable tree.—When the human cerebellum is cut vertically, a tree-like appearance seen is called *arbor vitæ*.

Arbroath', ABERBROTH'WICK, or ABERBROTH'OCK, a seaport and manufacturing town of Forfarshire, at the mouth of the Brothock Burn, 17 miles ENE. of Dundee. Here in 1178 William the Lion founded a Tyronensian abbey in honour of Becket; and here in 1214 he was buried. Cardinal Beaton was the last of its thirty-two mitred abbots. Next to Holyrood, the abbey was the most richly endowed monastery in Scotland. It was destroyed by the Reformers in 1560. The ruins of its cruciform church, which measured 276 by 160 feet, and was mainly Early English in style, are very picturesque, presenting a noble west doorway and a rose-window, 'the round O of Arbroath.' Dr Johnson greatly admired them in 1773. The chief industries of Arbroath are flax-spinning, engineering, the manufacture of boots, sail-cloth, and linen fabrics. The new harbour, begun in 1841, admits vessels of 400 tons; the old harbour was converted into a wet-dock (1871-77). Arbroath is a royal burgh, and with Montrose, Brechin, Forfar, and Bervie, returns one member to parliament. It is the 'Fairport' of *The Antiquary*; Auchmithie, 3½ miles to the NE., is 'Musselcrag'; and the Redhead Craggs and Coves are scenes in the novel. The Bell-rock (q.v.) is 12 miles SE. Pop. 20,000.

Arbroath Flags are thin-bedded gray sandstones and flagstones which occur in the Lower Old Red Sandstone of Forfarshire.

Arbuthnot, or ARBUTHNOTT, JOHN, physician and wit, the friend of Swift and Pope, was born at Arbuthnot, in Kincardineshire, 29th April 1667. His father was the (Episcopal) parish minister, who was dispossessed by the Presbyterians after the Revolution. One of John's brothers fought under Dundee at Killiecrankie, and another in Mar's rebellion; John was, according to Chesterfield, 'a Jacobite by prejudice, a republican by reflection and reasoning.' He studied at Aberdeen and University College, Oxford, but took his M.D. degree at St Andrews (1696). He removed soon after to London, and there supported himself by teaching mathematics. In 1697 he published an *Examination of Dr Woodward's Account of the Deluge*, which brought him into notice as a man of no common ability. Accident called him into attendance on Prince George of Denmark; in 1705 he was appointed physician-extraordinary to the queen, and her death in 1714 was a severe blow to his prosperity. In 1715, along with Pope, he assisted Gay in *Three Hours after Marriage*, a farce that, in spite of the trio of wits, proved a complete failure. He pronounced the Harveian oration in 1727, and died 27th February 1735. Arbuthnot was one of the leaders in that circle of wits which adorned the reign of Queen Anne, and was still more nobly distinguished by the rectitude of his morals and the goodness of his heart. He was one of the kindest and truest of friends.—'If there were a dozen Arbuthnots in the world,' wrote Swift to Pope in 1725, 'I would burn my Travels.' Utterly careless of literary fame, he was the chief, if not sole author of that brilliant satire, the *Memoirs of Martinus Scriblerus*, first published in Pope's works (1741); and his too was the celebrated political *jeu d'esprit*, the *History of John Bull* (1712), which has so often been imitated. Among his scientific works, the essays *On Aliments* (1731) and *Concerning the Effects of Air on Human Bodies* (1732) possess

much merit. The latter particularly displays a deep knowledge of physiological laws. See the *Life and Works*, by G. A. Aitken (1892).

Arbutus, a genus of small trees and shrubs of the order Ericaceæ. *Arbutus Unedo*, the Strawberry Tree, is common on all the Mediterranean shores and (with gaps) extends along the Atlantic

Arbutus Unedo :
a, fruit; b, section of fruit.

to one locality in the British Isles, the Lakes of Killarney, where its fine foliage adds much to the charm of the scenery. In Britain, it is often planted as an ornamental evergreen. It grows to the height of 20 to 30 feet, but is rather a great bush than a tree. The bark is rugged; the leaves oblong-lanceolate, smooth, shining, serrate; the flowers nodding; corolla urn-shaped, greenish-white; the fruit scarlet, somewhat resembling a strawberry, with a vapid sweetish taste. A wine is made from it in Southern Europe, which, however, is narcotic, as the fruit itself is when eaten freely. The bark and leaves are astringent. *Arbutus Andrachne* is also sometimes cultivated as an ornamental plant in Britain, but is impatient of severe frosts. Its fruit, and that of *Arbutus integrifolia*, are eaten in Greece and the East. But all the species seem to possess narcotic qualities, the fruit of *Arbutus furens*, a small shrub, a native of Chile, so much so as to cause delirium.—*Arbutus aculeata* (Cape Horn) is an elegant evergreen, resembling the myrtle; and the *Arbutus Menziesii*, or madroña tree of Western North America, is a very interesting and beautiful species.

Arc. See JOAN OF ARC.

Arc (Lat. *arcus*, 'a bow') is any part of a curved line. The straight line joining the ends of an arc is its *chord*, which is always less than the arc itself. Arcs of circles are *similar* when they subtend equal angles at the centres of their respective circles; and if similar arcs belong to equal circles, the arcs themselves are *equal*. The length of an arc is readily found if the angle which it subtends at the centre of the circle is known, and also the length of the whole circumference. Let the whole circumference be 100, and the angle of an arc 50°, the length of the arc is

$$360^\circ : 50^\circ :: 100 : \frac{100 \times 50}{360} = 14 \text{ nearly.}$$

Arca, or **ARK-SHELL**, a genus of lamellibranchiate molluscs. See BIVALVES.

Arcachon, a watering-place (dating from 1854) in Gironde, France, on the S. side of the Bassin d'Arcachon, 34 miles S.W. of Bordeaux by rail.

The fine broad sands are admirably adapted for bathing; and the place is sheltered by sand-hills, covered with extensive pine-woods, in which game abounds. Its main street stretches $2\frac{1}{2}$ miles along the shore, with the pine-forest immediately behind. The climate is always temperate, and the rainfall is but 32 inches. Its numerous villas amongst the firs are much frequented in winter by invalids afflicted with lung disease. Scientific oyster-culture is practised here on a large scale (see OYSTER). A fleet of motor-boats engages in saidine-fishing. Pop. 11,000.

Arcade (Fr.), a row of arches supported by columns, either having an open space of greater or less width behind them, or in contact with masonry. The arcade in Gothic corresponds to the colonnade in classical architecture. The term arcade is sometimes applied to the row of piers, or columns and arches, by which the aisles are divided from the nave of a church, or by which cloisters, or what are erroneously called piazzas in Britain, are enclosed; but it is more generally confined to those series of smaller arches which are employed simply for ornamentation. These are often found surrounding the square towers of English churches. The term is also applied, but improperly, to a glass-covered street or lane, with a row of shops or stalls on each side.

Arcadelt, JACOB, a Netherlander who composed masses, madrigals, motets, &c., and enjoyed popularity about the middle of the 16th century. Italy was long his home.

Arcadia, the central and highest part of the Peloponnesus, was in length about 50 miles, in breadth about 40. According to Pausanias, it derived its name from the eponymous hero Arcas, the son of Callisto. Next to Laconia, Arcadia was the largest country in the Peloponnesus. It was girt round by a ring of mountains, which cut off to a large extent its communication with the rest of the peninsula. Mountains also intersected it in different directions. The western part of what was anciently Arcadia is wild, bleak, and rugged; the eastern is more fertile. The loftiest peak in Arcadia—the loftiest also in the Peloponnesus—is Mount Cyllene, in the north-east (7787 feet). The chief river is the Alpheus (q.v.). The modern province of Arcadia has an area of 2020 sq. m., and a population of 156,000. Originally Arcadia was named Pelasgia, after its first inhabitants, the Pelasgi. Subsequently, it was divided into several small states, which formed a confederation. Of these, the chief were Mantinea, Tegea, Orchomenos, Pheneus, and Psophis. The inhabitants, engaged chiefly in tending cattle and in hunting among the wild highlands, remained long in a state of barbarism. They were passionately fond of music and dancing, and were especially devoted to the worship of Pan and Artemis. Arcadia became both to ancient and modern poets the land of peace, innocence, and patriarchal manners; but the Arcadian shepherds of modern pastoral poetry harmonise but indifferently with the barbarous hill-men of ancient Arcadia.

Arcadius, first emperor of the East alone, was born in Spain, 377 A.D., and was the son of the Emperor Theodosius, after whose death in 395 A.D. the Roman empire was divided into East and West, the West falling to Honorius. Arcadius lived in oriental state and splendour, and his dominion extended from the Adriatic Sea to the river Tigris, and from Scythia to Ethiopia; but the real rulers over this vast empire were, first, the Gaul Rufinus, and afterwards the eunuch Eutropius, who openly assumed the reins of government and the command of the army, while the emperor reposed in luxurious indifference. In 399 Eutropius was for a time supplanted by another usurper, Gainas; and afterwards,

Eudoxia, the wife of the emperor, assumed the supremacy. The great archbishop, Chrysostom, was exiled by Eudoxia in 404, because of his stern denunciation of vice. During the reign of Arcadius, his territories suffered by barbarian incursions, earthquakes, and famine. He died in 408 A.D.

Arcani Disciplina. See DISCIPLINA ARCANI.

Arcanum, THE GREAT. In the middle ages, the Latin word *arcanum* ('secret') was used of any of the most valued preparations of alchemy; but the title was especially applied, as above, to the highest problems of the science, the discovery of such supposed great secrets of nature as the grand elixir. See ALCHEMY.

Arcesilaus, a Greek philosopher, founder of the New Academy, was born at Pitane in Æolia, Asia Minor, 316 B.C. He studied philosophy, first under Theophrastus the Peripatetic, and afterwards under Crantor. He ultimately became the head of the Academic school, or those who held the doctrines of Plato; but he introduced so many innovations that its philosophic character was completely changed in the direction of scepticism. His great rivals were the Stoics. He denied the Stoical doctrine of knowledge, which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the existence of any sufficient criterion of truth, such as the 'irresistible conviction' of the Stoics, and recommended abstinence from all dogmatic judgments. In practice he maintained that we must act on grounds of probability. A wit, a poet, and a man of frank and generous disposition, which seems to have captivated his disciples even more than his philosophy, he was yet accused of the grossest profligacy. He died 241 B.C.

Arcesilaus, the name of four kings of Cyrene, of the Battiad dynasty. ARCESILAUS I., son of the founder of the colony, Battus I., reigned B.C. 599-583.—ARCESILAUS II. (c. 560-550) 'the oppressive,' son of Battus II., failed to cope with a Libyan revolt and the opposition of his brothers, who withdrew and founded Barca. By one of them, or by a friend, the king was poisoned.—ARCESILAUS III. (c. 530-514), son of Battus III., sought to abolish the constitution set up in his father's time, was driven out, re-established himself by help of Samian mercenaries, submitted to Persia, and seems to have been driven out again, and assassinated.—ARCESILAUS IV. continued the same policy in vain. The monarchy ended with his death, c. 450.

Arch, a concave structure of bricks, stones, or other materials built or turned on a centring over an open space, and so arranged as to support each other by mutual pressure, and to sustain a superincumbent weight. It was used by the ancient Egyptians and Assyrians and not unknown to the Greeks, though they did not employ it generally in their architectural structures. It is to the Romans that the nations of modern Europe are indebted for the use of the arch. The Romans most probably derived their acquaintance with it from the Etruscans, who, as well as the Pelasgians (q.v.) of Greece, made their arches pointed. The introduction of the arch by the Romans gradually effected a complete revolution in the architectural forms which they had borrowed from the Greeks. The predominance of horizontal lines gave way by degrees, till, in the works of the late empire, such as the palace of Diocletian at Spalato, the entablature was entirely omitted, and the archivolt sprang from the capital of the columns. The Greek traditions of architrave, frieze, and cornice were thus at last got rid of, and in the Romanesque and Gothic styles the arches sprang freely from the caps of the shafts. A very simple structure, frequently met with in the so-called Saxon early edifices in our own country,

consists of two stones, their lower ends resting on rude piers, their tops leaning against each other, and thus forming two sides of a triangle, which is capable of supporting a moderate superincumbent weight. It is not impossible that out of this rude construction the arch, in its later and more elaborate forms, may have developed itself.

Of the arch itself, the following variations of form may be enumerated: the semicircle (1), the segment (2), the ellipse (3), which were the only forms employed by the Romans, and which alone were known in mediæval architecture up to the time at which the pointed arch was introduced. The stilted arch (4) and the horseshoe arch (5) are modifications of these, and in both the centre or point

1. Semicircle.

2. Segment.

3. Ellipse.

4. Stilted Arch.

5. Horseshoe Arch.

from which the arch is described is above the line of the impost; but in the former the mouldings are continued downwards vertically, whilst in the latter they are slightly inclined inwards, or the curve is prolonged till it meets the impost. The horseshoe arch belongs peculiarly to Arabian Architecture (q.v.), not only from its having been adopted along with the faith of the Prophet, but from its continuing to be used exclusively by his followers. The pointed arch, as we have seen, was employed by the Pelasgians, and examples are also found in Egypt and Persia of very early date. It was probably introduced into Western Europe by the Mohammedans, and was universally employed in the vaults of the churches of Provence from the 10th to the 12th century. This arose from its being simpler of construction than the round vault. In the 12th century this form was adopted in Northern France, and was soon developed into the Gothic style. See GOTHIC ARCHITECTURE. The greater or less acuteness of the pointed arch depends on the position of the two centre points from which its curved sides are described. Its various proportions will be better understood from the accompanying diagrams (6, 7, 8, 9) than from words.

6. Equilateral Arch.

7. Lancet Arch.

8. Drop Arch.

9. Segmental Arch.

Of the foil arches (10, 11, 12, 13, 14), or arches in which the forms of a leaf are imitated, the first three are examples of the trefoil, the fourth of the

cinquefoil, and the fifth of the polyfoil, the last being met with in Arabian and Romanesque buildings. At a later period of Gothic architecture,

10, 11, 12. Trefoil Arches

with the decorated style, the ogee arch (15) was introduced, and the Tudor or four-centred arch

13. Cinquefoil Arch.

14. Polyfoil Arch.

(16) appeared about the commencement of the Perpendicular style. When first introduced, the

15. Ogee Arch.

16. Tudor Arch.

proportions of this arch were bold and effective; but it was gradually depressed till the principle of the arch was lost, and its very form was again merged first in three, and then in one flat stone or lintel over an opening. With the last form of the Tudor arch we thus reach almost the point of departure in the construction of the arch, and complete our enumeration of its forms.

The sides of an arch are termed *haunches* or *flanks*, and its highest part is called the *crown*.

The wedge-shaped stones, bricks, or other materials of which an arch is constructed, are called *voussoirs* (*a, a, a*); the uppermost one of all (*b*) is called the *keystone*; the lowest, which is placed immediately over the impost, the *springer*, (*c*), or springing-stone; the under or lower side of the voussoirs, the *intrados*; the upper side, the *extrados* or *back*. For the mechanical principle of the arch, and of the conditions of stability, reference must be made to works on mechanical engineering. See also BRIDGE, BUTTRESS.

Arch, TRIUMPHAL, a structure erected by the Romans across roads, or at the entrance of cities, in honour of victorious generals. The earliest triumphal arches were two erected by L. Stertinius (196 B.C.) in the Circus Maximus and the Forum Boarium. Under the emperors, these structures became numerous and magnificent, and were decorated with bas-reliefs and inscriptions. Of nearly forty built in Rome during that period, at least three remain, those of Titus (*circa* 82 A.D.), Septimius Severus (203 A.D.), and of Constantine (306-337 A.D.). Numerous similar monuments

exist also in other parts of the old Roman empire, as at Rimini, Susa, Verona, Ancona Orange (in France), Capura (in Spain). Napoleon proposed to adorn Paris with four triumphal arches, and erected in 1806 the Arc de Triomphe du Carrousel, between the Louvre and the Tuileries, after the model of the arch of Septimius Severus. The Arc de Triomphe de l'Etoile, beyond the Champs Elysees, was begun at the same time, but not completed till 1836. Through it the Germans marched on their entry into Paris in 1871. In London there is the Marble Arch, transferred to Hyde Park in 1851 from Buckingham Palace, where

Arch of Titus.

George IV. erected it at a cost of £80,000. It resembles the Arch of Constantine.

Arch, JOSEPH, was born on 10th November 1826 at Balford, Warwickshire, and, whilst still a farm-labourer, became a Primitive Methodist preacher. In 1872 he founded the National Agricultural Labourers' Union, and thereby, according to Mr Justin M'Carthy, 'began the emancipation of the rural labourers.' He afterwards visited Canada to inquire into the labour and emigration questions; and in 1885-86 he represented in parliament the north-west division of Norfolk, which again returned him in 1892 and 1895. He died 12th February 1919. See his autobiography (1898).

Archadelt. See ARCADELT.

Archæan System forms, in Geology (q.v.), the basement division of the stratified series of rocks. The rocks included under Archæan system consist principally of crystalline schistose rocks, and attain a thickness of many thousand feet. There is invariably an *unconformity* between them and the strata which happen to rest upon them. It is quite possible that some of the regions of crystalline schists which are described as belonging to the Archæan system may really pertain to a later date—because all that can be asserted of such crystalline schists is that they are older than the strata which immediately overlie them. Sometimes these overlying strata are of older, sometimes of younger Palæozoic, or even of Mesozoic and Cainozoic age. Two groups are recognised in the Archæan system—the *lower* or 'old gneiss formation,' consisting principally of coarsely crystalline gneiss, along with hornblende-schist, quartzite, and crystalline limestone. The *upper* group, or 'crystalline schist formation,' comprises chiefly mica-schists, chlorite-schists, talc-schists, phyllites,

and occasional conglomerates. The Archæan system is well developed in many different parts of the globe. It covers considerable areas in the Outer Hebrides and the western parts of Ross and Sutherland, and much more extensive regions in Scandinavia, Finland, and the N.W. of Russia. Archæan rocks also form the core or central portion of many mountain-ranges, as the Urals, the Carpathians, the Alps, the Pyrenees, &c. They appear also in many of the hilly tracts of Middle Europe, as in Saxony, Bohemia, and Bavaria. In North America they extend from the region of the great lakes north to the arctic circle, and they also form the nuclei of many mountain-ranges in the same country. They have been recognised in the coast-ranges of Brazil, in Venezuela, and the Andes; and they likewise occur in India and New Zealand. In one of the crystalline limestones of the Archæan system in Canada occur the remains of what was formerly considered to have been a massive reef-building Foraminifer (*Eozoon*, q.v.), but is now believed to be entirely a mineral structure.

The archæan rocks are often penetrated by mineral veins from which large supplies of various metals have been obtained. Great masses of iron-ore form a marked feature of the archæan system in Canada.

Archæology (Gr. *archaios*, 'ancient,' and *logos*, 'a discourse') is the science which deduces a knowledge of past times from the study of their existing remains. The materials of the science are the relics of the human life of all former ages. Its methods, like those of the natural sciences, are both deductive and inductive. It regards the products of human handicraft which it investigates as manifestations of the ability and purpose of the men who made them. When these products are compared among themselves, the investigation proceeds to the determination of types, and their arrangement in a classified system. Comparison of the classified groups discloses gradations of adaptation and development of character which determine the sequence of the types. These sequences are tested by the associations of characteristic examples in the deposits in which they are found; and the general result is the recovery of such a logical story of the progress of culture and civilisation as the surviving relics of bygone ages are capable of disclosing. But the story thus recovered is not history. It proceeds by simple sequences, and not by a chronological specification of dates and measurement of durations. History deals with events and incidents as manifestations of human motive and action; archæology deals with types and systems as expressions of human culture and civilisation. The archæology of a historic period may be capable of illustrating and supplementing the records of contemporary historians by disclosing a multiplicity of unchronicled details relating to the common life of the people, of which we should have been otherwise left in ignorance. The historic or non-historic character of the time to be investigated has, however, no bearing on the methods of its archæological investigation. These are the same for all times and for all areas. But, as in other sciences whose materials are universally distributed, there is necessarily a limitation of its deductions to the special area investigated. The results of observation show that widely separated areas are characterised by widely different archæological types. As in Zoology or Botany it cannot be predicated of a typical form that it may not vary, or cease to exist in other areas, so neither can it be affirmed of an archæological type that it will necessarily be constant over any hypothetical area. The question which is always to be determined is, *What is the area of the occurrence of the type?*

and this is a question of observation, and not of induction. And as archæological types not only differ in different areas, but are known to have differed widely at different times within the same area, it is clear that the science must necessarily imply a series of investigations carried to completely exhaustive results in many different areas of the earth's surface before they can be compared and combined to form a science of archæology in its general or universal sense. But as no single area has yet been exhaustively investigated, the practical scope of archæology, for the present, may be defined to be the prosecution of the investigation to exhaustive results on their own areas by the more cultured nations. The basis of all scientific knowledge of archæology in every national area must be such a general collection of the remains of its human occupation as will be completely representative of all the various manifestations that have characterised the progress of its people towards the existing culture and civilisation. Hence in every country in which culture is not at a low level, a national collection of the monuments and relics of the progress and development of its national culture is now in process of formation. As the scientific knowledge disclosed by these national collections must necessarily increase in precision and value, according to the nearness of the approach of the collection to a thoroughly exhaustive representation of the area from which it is drawn, the science must be progressive in its results, and its conclusions can only be regarded as final when the collection of materials is complete. When the several national collections have reached this stage of representative completeness, a new departure of the science, in the direction, first, of comparative archæology, and secondly, of general archæology, will become possible.

In the meantime, the results of investigations have established, for the greater part of Europe and some parts of Asia, a series of stages of progress of industrial culture, marked by the successive use of stone, bronze, and iron, as materials for the fabrication of cutting tools and weapons. These stages of progress, when applied to a national area like that of Denmark, in which this division of prehistoric culture was first formulated, are spoken of as the Stone Age, the Bronze Age, and the Iron Age of the prehistoric inhabitants of that country. As these terms do not imply absolute divisions of time, and as they cannot be used unless with relation to the condition of a people, it follows that their succession was neither necessarily nor probably synchronous in different areas, and the same has to be inferred of their duration. The estimates, in terms of years, of the time that may have elapsed since the appearance of man in Europe with the passing of the Glacial Period have varied very widely, 100,000 and 4000 years representing the extremes. For South Scandinavia, De Geer gives the date of the end of the last glaciation as about 10,000 B.C., his method being to count the number of layers of sediment deposited annually in the sea by the summer melting of the ice during its retreat, adding thereto the number of similar layers, which, immediately after its uncovering by the retreating ice, began to be set down in Lake Ragunda to the north. The estimates of the duration of the three ages in the several parts of Europe are also various. Worsaae estimated the Stone Age in the Scandinavian north as from 3000 B.C. to 1000 B.C., the Bronze Age from 1000 B.C. to the Christian Era, and the Iron Age ending with the close of the Viking period, about 1000 A.D. Montelius gives for Sweden: the Stone Age ending about B.C. 1500, the Bronze Age from B.C. 1500 to B.C. 500, and the Iron Age from B.C. 500 to A.D. 1000. Sir John Evans gives 'with

all reserve' 1200 or 1400 B.C. as the probable close of the Stone Age, and beginning of the Bronze Age in Britain, and about 400 B.C. as the probable commencement of the Iron Age of Britain. But all such approximations must be taken as merely guesses at the probable dates they seek to represent. Sir W. Boyd Dawkins puts the case quite clearly when he says: 'The measurement of time absolute in terms of years, outside the reach of history, is beyond our power.' As a matter of fact, prehistoric archaeology has no dates. But archaeology, like geology, has a chronology of sequences, ascertained from observation and comparison of the deposits, and the types of their associated contents, which is sufficient for scientific purposes.

The study of archaeology in any given area is thus a study of all the remains of man and his works occurring within that area, with the view of determining their relations to each other in time, and ascertaining their typical relations with corresponding remains in other areas. It includes the story of industry and art, and the development of human culture from its lowest to its highest manifestations; and also the history of civilisation, or the progress of aggregate communities, from the first simple principles of combination for mutual helpfulness, to the highest manifestations of social and political organisation.

Applied to the British area, archaeology reveals that Scotland, like Denmark, Norway, and Sweden, discloses no undisputed evidence of its occupation by man in the earliest period of the Stone Age, when the human species was, in certain other areas of Europe, contemporary with a group of extinct animals, these earliest remains being confined to England south of the Humber. But the whole area of England and Scotland presents traces of the cairn-builders of the closing portion of the Stone Age, who buried their dead in chambered cairns, and possessed the domestic animals still common in these countries. Their urns, or funerary pottery of fire-baked clay, were wide, shallow, round-bottomed vessels, decorated with rectilinear ornamentation, or pitted with the finger-nail. Their weapons were bows and arrows, tipped with well-made triangular or lozenge-shaped points of chipped flint, and axes of different varieties of polished stone. The Bronze Age is represented by a different set of burial customs, in cairns that are not chambered, the bodies being deposited singly, in cists of slabs, and accompanied by flat-bottomed urns, tall, or tapering to a narrow base, with rectilinear ornamentation encircling the exterior surface in bands. This system of single burial in cists, in place of aggregate burial in the chambers of a cairn, which distinguishes the Bronze Age sepulchral deposits from those of the Stone Age in Britain, prevails not only in the unchambered cairns, but in the barrows or artificial mounds of earth, and common cemeteries, or groups of interments in natural mounds and ridges of gravel and sand, as well as in the monumental cemeteries surrounded by circles of standing stones. The customs of cremation and unburnt burial appear to have existed side by side throughout the Bronze Age. The implements and weapons of the Bronze Age were made of an alloy of copper and tin, in the proportion of about nine parts of copper to one of tin, and were cast in moulds of stone or hardened clay, and their edges hammered fine and planished with a whetstone. They consist of knives of several varieties of form, daggers, swords, spear-heads, shields, axes of three varieties of shape—flat, flanged, and socketed—chisels, gouges, sickles, &c. The personal ornaments were made of bronze, but frequently also of gold, and consisted chiefly of penannular bracelets, necklets, diadems, and ear-rings. Throughout the Bronze Age flint arrow-heads continued to be used; and

polished stone ornaments, such as bracers to protect the wrist from the recoil of the bow-string, and beads and necklaces of jet and amber, were common. The Iron Age introduces a system of curvilinear ornamentation of peculiar character for the surface decoration of objects of personal use and ornament, which still continue to be made of bronze or gold, though silver is now also common; and all the cutting implements and weapons are made of iron. The burial customs of the Iron Age are not fully disclosed for Scotland; but in the neighbouring area of the north of England the custom of burial in barrows, without cists of stones or sepulchral urns, but accompanied by horses and chariots and their harness and furniture, is shown to have prevailed. In the early Christian period, when grave-goods ceased to be buried with the dead, the archaeological interest is transferred from the underground phenomena of the burial to its overground manifestations in monumental symbolism and memorial sculpture. The symbolism appears to have been developed into a system peculiar to the Scottish area; but the art of the memorial sculpture corresponds with that of the illuminated ornamentation of the early Celtic manuscripts of Gospels and Psalters, and with the decorative patterns of such articles of Celtic metal-work as chalices, crosiers, book-covers, and brooches of the same period. After the 12th century, the Celtic style of decorative art gave way to the European styles, introduced by freer contact with Continental influences; but the national style exerted a strong influence upon the monuments of the West Highlands and Islands of Scotland until the Reformation, and lingered in the decoration of brooches of brass and silver, the carving of dirk-handles and powder-horns, and the tooling of leather-coverings for targets, till after the last Jacobite Rebellion.

In former days our knowledge of past times was wholly derived from history and tradition. Their remains were regarded as the work of the gods, or assigned conjecturally to some race or order of historic fame, as the stone circles of Britain were given to the Druids, bronze weapons and implements to the Romans or Phœnicians, and the sculptured monuments of Scotland to the Danes. The professed antiquary of the 18th century, bound by the traditions of scholarly research, did little in the way of original investigation; but he unconsciously laid the foundation of the science by his passion for collecting. When the articles were brought together, classification suggested itself, and general deductions became for the first time possible. Thus flint axes and arrow-heads, stone whorls and variegated beads, ceased to be credited with superstitious attributes as thunder-bolts, elf-shot, amulets, and adder-stones, and came to be recognised as materials of science, capable of being utilised for the increase of knowledge. The formation of societies for the promotion of the study was a great step in advance. The Society of Antiquaries of London was incorporated in 1751, and the Scottish Society in 1780. The number of provincial and local societies has increased enormously, and their publications form an extensive body of archaeological literature. The first systematic researches among the actual remains of antiquity were made by Rev. Bryan Faussett among the Anglo-Saxon tumuli of the Kentish Downs from 1757 to 1773. He was followed by Rev. James Douglas, who published his *Nenia Britannica, or a History of British Tumuli*, in 1793. Sir Richard Colt Hoare issued an account of his explorations of the tumuli of the Wiltshire Downs in 1820. More recently, the investigations of the tumuli of Derbyshire by Bateman, and of the barrows of Yorkshire and the north of England by Greenwell and Rolfe-

ston, have supplied much authentic information of the burial customs of primitive times.

An extraordinary impetus was given in another direction by the announcement in 1847 of the discovery by M. Boucher de Perthes, in the valley of the Somme, of certain rude types of implements of flint in river-gravels enclosing remains of extinct animals. Though at first received with incredulity, these discoveries were afterwards amply verified, and the river-drifts of England, from Salisbury Plain in the south to the Yorkshire Ouse in the north, were found to yield the same forms of implements in similar association with remains of such extinct animals as the mammoth and woolly-haired rhinoceros, thus extending the antiquity of man far beyond the period of the tumuli and the surface finds, to which his remains had been hitherto supposed to be confined. Dr Schmerling, in 1833, had published his researches in the caves of Liège, in which he had found flint implements of similar types, also associated with remains of extinct animals; and his discoveries were subsequently confirmed and extended by those of M. Dupont in the caves of Belgium, of Messis Laet and Christy in the caves of Dordogne in France, and of Mr Pengelly and Sir W. Boyd Dawkins in those of England. In consequence of these discoveries, the Stone Age has been divided into two periods—*Palæolithic* and *Neolithic*, the former characterised by the use of flint implements fashioned and finished by chipping alone, as found in the river-drifts, or in the caves, which also yield evidence of an extraordinary faculty for art possessed by palæolithic man, who has left on their walls wonderfully spitted and characteristic drawings in pigment, or incised outline, of the animals he hunted, including the mammoth, urus, rhinoceros, and others now extinct in Europe, reproductions of which, in a series of monographs, have been issued by the Prince of Monaco, forming a splendid and convincing record of the subject. The discovery of the Swiss lake-dwellings in 1854, and their systematic description by Dr Keller, gave another impulse to investigation which extended the area of this phase of primitive life to Italy, Germany, and Austria. Lake-dwellings had been previously known and described by their Celtic name of *clannogs* in Scotland and Ireland, although their character and contents had been but little investigated. To elucidate the ancient modes of life, the habits and customs of modern savages have been studied, and the results applied to archaeology by Avebury, Tylor, and Barton. Sociology, or the phenomena and methods of the development of civilisation, have been investigated by Herbert Spencer and Sir Arthur Mitchell. The exploration of historic sites, of which Layard was the pioneer at Nineveh, has been continued, with very important results, by Schliemann in Asia Minor and Greece, by Flinders Petrie in Egypt, by Evans in Crete, and by many others in these and other countries.

There are lectureships of archaeology at Oxford, Cambridge, and Edinburgh, and English schools of archaeology have been founded at Athens and Rome. Nearly all European governments have taken measures for the protection of ancient monuments; and in Denmark, Holland, and France the government has provided for the purchase of the sites of such monuments from the owners, in order to preserve them as national property. In Britain an act of parliament has been passed for the protection of ancient monuments, and subsequently royal commissions have been appointed for Scotland, England, and Wales to make a survey and inventory of these monuments and specify those worthy of preservation. Special provision has also been made for the ingathering of prehistoric relics

to the different museums of national antiquities. The Royal Museum of Old Northern Antiquities at Copenhagen, established in 1816, and classified by Thomsen and Worsaae on the basis of the succession of the three ages now universally adopted, contains a completely representative series of the prehistoric antiquities of Denmark, one of its special features being the remains from the Kjekkenmoddings of the Baltic coast. The National Museum of France at St Germain, near Paris, has for its special feature the extensive collections from the river-drifts and the Dordogne caves. The national museums of Norway and Sweden, on the other hand, exhibit the remains of the Iron Age as they are nowhere else represented; while the museums of Zurich and Constance are specially rich in the lake-dwelling remains so characteristic of Switzerland. At Rome, the new Archaeological Museum, under the direction of Pigorini, rapidly filled with the prehistoric remains of Italy; while the Vatican collection is rich in the remains of the Early Christian period. At Naples, the objects disinterred from the buried cities of Herculaneum and Pompeii are gathered into a museum of unrivalled interest. At Athens, the discoveries of Schliemann, and the explorations of the Archaeological Society of Greece, have created a national museum of special importance. In Egypt, the museum of Cairo contains the results of the explorations of the tombs of the kings of the early dynasties, and an extensive collection of general antiquities from the valley of the Nile. At Washington, the United States National Museum already rivals the largest establishments of the Old World in the extent and variety of its ethnological collections. The British Museum in London, established in 1755, though rich in its general collections, possessed no department of British antiquities till a full century afterwards. The Scottish National Museum, founded by the Society of Antiquaries of Scotland in 1780, and maintained by them till 1856, when it was gifted to the nation and established as a national institution, and the Museum of the Royal Irish Academy at Dublin, both possess fairly representative collections of national antiquities. For American Archaeology, see AMERICA.

Archæop'teryx, an extinct bird, the remains of which have been obtained in the well-known Solenhofen lithographic stone—a limestone of Jurassic age—which is quarried at Aichstadt in Bavaria. Only two specimens of the archæopteryx are known—one in the British Museum, and the other at Berlin. The bird appears to have been about the size of a rook. It was at first believed to be a reptile, then a transition form between reptiles and birds, but Professor Owen showed that it was a true bird. The anomalous structure which led the first observers astray was the tail, which, instead of consisting of a few shortened vertebræ united together into a coccygean bone, as in all

Remains of Archæopteryx in Solenhofen Stone.
(From Zittel's *Text-book of Paleontology*, by permission of Messrs Macmillan & Co., Ltd.)

known birds, recent or fossil, was formed of twenty elongated vertebræ, each of which supported a pair of quill-feathers. The metacarpal bones were not ankylosed, as in all known birds, from which it also differed in having two free claws belonging to the wing. The long lizard-like tail is not so

anomalous as it at first sight appears, for in the early embryonic condition of the bird the vertebræ are distinct and separate, and the anastomosis which invariably takes place in the subsequent development of the embryo does not occur in the archæopteryx, so that it may be considered to exhibit the temporary embryonic condition of the bird as a permanent structure; and that this is the true position of this singular fossil is further established by the existence of other features which are found only in birds. These are the ornithic structure of the wings and legs, the occurrence of feathers, which are confined to birds, and the existence of a merry-thought (furculum), which is found in no other class of animals. In the Berlin specimen the skull has been preserved. It is shaped like that of a bird; a sclerotic ring is present, and there is a series of conical socketed teeth in the upper and lower jaws.

Archangel (*Arkhangelsk*), the capital of a Russian government, on the right bank of the Dwina, near its mouth in the White Sea. It is the seat of a bishop, and owes its name to the monastery of St Michael. Archangel is the chief commercial city for the north of Russia and Siberia. The port is open from May to November, ice-breakers curtailing the close season. The harbour is about a mile below the town, at the island of Solombaly; and 12 miles below are a government dockyard and merchants' warehouses. The bazaar or mart was built in 1668-84. Archangel has several colleges. The chief exports are timber, wheat, oats, pitch, tar, charcoal, turpentine, linseed, oilcake, flax goods, skins; coal and herrings are imported. The manufactures include cordage, canvas, linen, leather, beer, and sugar. It is connected by river and canal with a great part of European Russia. The town, which is the oldest seaport in Russia, dates its rise from a visit paid by the English seaman, Chancellor, in 1553; an English factory was soon afterwards erected, and a fort was built in 1584. When Peter the Great visited Archangel in 1693-94 the town was in the height of its prosperity, but his later policy after the founding of St Petersburg caused the town to decline. Since receiving the same privileges as the latter town, in 1762, Archangel has increased in prosperity. A narrow-gauge railway to Vologda was opened in 1898. The Great War in 1914, by closing the Baltic and Black Sea, enormously increased the importance and traffic of Archangel, and rapidly led to extensive port and railway improvements. It was occupied by a British force, August 1918 to September 1919. Pop. 45,000.—The population (424,000) of the government of Archangel (173,400 sq. m.), formerly Finnish, is now chiefly Russian. It includes the whole coast region between Finland and the Komi (Ziryansk) province. The land lying within the arctic circle is desolate and sterile, and the people live chiefly by the chase. Southward, immense forests constitute the main wealth of the country. Gold, naphtha, and salt are found in various parts. See also KOLA, WHITE SEA.

Archangel. See ANGEL.

Archangel, a name sometimes applied to *Lamium purpureum* and *L. Galeobdolon*. See DEADNETTLE, but cf. also ANGELICA.

Archbishop (Gr. *arch*-, and *episcopos*, 'over-seer') is the title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province, and also exercises episcopal authority in his own diocese. Occasionally, however, the title has been bestowed upon a prelate of a famous city, without his being made a metropolitan and having suffragans under him. The title arose, in the 3d and 4th centuries, from the provincial synods being held once or twice a year in

the chief town of the province under the presidency of the bishop of the place. Another cause of the origin of the title is said to be the custom of planting new bishoprics as Christianity spread, a slight supremacy being still retained by the original chief pastor over those newly appointed. In the Oriental Church, the archbishops are still called 'metropolitans,' from the circumstance first mentioned. In the African Church, on the other hand, the term used was 'primus.' The great archbishoprics of the early Church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the 6th century, the Archbishop of Rome has claimed exclusively the name of Pope (*papa*), which early fathers—e.g. St Jerome—apply to all bishops, and occasionally even to presbyters. There is an official letter by Justinian, addressed to 'John, Archbishop of Rome and Patriarch;' and several ecclesiastical constitutions are addressed to 'Epiphanius, Archbishop of Constantinople and Patriarch.' The synod of Antioch, in 341, assigned to the archbishop the superintendence over all the bishoprics, and a precedence in rank over all the bishops of the church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the Patriarchs (q.v.) towards the end of the 4th and during the 5th century, and still more to the pope in the 9th. The archbishops still retained jurisdiction, in the first instance, over their suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in, the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the church; the dispensation of indulgences, and the like. The archbishops further enjoyed the honour of having the cross carried before them in their own archiepiscopate, even in presence of the pope himself, and of wearing the *pallium*.

In England there are two archbishops, of whom the one has his seat at Canterbury, the capital of the ancient kingdom of Kent; the other at York, the capital of Northumbria. But though as ruling over a province, not merely a single diocese, both have enjoyed the rank of metropolitans from the first, the Archbishop of Canterbury has all along enjoyed, not merely precedence as the successor of Augustine and the senior archbishop, but the possession of a pre-eminent and universal authority over the whole kingdom. This pre-eminence is marked in the titles which they respectively assume—the Archbishop of Canterbury being styled the Primate of all England (*metropolitanus et primas totius Angliæ*), whilst the Archbishop of York is simply called Primate of England (*primas et metropolitanus Angliæ*). It is also indicated by the places which they occupy in processions—the Archbishop of Canterbury, who has precedence of all the nobility (excepting those of the blood royal), not only preceding the Archbishop of York, but having the Lord Chancellor interposed between them. Previous to the creation of an archbishopric in Ireland, the authority of the Archbishop of Canterbury extended to that island. The amount of control which belongs to an archbishop over the bishops of his province is not very accurately defined; but if any bishop introduces irregularities into his diocese, or is guilty of immorality, the archbishop may call him to account, and even deprive him. In 1822 the Archbishop of Armagh, who is primate of all Ireland, deposed the Bishop

of Clogher on the latter ground. Writers, however, who maintain the *jus divinum* of bishops over presbyters, do not claim more than a *jus humanum* for a metropolitan over his suffragans; and assert that, though a bishop may overrule a decision made by a majority of his clergy, an archbishop is bound to give way to a majority of the bishops of his province. To the Archbishop of Canterbury belongs the honour of placing the crown on the sovereign's head at his coronation; and the Archbishop of York claims the like privilege in the case of the queen-consort, whose perpetual chaplain he is. The province of York, consisting of the six northern counties and Cheshire, includes twelve dioceses. The rest of England (with Wales till 1920) forms the province of Canterbury, and contains twenty-six dioceses. These include the dioceses of the two archbishops—i.e. the districts in which they exercise ordinary episcopal functions—which were remodelled in 1836. The diocese of Canterbury comprises Kent, except the city and deanery of Rochester, and some parishes transferred by this act; a number of parishes in Sussex called 'peculiarities;' with small districts in other dioceses, particularly London. The diocese of the Archbishop of York embraces Yorkshire, except the portions included in the dioceses of Ripon, Wakefield, Sheffield, Manchester, and Bradford, and some detached districts. The election of an archbishop does not differ from that of a Bishop (q.v.); nor is the form of consecration essentially different, excepting that the oath of obedience to the archbishop is necessarily omitted. He writes himself 'by Divine Providence'—a bishop being 'by Divine Permission'—and has the title of 'Grace' and 'Most Reverend Father in God,' whilst a bishop is 'Lord' and 'Right Reverend Father in God.' The archbishop is entitled to present to all ecclesiastical livings in the disposal of diocesan bishops, if not filled up within six months. Every bishop, created or translated, was formerly bound to make a legal conveyance to the archbishop of the next avoidance of one such benefice in his see.

In England there are three Roman Catholic archiepiscopal sees, Westminster, Birmingham, and Liverpool; in Scotland two, St Andrews and Edinburgh, and Glasgow. In Wales there are one Protestant archbishop (Wales) and one Roman Catholic (Cardiff). In Ireland there are two Protestant and four Roman Catholic. Of the former, the Archbishop of Armagh is primate of all Ireland; the Archbishop of Dublin being primate of Ireland. They formerly sat alternately in the House of Lords, along with three bishops chosen by rotation.

The United States are divided by the Roman Catholic church into fifteen ecclesiastical provinces, each under an archbishop, and each including several dioceses. The Protestant Episcopal church of the United States has about a hundred bishops, but no archbishop. The Roman Catholic church counts in all, throughout the world, 185 archbishops of the Latin rite, besides twenty of the Oriental rite.

Archdeacon, an ecclesiastical dignitary whose jurisdiction is immediately subordinate to that of the bishop. The archdeacon originally was simply the chief of the deacons, who were the attendants and assistants of the bishop in church affairs. His duties consisted in attending the bishop at the altar and at ordinations, assisting him in managing the revenues of the church, and directing the deacons in their duties. From being thus mere assistants, archdeacons in the 5th century began to share the bishop's powers, and step by step attained to an authority in many respects distinct from that of the bishop, and claimed a jurisdiction proper to themselves, and the right to appoint their own subordinates. Several synods protested

against the innovation, and in the 13th century their powers were limited by the establishment of episcopal courts. Their dignity and influence is now very much reduced in the Catholic Church. There was formerly one archdeacon for each diocese in England, but the act following the report of the Ecclesiastical Commissioners in 1836 made two the minimum number, and in some dioceses there are four. No person can be appointed an archdeacon till he has been six years complete in priest's orders. The duty of parochial visitation has long been regarded as belonging specially to this office, and it was by its exercise mainly that the archdeacons attained to the dignity of ordinary instead of delegated jurisdiction. Even in performing this function, however, and in holding general synods or visitations, ordering repairs of churches, and the like, the archdeacon is properly to be regarded as being what the canon law called him, 'the bishop's eye.' The archdeacon is *ex officio* a member of Convocation (q.v.), and in his court hears from the churchwardens any representations of public scandal. The judge of the archdeacon's court, when he does not preside, is called 'the official.' There is an appeal to the Court of the Bishop, or in the case of an archdeacon of an archbishopric, to the Court of Arches. See DEACON, DEAN, PRIEST.

Archduke (Ger. *Erzherzog*). Archduke and archduchess are titles borne till 1918 by all the sons and daughters of an emperor of Austria, and by their descendants through the male line. The title of archduke was gradually assumed, from 1359, by the Dukes of Austria, as a mark of precedence over the other dukes of the empire, and was formally conferred on them by the Emperor Frederick III. in 1453, who himself, as duke, was the first recipient of the imperial gift.

Archegonium. See CRYPTOGRAMIA, FERNS, MOSSES, &c

Archegosaurus, a remarkable fossil saurian reptile. It had four long, slender digits, which obviously supported a longish narrow-pointed paddle,

Archegosaurus: a, section of a tooth; b, scales.

adapted for swimming. Externally, the body was protected by a covering of oblong quadrangular scales, which are preserved in some specimens.

Several species have been described from the Permian. Goldfuss considered them to be a transition state between the fish-like batrachia and the lizards and crocodiles. Owen subsequently described this fossil; he makes it a remarkable connecting link between the reptile and the fish, and on these grounds: It is related to the salamandroid-ganoid fishes by the conformity of pattern in the plates of the external cranial skeleton, and by the persistence of the *chorda dorsalis*, as in the sturgeon, while it is allied to the reptiles by the persistence of the *chorda dorsalis* and the branchial arches, and by the absence of the occipital condyle or condyles as in Lepidosiren, and by the presence of labyrinthine teeth as in Labyrinthodon, which, however, also ally it to the ganoid Lepidosteus.

There is thus in the archegosaurus a blending together of the characteristics of reptile and fish in one animal. It occupies a position between, and equally related to, the salamandroid-ganoid fishes on the one hand and the labyrinthodont reptiles on the other, while the latter conduct us through the Lepidosiren to the perennibranchiate batrachia.

Archelaus, (1) one of the Heraclidæ, the mythical founder of the royal house of Macedonia.—(2) A philosopher of the Ionic school, born at Athens, or, according to others, at Miletus. He was a scholar of Anaxagoras, and flourished about 450 B.C. He was the first to maintain the spherical form of the earth, which he inferred from his observation that the sun does not rise and set simultaneously at all parts of the earth, as must be the case were it a flat surface.—(3) King of Macedonia, a natural son of Perdiccas II., obtained the throne by murdering the rightful heir in 413 B.C. His reign was far better than its commencement, as he introduced several salutary measures, and was a generous patron of art and literature. His palace was splendidly adorned with paintings by Zeuxis, and Euripides was among his guests. He is believed to have been murdered by his favourite, Craterus, in 399.—(4) A distinguished general under Mithridates the Great, sent to Greece with a fleet and a large army to oppose the Romans in 87 B.C. He was defeated by Sulla at Chæronea, and a second time, with immense loss, at Orchomenos, in Boeotia, in 86. Unjustly suspected of treason, Archelaus went over to the Romans at the outbreak of the second war in 81.—(5) The son of the preceding, married Berenice, daughter of King Ptolemy Auletes, in 56 B.C., and ruled over Egypt for the short space of six months during the banishment of Ptolemy.—(6) Ethnarch of Judæa, son of Herod the Great, succeeded his father in 1 A.D., and maintained his position against an insurrection raised by the Pharisees. His heirship to the throne being disputed by his brother Antipas, Archelaus went to Rome, where his authority was confirmed by Augustus, who made him Ethnarch of Judæa, Samaria, and Idumæa, while his brothers, Antipas and Philip, were made tetrarchs over the other half of the dominions of Herod. After a reign of nine years, he was deposed by Augustus, and banished to Vienna, in Gaul, where he died.

Archenholz, JOHANN WILHELM VON (1745-1812), German historian, wrote on the Seven Years' War and on English history.

Archer, FRED (1857-86), won the Derby five times, and was the foremost jockey till he shot himself when delirious with fever.

Archer, WILLIAM (1856-1924), born at Perth, studied at Edinburgh, and became a journalist and dramatic critic in London. He championed and translated Ibsen, wrote on English poets and dramatists, on Macready, and on America. *The Green Goddess* (1921) was a successful melodrama.

Archer Fish, a name given to certain small East Indian fishes of the Acanthopterygious family of Squamipennes or Chaetodontidae, which catch insects by spouting water from their mouths. The drops are surely aimed, and enveloping the desired insect, cause it to fall into the water, where it is instantly seized as prey. *Toxotes jaculator*, one of these species, is a fish about 6 or 7 inches in length, a native of Java and other parts of the Indian Archipelago, and is that to which the name archer fish has been more strictly appropriated. It can

project a drop of water to the height of 4 or 5 feet. *Chelmon rostratus*, also a Javanese fish, possesses the same power, and the Chinese in Java keep it in

Archer Fish (*Toxotes jaculator*).

jars for their amusement, causing it to practise its art by placing insects within its range.

Archery is the art of shooting with the bow and arrow. The use of these weapons was probably known to man at a very early period of his history, and triangular flint arrow-heads, chipped into the requisite shape, are found in all parts of the world, showing that they must have been known and largely used at a period anterior to the discovery of the working of metals. The bow is mentioned in Scripture as having been used in patriarchal times, and we know that all the leading nations of antiquity were acquainted with it. Assyrian sculpture and Egyptian hieroglyphics testify to its use among these peoples, and the Thracians, Cretans, Parthians, and Numidians were held in high estimation as archers. Homer frequently mentions bows; that of Pandarus was made of a goat's horns 'joined and shaped' 'with artful toil,' and tipped with gold. The poet alludes to it as being used, not only as a weapon of war, but in the sports of the arena, and describes a contest at what would now be called 'shooting at a popinjay' or bird fastened to the top of a mast. The Romans, too, did not disdain the use of the bow in warfare, though it probably did not form part of the arms of the regular legions, but was confined to the auxiliary troops. Procopius mentions that in Justinian's African campaign, the cavalry were clad in coats of mail, and were armed with swords and bows and arrows. The emperors themselves occasionally displayed their skill with the bow, and we are told that Gratian, Commodus, and Domitian were all accomplished archers. Asia, however, and not Europe, must be considered the home of the bow, and almost all the oriental nations have excelled in its use. The practice of archery is still a favourite sport among the Tatars, Chinese, and Persians; the Scythians gave their name to a bow shaped like a crescent moon. But no one country or continent can lay claim to the bow as exclusively its own; wherever man is found, he is almost certain to have taken with him his bows and arrows. They are used by Eskimos and Hottentots, South Sea Islanders and South American Indians. In warfare bows and crossbows were, though largely employed, regarded with disdain by the fully armed chevaliers of the middle ages; and Joinville plainly reflects the feeling of the knight that archers and arbalesters were cowards, afraid to meet their enemies hand to hand. Archery was never brought to greater perfection than it was in

England in the time of Edward III. That monarch devoted much attention to the encouragement of the art among his people, and the consequence was that English bowmen were the foremost in the world; and their prowess was amply proved by the large share they contributed to the successes of Cressy, Poitiers, Agincourt, and other battles. The English archers were all armed with the long-bow, while the French principally depended on the arbalest or crossbow, a powerful, but clumsy and unwieldy weapon. Archers continued to form a part of the English army long after the introduction of gunpowder; in 1572 Queen Elizabeth promised to place at the disposal of Charles X. six thousand men, of whom the half were archers. Archery decayed as firearms came into use. Charles I. endeavoured to revivify the art; and at the breaking out of the civil war, an attempt was made to raise a regiment of archers for the service of the king. Highlanders armed with bows, arrows, and quivers, were in the Covenanters' army at Duns Law in 1639. Cossacks similarly armed entered Paris in 1814.

In Scotland, archery never took such deep root as in the sister country, notwithstanding frequent statutory enactments regarding it. Doubtless owing to legislative encouragement, archery was, however, practised with some success throughout the country; but the people did not seem to take to it as they did in England, and Scottish archers never distinguished themselves on a field of battle.

Bows have assumed various forms in different countries, and have been made of several substances. The bows used in England were at first what are called *self bows*—i.e. made of one piece of wood, generally yew, throughout. Yew, however, being often difficult to procure, *backed bows* were introduced formed of two pieces of wood glued and pressed firmly together; and at the present time bowyers largely make *three-wood bows*, a method which is found to give additional pliancy and strength to the weapon. The weight of bows varies according to the requirements of the archer. A boy's bow may be bent with a pull not exceeding 25 or 30 lb., while a man may use one of double that strength. On an average, however, it will be found that a bow of about 42 lb. is most suited to ranges up to a hundred yards, while for greater distances one of between 50 and 60 lb. may be employed.

The manner of shooting with the bow has varied in different periods and peoples. In ancient times, it seems to be certain that the bow was pulled towards the breast, but it was latterly discovered that by drawing it towards the chin or right ear, much greater force was obtained. Of the different modes of quitting the arrow, an elaborate monograph has been written by an American author, Mr Morse. What he designates severally as the 'primary,' 'secondary,' and 'tertiary' release, have all the same inherent fault—viz. that the arrow is held between the finger and thumb while being quitted. This form of release is still practised by some of the North American Indian tribes. The 'Mediterranean loose,' as practised for ages by nations north and south of that sea, is the best practical mode of releasing the arrow. In it the bow-string is drawn back with one, two, or three fingers, or with one and two only, the balls of the fingers clinging to the string, the terminal joints slightly flexed, the arrow kept in its place between the first and second fingers; the thumb straight, taking no part in the release. This method of quitting is found to be practised in regions as far apart as Siberia and the Andaman Islands. Assyrian sculptures show both the primary and the Mediterranean release, but it is probable that the latter was introduced only after the 9th century B.C. It

is supposed, however, to have been known to the Egyptians long before that date.

There is no doubt that early training and constant practice conduce to a wonderful degree of accuracy in the art of shooting with the bow, but the record of many feats of the kind must be taken with a considerable amount of caution; the amount of exaggeration contained in many such narratives has probably given rise to the proverbial phrase, 'drawing the longbow.' As a general rule, it may be held that at a greater distance than a hundred yards, great accuracy of aim is not attained, though marks may occasionally be hit at double that distance. Longer and lighter arrows are used for shooting at the greater distances; for butt shooting they are shorter, heavier, and blunter in the point. It was the boast of the English archers of the olden time that every man pulled a 'cloth-yard shaft.' Such an arrow, however, would be too heavy for very long distance shooting. One of the longest recorded shots in modern days was made with a very light arrow of about 25 inches length, by the secretary to the Turkish embassy in London, in 1794. He shot against the wind 415 yards, and back again with the wind 463 yards. This, of course, was a mere trial of distance shooting, and did not profess to be aimed at any particular mark.

The old English arrow was made of ash, weighed from 20 to 24 pennyweights, and was tipped with steel and feathered with goose feathers. South Sea Islanders show great ingenuity in tipping and barbing their arrows with fish bones and teeth. In South America the arrow-heads are steeped in a strong vegetable poison called curari or wooral, the basis of which is the juice of *Strychnos toxifera*, and which has fatal results in a surprisingly short time. The Bushman employs serpent poison and euphorbia juice. Putrid flesh is said to be used in some South Sea Islands, the poisonous effect of which is more frequently painful than fatal.

The ordinary mode of practising archery as a pastime, with most of the clubs in England, is shooting at targets placed at distances varying from 50 to 100 yards apart. The targets are 4 feet in diameter, and have a gold spot in the centre surrounded by rings coloured red, blue, black, and white with a border of green. Each of these rings possesses a different value, every hit in the gold being counted nine, in the red seven, in the blue five, in the black three, and in the white one. Whoever gets most value in hits wins the match. Another method of shooting is practised by some clubs, especially by the Royal Company of Archers in Scotland; in this, the targets are placed 180, or even 200 yards apart, and are only 3 feet across, or even less. The arrows used are lighter and longer than in ordinary target shooting, and every arrow hitting the target on whatever part, or 'making a clout,' as it is termed, scores two. Should no arrow hit, the nearest within four bows' lengths counts one.

There are a large number of clubs and societies formed for the practice of archery throughout Great Britain. Of these, the oldest is, curiously enough, a Scottish society—the Royal Company of Archers—who constitute the sovereign's Body-guard for Scotland. Their records extend back to 1676, and there are traces of an earlier existence. Almost every notable Scottish family has been at some time or other represented in its ranks. Its affairs are directed by a council, but there are a large body of field-officers; the captain-general—who is always a nobleman of high rank—being Gold Stick for Scotland, the corresponding Gold Stick in England being held by the colonel of the Life Guards. In terms of a charter granted the Royal Company in 1703 by Queen Anne, they perform a service of presenting three barbed arrows to

the sovereign when residing at Holyrood. The oldest existing society of archers in England, if we except the Honourable Artillery Company of London (which was originally a body of archers incorporated by Henry VIII.), is the Royal Toxophilite Society, founded by Sir Ashton Lever in 1780. The Woodmen of Aiden was founded five years later. The Grand National Championships were instituted in 1844 under the laws of the Grand National Archery Society.

For a man, a bow of average length is about 6 feet, arrow about 28 inches; for a lady, 5 feet 6 inches, and 25 inches.

See Ascham's *Toxophilus* (1545); Ford's *Theory and Practice of Archery* (new ed. by Lutt. 1887); Pittis, *Sports and Pastimes of Scotland* (1891); *Archery*, by Walrond and others ('Badminton' series, 1894).

Archives, COURT OF, a court belonging to the Archbishop of Canterbury, anciently held in the church of St Mary-le-Bow (*S. Maria de Arcubus*) in London. The official principal, from 1874 appointed by the Archbishops of Canterbury and York jointly, superseded the Dean of Archives; the court is now presided over by a judge, whose judgments are in some cases final, in some cases allow appeal to the judicial committee of the Privy Council. See ECCLESIASTICAL COURTS.

Archil, or ORCHIL (Fr. *orseille*; Span. *archilla*; Ital. *orceillo*), is a colouring substance obtained from various species of lichens. The archil is not originally present in the lichens, but is developed during a process of putrefaction and fermentation. The lichens, collected from rocks near the sea, are cleaned, ground into a paste with water, placed in tanks, and ammoniacal liquids—such as purified gas liquor or stale urine—added; when, by the combined influence of the ammonia, air, water, and the constituents of the lichens, a violet-coloured matter is generated, which appears for a time to dissolve in the water, but finally falls to the bottom of the vat in the condition of a moist powder or paste. The latter is then mixed with some substance like chalk or stucco, to give it consistence. Archil is soluble in water and in alcohol, to either of which it imparts a violet colour with a good deal of a crimson hue. It contains orcein, which can be obtained as an amorphous red powder, and to which it owes its tinctorial power. It is much employed in the dyeing of silks; but though a brilliant lilac hue is imparted to the fabric, the colour is not a permanent one, being easily acted upon by the rays of the sun. Hence the cloth is first dyed lilac by another colouring matter, and is then passed through an archil dye, which imparts its brilliant hue. Archil is seldom employed to dye cottons, but it is often used, along with indigo, in the dyeing of woollen cloth. Cudbear (q.v.) and Litmus (q.v.) are analogous to archil, and are obtained from the same lichens. The lichens which yield the best archil in largest quantity are *Rocella tinctoria* and *fuciformis*. The former is called the *Archil* plant; it grows very sparingly on the south coast of England, but is obtained in large amount from the Canaries and Cape Verde Islands, and from the Levant. It is of a substance between cartilaginous and leathery, roundish, pretty erect, branching in a dichotomous manner, of a grayish-brown colour, with powdery warts (*soredia*)—the *apothecia* (see LICHENS), orbicular, flat, horny, almost black. That from the Canary Isles is generally regarded as the best. It seldom exceeds the thickness of a pin, and is about an inch and a half in length. *R. fuciformis* now yields perhaps more of the Archil or Orchella weed of commerce than *R. tinctoria*. It differs from *R. tinctoria* chiefly in being not rounded, but flat, and in having the *apothecia* very distinctly

bordered. It grows in similar situations, and is also a native of Britain, but is abundant only in warmer climates, as on the coasts of Africa, Madagascar, &c.

Archilochus OF PAROS flourished about 714-676 B.C., and is regarded as the first of the Greek lyric poets, although the origin of the elegy is claimed for Callinus. Glimpses of his life, especially of the calamities which befell him, were frequently given in his writings. His father's name was Telesicles, his mother was a slave called Enipo. At an early age, becoming entangled in political contests, he abandoned his native place, and led a colony of the citizens to Thasos. While here, as he informs us in some extant verses, he lost his shield in a battle against the Thracians. Subsequently he was banished from Sparta, to which he had gone, either for his personal cowardice or because of the licentiousness of his verses. Having returned to Paros, he took part in the war which broke out betwixt it and Naxos, in the course of which he lost his life. The Delphian oracle pronounced a curse upon his slayer. He was distinguished for the rich variety and vigour of his lyrics. But the most noted characteristic was his satirical bitterness, inasmuch that 'Archilochian bitterness' and 'Parian verse' became proverbial. He scourged his enemies in the most merciless fashion. It is said that Lycambes, who had promised his daughter Neobule in marriage to Archilochus, having failed to fulfil the promise, was so severely satirised by the poet, that to escape ridicule both father and daughter hanged themselves. Among the ancients, Archilochus was ranked with Homer, Pindar, and Sophocles. Even Plato calls him 'the very wise.' Horace, who largely imitated him in his metres, says that 'rage armed Archilochus with his own iambus'—thus emphasising the fact that to Archilochus we owe the application of iambic verse to satire. One of the forms he often used was called after him *Archilochian verse*. He also used trochaic verse, and many of his poems were hymns, elegies, and epodes. The best editions of his fragments are those of Schneidewin and Bergk.

Archiman'drite (Gr. *archi-*, 'chief,' and *mandra*, 'a fold' or 'a convent'), the title of the highest order of superiors of convents in the Greek Church. See ABBOT.

Archimé'des, the most celebrated of ancient mathematicians, was born at Syracuse about 287 B.C. He is said to have been a kinsman of King Hiero, though he seems to have held no public office, but to have devoted himself entirely to science. In regard to mathematics, we cannot estimate fully the merits of Archimedes without an exacter knowledge of the state of the science as he found it; we know, however, that he enriched it with discoveries of the highest importance, on which modern mathematicians have founded their methods of measuring curved surfaces and solids. Euclid considers only a few curved figures in relation one to another, but without comparing them with rectilinear surfaces and solids. The theorems necessary to this transition are laid down by Archimedes in his treatises 'on the Sphere and Cylinder,' 'on Spheroids and Conoids,' and 'on the Measurement of the Circle.' His demonstration that the area of a segment of a parabola is two-thirds of the inclosing parallelogram, is the first real example of the Quadrature (q.v.) of a curvilinear space. In his treatise on spirals, he rises to yet higher investigations, which, however, are not very easily understood, even by masters of the subject.

Archimedes is the only one of the ancients that contributed anything of real value to the theory of

mechanics and to hydrostatics. He first established the truth that a body plunged in a fluid loses as much of its weight as is equal to the weight of an equal volume of the fluid. It was by this law that he determined how much alloy the goldsmith, whom Hiero had commissioned to make a crown of pure gold, had fraudulently mixed with the metal. The solution of the problem suggested itself to him as he was entering the bath, and he is reported to have been so overjoyed as to run home naked, exclaiming, '*ἤρηκα! ἤρηκα!*' ('I have found it! I have found it!') His boast, that if he had a fulcrum or stand-point he could move the world, betrays the enthusiasm with which the extraordinary effects of his newly invented machines inspired him. Among the numerous inventions ascribed to him is that of the endless screw, and the Archimedes Screw (q.v.). During the siege of Syracuse by the Romans, he exerted all his ingenuity in the defence of the city. Polybius, Livy, and Plutarch speak with astonishment of the machines with which he opposed the attacks of the enemy. The improbable story of his having set fire to the ships by means of mirrors, rests on later narratives. When the Romans took the city by surprise (212 B.C.), Archimedes, according to the tradition, was sitting in the public square lost in thought, with all sorts of geometrical figures before him drawn in the sand. As a Roman soldier rushed upon him, he called out to him not to spoil the circle! But the rude warrior cut him down. According to his own direction, a cylinder inclosing a sphere was engraved upon his tombstone, in commemoration of his discovery of the relation between these solids—a discovery on which he set particular value.

His extant works, written in Doric Greek, were edited by Torelli (1792), Heiberg (3 vols. 1880-81), and Heath (1897-1912). *The Method of Archimedes* was discovered by Heiberg in 1906. See Life by Heath (1920).

Archimedes, THE PRINCIPLE OF, is one of the most important in the science of Hydrostatics, and is so called because the discovery of it is generally ascribed to the Syracusan philosopher. It may be thus stated: A body when immersed in a fluid weighs less than it does in vacuo by the weight of the fluid it displaces; or, A fluid sustains as much of the weight of a body immersed in it as is equal to the weight of the fluid displaced by it (see HYDROSTATICS). It is proved experimentally in the following way: A delicate balance is so arranged that two brass cylinders, A and B, may be suspended from one of the scale-pans, the one

under the other. The lower cylinder, B, is solid, or closed all round, and fits accurately into the upper cylinder, A, which is hollow. When the two cylinders are placed upon the one scale, pan-weights are placed upon the other until perfect equilibrium is obtained. The cylinder B is now immersed in water, and, in consequence, the equilibrium is destroyed; but it may be completely restored by filling the hollow cylinder, A, with

water. The amount of weight which B has lost by being placed in the water, is thus found to be exactly the same as the weight of a quantity of water equal to its own bulk, or which is the same thing, to the quantity of water displaced by it. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves they float on the surface, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own bulk, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same weight as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the water displaced by them weighs precisely the same as they do. The toy called the Cartesian Diver illustrates this. Although the principle is generally established with reference to water, it extends equally to bodies immersed in air or any other fluid, for it is the result of gravitation alone, which is universal.

Archimedes' Screw (called also the *spiral pump*), a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Fig. 1 represents it in its simplest form. This consists

Fig. 1.

of a flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. In the position represented in the figure, the lowest bend, *a*, of the tube will be filled with water, and if now the handle is made to turn, as seen from the lower end of the tube, in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water inclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend, *b*. The first bend, *a*, has meanwhile received a second charge, which, after a second revolution, flows into the second bend, *b*, and takes the place of the first charge, which has now moved into the third bend, *c*. When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution, the lowest bend will be charged, and the highest discharged. It will be seen from the figure that there is room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines, the cylinder itself is

hollowed out into a double or triple-threaded screw, and inclosed in a water-tight case, which turns round with it, the space between the threads supplying the place of such tubes as are seen in fig. 1. Fig. 2 represents a double-threaded Archimedes screw of this description, with the case removed in front. It is sometimes found

Fig. 2.

convenient to fix the exterior envelope, and to make the screw work within it, the outer edge of the latter being as close as possible to the former without actual contact. This modification of the Archimedes screw receives the name of water-screw, and frequently of Dutch screw, from its use in Holland for draining low grounds.

Archipelago (from 13th-century Italian *archipelago*, 'the main sea'; Gr. *archi-* and *pelagos*; *archipelagos*, not an old Greek word, is sometimes used in modern Greek), a term given to that part of the Mediterranean which separates Greece from Asia (the *Ægean Sea* of the ancients); but now extended to any sea, like it, thickly interspersed with islands, or rather to the group of islands themselves. All archipelagoes fall naturally into two groups, the oceanic and the continental. The latter either lie close to the mainland, or are so dotted about the sea as to join, like stepping-stones, two continents. Such are the Chiloe, Patagonian, Arctic, and other groups. The oceanic archipelagoes stand alone, and include the Marquesas, the Sandwich Islands or Hawaii, Fiji, and the Friendly Islands. These, as well as Japan, Nova Zembla, Spitsbergen, Franz-Josef Land, and any others loosely called archipelagoes, will receive separate notice in their places. The islands in the Greek Archipelago consist principally of two groups, called Cyclades and Sporades; the first from their *encircling* the sacred island of Delos, the second from their being *scattered* in a wavy line. The former lie to the east of Southern Greece, while the latter skirt the west of Asia Minor. The numerous islands which stud this sea range in size from the merest barren rocks to Crete, with an area of 3326 sq. m. Most are of volcanic origin, with high bluffs rising abruptly from the sea. Many are very fertile, producing wheat, silk, cotton, wine, honey, figs, oranges, raisins, and other fruits. The people of the Sporades are employed in fishing for sponge and coral. The climate is healthy, the men are hardy, and the women noted for their beauty, of a pure Greek type. Of the Cyclades, all belonging to Greece, the principal are: Syra, Delos, Tenos, Andros, Cythnos, Thera, Naxos, Melos, and Paros. The chief islands of the Sporades are: Carpathos, Rhodes, Cos, Patmos, Icaria, Samos, Chios, Lesbos, Lemnos, Tenedos, Imbros, Samothrace, and Psyra, all Turkish till 1912, when Italy occupied the first four as pledges for the fulfilment of the Treaty of Ouchy (see TRIPOLI), and Greece secured the rest, save Imbros and Tenedos. Italy retained Rhodes and the Dodecanese (q.v.) by the Treaty of Lausanne

(1923). The northern Sporades, off Eubœa—Seynos, Icos, Scopelos, Sciathos, &c.—are also Greek. See separate articles; also GREECE, TURKEY.

Architecture is the art of building or constructing. In this country, architecture is usually divided into Civil, Military, and Naval. In the present article we shall confine ourselves to the first, the two others being treated of, the former under the head of FORTIFICATION, the latter under that of SHIPBUILDING.

The construction of bridges, and especially stone bridges, piers, quays, &c., is just as much a department of architecture as of civil engineering, though in modern times the principle of division of labour has been introduced, and this department has been assigned to the engineer.

Civil Architecture has a scientific or constructive side, and an æsthetic or artistic side. The first relates to the strength, the safety, the convenience, and the comfort of a building, as well as to the nature of the materials used in its construction. The second relates not only to the forms and proportions of its principal features, but to its decorative character, produced by such details as columns, mouldings, tracery, carving, applied sculpture, and inlaying, which in all good architecture are founded on the constructive elements.

The constructive part of architecture, including masonry, carpentry, ironwork, and minor matters, is dealt with under BUILDING. Rude stone monuments are such as consist of separate stones or remains of very rude construction. Dolmens, cromlechs, stone circles, and the Scottish brochs are examples of these, and are treated under their several heads. Every nation which has risen above the condition of the savage has adopted some special mode of building suitable to its wants, its climate, and its customs. This is invariably accompanied with a certain style of decoration, arising from the peculiar genius and surroundings of each people. Such styles are usually very persistent in each race, and are handed down traditionally from age to age, and carried from one country to another. Thus the ancient monuments of a country generally serve as a sure index of the people who inhabited it at the time of their erection, just as the names of places preserve the language of their early occupants. Through commercial and other intercourse, the artistic traditions of one country came to be adopted in others, and received different developments in each, as nations rose and fell in the progress of civilisation.

The later and more refined architecture of a country is generally based on some primitive, simple idea. Thus, in the early and rude times of nearly all nations, it has been the practice to erect a large single stone, or to heap up a pile of stones, as a monument to commemorate some great event. In Egypt and elsewhere we see this primitive idea preserved and developed in the great pyramids and obelisks of a later and more cultivated age. Under the Romans, a similar tradition is exemplified in the sumptuous mausoleums and commemorative pillars of the empire.

In the construction and decoration of buildings, the same principles hold. However elaborate and diversified the edifices of different times and countries may be, all their styles may be traced back to the two chief building materials of wood and stone. Every principle of architecture may be shown to be founded on the forms naturally adopted for construction in one or other of these materials. Wooden construction manifests itself in upright pillars with beams laid across them, hence called the *trabeate* system, while genuine stone building is distinguished by the employment of the arch with its necessary abutments. Most of the nations of antiquity, notably Egypt and Greece,

although acquainted with the use of the arch, preferred not to employ it in their monuments, but to adhere to the earlier and simpler trabeate type of the pillar and beam; and the details of their architecture, although executed in stone, contain evidences of their wooden origin in the traditional wooden features of triglyphs, metopes, &c.

The arch was well known to the Egyptians and Assyrians, and was used by them in tunnels and drains, but it was never adopted as a leading feature in architecture till about the time of the Roman empire. This emblem of true stone architecture, once permitted to take a prominent place in their edifices, soon showed its power by completely revolutionising the whole system. The external architecture, which the Romans had borrowed from the Greeks, was gradually converted into an internal architecture resulting from the development of arch-construction. From this principle, first adopted by the Romans, the whole of the subsequent architecture of Byzantium and the middle ages was evolved.

We thus see that the essential principles common to all architecture were handed down from one country and from one state of civilisation to another. In the same way, the decorative features developed in one age and country had great influence on succeeding nations. Egyptian art influenced Assyrian both in general forms and details, and both lent their aid to the Greeks; although that influence is now recognised to be much less than was believed before the discovery of the imposing remains of Minoan architecture in Crete (q.v.) since 1900. The moulding of Roman by Greek art is very apparent in every feature, while the influence of the latter on Byzantine and Gothic, although more subtle, is none the less powerful.

This article treats very briefly of the history of the various styles of architecture, of which more details are given under their separate headings.

Egyptian.—The history of architecture may be said to begin with the construction of the Egyptian Pyramids, 3000 years or more before the birth of Christ, but it is long after this—namely, 2570 B.C.—ere we find in Egypt a form of structure which contains the germ of a style practised at a later age in Greece. One or more of the tombs at Beni-Hassan are of the latter date, and have pillars which have so much in common with the style of those of the earliest Grecian temples, that they have been said to belong to a pre-Doric order. No doubt the great temples at Thebes, Karnak, and other places, built at a still later time than these tombs, more or less determined the general forms of buildings of a similar nature subsequently erected in Assyria.

Assyrian.—Assyria comes next to Egypt for the age and importance of its buildings. The remains of some of these, which are chiefly palaces, are of great splendour. Among the oldest hitherto excavated is the North-west Palace at Nimrud, built about 884 B.C. Their peculiar style of architecture is familiar from the discoveries of Layard and his successors at Nineveh.

Persian.—Persia possesses in the remarkable ruins of palaces at Persepolis and Susa, built in the 5th and 6th centuries B.C., remains which bear a close resemblance to those of Assyria. The constructional parts of these Persian buildings being chiefly of marble, where those of the Assyrians were of wood, have been much better preserved. French explorers have discovered at Susa, a portion of an ancient palace built of bricks faced with enamelled colours. Fergusson pointed out that the Greeks got their first idea of the Ionic capital from buildings in Assyria and Persia. Indeed, he considered that the earliest form of the Corinthian capital could likewise be traced to these sources.

Indian.—Examples of almost every kind of construction, both in wood and stone, are to be found in the various styles of this wonderful country. Until recent years, it was believed that the cave-temples of India were of a very early date, but it has now been ascertained that none of these go further back than the 6th or 7th century of our era. All other ancient monuments in India, with the exception of the topes or pillars erected by the powerful ruler Asoka, are of still more recent date.

Greek.—Ancient Greek architecture is almost wholly represented by temples and theatres, the remains of which are found not only in Greece itself, but in Southern Italy, Asia Minor, and certain districts in North Africa. Some of these, as their ruins show—notably the temple of Diana at Ephesus—were originally of great size; and their architecture, even in its minutest details, is of a very refined character. The Grecian style embraces three orders, called the Doric, the Ionic, and the Corinthian. The most marked, though not the only distinguishing feature in these, is the capital of the column. The architecture of ancient Greece flourished from 650 to 324 B.C.

Roman.—The Romans borrowed their early architecture from that of Greece and Etruria, but about Roman buildings erected much before the Christian era very little is known. In Egypt, Assyria, Greece, and Etruria, architecture was chiefly confined to tombs, temples, palaces, or theatres. The Romans, however, applied it to many other purposes, such as basilicas, baths, bridges, aqueducts, triumphal arches, and domestic buildings. The circular and pointed arch, though known to earlier nations, seems to have been first used as a conspicuous feature by the Etruscans, whose buildings were chiefly tombs and city-walls and gates. From them the Romans borrowed the round arch, and put it to both a constructive and an ornamental use in almost all their buildings. They soon advanced a step further, and applied it as a vault in rectangular and circular edifices. By the Romans, the Grecian orders were modified in their proportions and details, and two others were added—namely, the Tuscan (a variety of the Roman Doric) and the Composite. In many of their buildings, such as the Colosseum, built 80 A.D. (see AMPHITHEATRE), the orders are piled over each other, dividing the great height of the external wall into several tiers or stories. Besides the Colosseum, the Pantheon, the Theatre of Marcellus, and the remains of temples, baths with their great vaulted halls, triumphal arches, and other monuments, still survive as examples of ancient architecture in Rome itself, built between the time of Augustus in the last century B.C., and that of Constantine in the 4th century A.D. At Pompeii, there are interesting examples of the domestic architecture of the 1st century of our era. Many important ancient Roman remains are likewise found not only in Italy, but in other countries subject to the empire in Europe, Asia, and Africa.

Byzantine.—With the establishment of Byzantium as the capital of the empire, the Roman style of architecture was naturally much practised there, and in particular the development of the dome became from the first a chief object with the eastern architects. Christians were first allowed to erect places of worship in the reign of Constantine the Great. The old basilicas, or courts of justice, were then turned into churches, for which they were well suited. Professor Baldwin Brown, of Edinburgh, has attempted to prove that the humbler *schola*, or hall of meeting, such as was used by the early Christians, as well as by heathen clubs and associations, rather than the basilica, was the original form of the Christian church. The name Byzantine is, strictly speaking, only

applicable to the Christian architecture of Eastern Europe and Asia Minor, erected from the reign of Justinian to the 11th century; but the style continued in use, in a less pure form, till the Mohammedans subdued the Christian countries of the East. One of the finest buildings in this style is the church of St Sophia at Constantinople, founded by Constantine, but rebuilt by Justinian in 547 A.D. The cathedral of San Vitale at Ravenna, also erected in the 6th century, and St Mark's at Venice, built by architects from Constantinople in the 10th century, are two of the most perfect and interesting Byzantine churches in Italy.

Romanesque is the general term applied to all the various round-arched styles which arose in Western Europe, after the irruptions of the barbarians had ceased. It was founded partly on the Roman remains existing in different countries, and also, to a large extent, on the influence of the still flourishing Byzantine art on the awakening communities of the West.—*Teutonic Romanesque* may be regarded as synonymous with Rhenish architecture. The cathedrals of Spire, Mayence, and Worms are examples.—*Lombard Architecture*, the form of Romanesque practised in Lombardy. Examples of it are to be seen in St Ambrogio at Milan, St Abondio at Como, and the cathedrals of Parma and Piacenza. The Romanesque styles of Lombardy and countries north of the Alps, including the Norman of France and England, prevailed during the 11th and 12th centuries.

Saxon or Pre-Norman.—The Norman style would link on more naturally than this with the Teutonic Romanesque. But the Saxon is prior in point of date, and is the earliest of our native styles. It is simple, and has, as a rule, coarsely dressed masonry. The 'long and short work' of the corners and other parts are very probably imitations of woodwork. In whole or in part, the churches of Bradford (Wilts), Earl's Barton, Worth, Monkwearmouth, and other places in England; and perhaps that of St Regulus at St Andrews, in Scotland, are pre-Norman. But there are some curious problems still to solve about these buildings erected prior to the Norman Conquest.

Norman.—This style is also sometimes called Romanesque. No kind of architecture is better known in England and Scotland than the Norman, owing to the abundance of examples which remain. It is characterised by round-headed openings, by flat buttresses like pilasters, by 'cubical' masonry, and by the richness and quaintness of the carving, especially on many of the doorways and chancel arches of even the smaller churches. In the cathedrals and large churches the pillars dividing the aisles from the nave are very massive. Among the many examples in England may be mentioned the cathedrals of Durham, Canterbury, Peterborough, and parts of Lincoln and Winchester. In Scotland, Kirkwall Cathedral is the most complete example on a large scale; but the abbeys of Dunfermline, Kelso, and Jedburgh are also fine, though fragmentary. The small churches of Dalmeny and Leuchars have rich carving.

Under the general term *Gothic Architecture* (q.v.) some writers include the Norman style. More usually, however, the name Gothic is understood to mean the pointed styles of architecture, which succeeded the Romanesque and Norman.

Early English or First Pointed Style.—As soon as the transition from the Norman to first pointed architecture was complete, the latter was characterised by its narrow pointed or 'lancet' windows, without any, or with only very simple, tracery. Further distinguishing features are high gables and roofs, and simple pinnacles and spires. Buttresses are deep instead of shallow, as in the Norman,

and shafts slender, whether they are simple or clustered. The capital is bell-shaped, either with plain mouldings or with bold and graceful foliage, and the Abacus (q.v.) in this country is round instead of square. The mouldings consist of projecting rounds and deep retiring hollows, which give strong light and shade. In England, Salisbury Cathedral is wholly in this style, so also are the nave and transepts of Westminster Abbey. Scotland has good examples of it in the choir of Glasgow, and in most of what remains of Elgin Cathedral. This style lasted from towards the end of the 12th to near the end of the 13th century.

Transition.—At the former date a change is observable in the window-tracery, the foliage, &c., indicating that the style is gradually altering or undergoing a transition to the

Decorated, Second Pointed, or Middle Pointed Style.—Windows are now divided into a number of lights by comparatively thin mullions, and their upper portions filled with beautiful tracery, which at first was of geometrical forms, such as combinations of circles, trefoils, and quatrefoils. But in the later period of the style, the tracery becomes wavy and flowing, and of almost endless variety. Ordinary buttresses are more enriched than in the earlier style, and flying-buttresses, though not for the first time used, are now common. A continuation of the arch-mouldings, instead of shafts with caps, at length characterises the jambs of the doorways. All the smaller ornaments and foliage are rich, free, and graceful. This is generally considered the most perfect and beautiful style of Gothic architecture. As examples of it, may be mentioned the choir of Lincoln and the nave of York Cathedral; and in Scotland portions of Melrose Abbey. The style continued from about 1274 to 1377. It then gradually stiffened into what is called the

Perpendicular, Third Pointed, or Late Pointed Style.—This is easily distinguished from the previous style by the tracery of the windows, which is characterised by an upright and square tendency. Perpendicular lines prevail in the windows as well as in the ornamental paneling. The doorways have square heads over pointed arches. Gables and roofs are at a low angle. Clerestory windows are more frequently square-headed than arched. It is only in this style that we find the depressed four-centred or Tudor arch, although arches with two centres are also used. Rich fan-tracery (q.v.) appears in the vaulting, and ornamented open timber roofs are frequent (see ROOF). The perpendicular style is not represented in continental Gothic buildings. Westminster Hall, London, is an early example of this style. Henry VII.'s Chapel, Westminster Abbey, has beautiful fan-tracery. Somersetshire is peculiarly rich in churches of this period. In Scotland, the great east window of Melrose Abbey is a good example. The style prevailed from the end of the 14th to the middle of the 16th century. The later portion of this period is sometimes called the *Tudor style*. The elaborately ornamented *Flamboyant* (q.v.) style was the latest style of Gothic in France (15th and 16th centuries). The Municipal Architecture (q.v.) of the middle ages was largely Gothic in type.

Under the head **GOthic ARCHITECTURE** will be found some account of buildings belonging to the different periods of pointed architecture on the Continent.

Roman or classic architecture may be said to have never entirely died out in Rome, and when, in the 15th century, the revival of classic literature and taste took place, the ancient classic style of architecture naturally revived along with them. This is called the *Italian Renaissance*. Buildings,

many of which are famous, erected at Rome, Florence, Venice, and other places in Italy, from the beginning of the 15th to the end of the 17th century, and some would say even later, are included under the general term Italian architecture. The name Renaissance is likewise given to it, but this term is also applied to architectural works erected in other parts of Europe after the decay of Gothic architecture in the 16th century; and in a wide sense it includes all edifices built in a classical (but not when of a purely Greek) style from that time to our own. It comprises so many diversities that it is hardly possible to define it with any kind of precision. Renaissance as applied to architecture means a revival of classical features and details as distinguished from those which characterise the Gothic. St Peter's at Rome; the Pitti Palace at Florence; various palaces on the grand canal at Venice; the Louvre and Tuileries at Paris; the Banqueting House in Whitehall, and St Paul's Cathedral, London, are all examples of Renaissance.

Elizabethan Architecture (q.v.), and the corresponding style on the Continent, is a variety of Renaissance, in which Gothic and Italian features are somewhat mixed. Holland House, near London, as well as Hatfield House, Burleigh House, and Hardwick Hall, in other parts of England, are well-known buildings in this style; so also is Heriot's Hospital at Edinburgh.

Arabian, Saracenic, or Moorish.—This singular and beautiful style of architecture appears to have first taken a definite character in the 9th century, and was probably based on Persian, together with some of the elements of Roman and Byzantine art. The style is noted for its elegant domes, often with remarkable external decoration; for its graceful minarets or towers, lessening in diameter stage by stage as they rise; for the frequent use of the pointed arch, and of the horseshoe arch; and in some cases for the peculiarly slender columns which support the walls above them. The flat or surface decorations are peculiarly striking and effective. These consist of diaper-work, often richly perforated; and of scroll-work of great variety, often of fairy-like lightness. The stalactitic-looking pendentives, filling up such places as the corners of ceilings, have a remarkably fine effect. Several mosques and other buildings at Cairo, a peculiar class of houses in Algiers, and the Moorish palace of the Alhambra, as well as the mosque of Córdoba, in Spain, furnish striking illustrations of this kind of architecture.

Modern Architecture.—This title is generally applied to the architecture which has been used by European nations since the time of the Renaissance. The Renaissance, as we have seen, was a revival of Roman architecture, the study of which naturally led to an acquaintance with its prototype, the architecture of Greece. The examination of Grecian buildings, and the revival of their style, was much encouraged in the 18th century. In the beginning of the 19th century, the habit of imitating ancient styles had been established, and began to be applied to Gothic architecture also, which speedily came to be generally adopted, especially for ecclesiastical edifices. This has been particularly the case in Great Britain, and amongst the Anglo-Saxon race wherever found—in America, India, and Australia, as well as at home. All modern architecture is imitative, and it is doubtful whether a really new style is possible. At present Gothic is generally adopted for churches, and Renaissance for domestic buildings. The Houses of Parliament at Westminster are one great example of an attempt to apply Gothic to a secular building, and the Law Courts erected in London in 1868-82 are another. In France, the birthplace

of Gothic, it is little practised, the French having adopted a special modification of the Renaissance, which is known as the 'French style.' Most of the great modern towns, such as Paris, Lyons, and Marseilles, have been largely rebuilt in this style. In Germany and Italy the purer classic examples have been more frequently followed; but of late there is a strong tendency towards Renaissance, as practised during the 16th and 17th centuries, in Germany, Britain, and America.

See the *Dictionary of the Architectural Publication Society*; the works of Pugin, Viollet le Duc, Parker, Fergusson, Freeman, Fletcher (1922), Statham (1909-13), F. M. Simpson (1905-12), Lethaby, Sturgis and Lethbrugh (1907 *et seq.*), Rivoira, Moore, Bond, Jackson.

Each of the principal styles receives separate treatment at its own alphabetical place (Greek, Roman, Byzantine, Arabian, Romanesque, Norman, Gothic, Early English, Perpendicular, Renaissance, &c.); or in the articles on the several countries (Assyria, Babylon, Egypt, Persia, India, China, Japan). Many important architectural monuments are described and figured in separate articles (Pantheon, Pyramids, Stonehenge, Teocalli, &c.), or in the articles on the places where they are found (Agra, Baalbek, Benares, Edfu, Florence, London, Palmyra, Paris, Persepolis, Philæ, Rome, Salisbury, Thebes, Venice, &c.). See also the articles on the great architects (Michelangelo, Inigo Jones, Christopher Wren, &c.). Other articles on architectural subjects are:

Archon. the highest magistrate in Athens. The government was originally monarchical; but on the death of Codrus (q.v.), the Athenians, according to the traditionary account, resolved that no one should succeed him with the title of king (*basileus*), and therefore appointed his son Medon with the title of *archon* (ruler). The office was at first for life, and confined to the family of Medon; but in 752 B.C. the time of office was limited to ten years; and in 714 the exclusive claims of Medon's family to the office were abrogated, and it was thrown open to all persons of noble birth, afterwards by Aristides to all citizens without distinction of rank (477 B.C.). In 683 the office had been made annual, and the number of archons had been extended to nine. The first archon was styled *Eponimos*, and from him the year was named; to the second, styled *Basileus*, belonged the care of religious affairs; the third was *Polemarchos*, or commander-in-chief; and the remaining six, having to conduct all criminal trials, were styled *Thesmothetes*, or lawgivers.

Archpriest. Archpriest was the title given to the superiors who were appointed by the pope to govern the secular priests sent into England from the foreign seminaries during the period 1598-1621. On the death of Cardinal Allen, in 1594, the missionary priests were left without a head. Dissensions had already sprung up between the secular clergy and the Jesuits. The need of some superior was evident. Some wished for the ordinary government of bishops. The Jesuits desired to keep the control of affairs in their own hands.

Through the influence of Father Parsons, Clement VIII. commissioned Cardinal Cajetan, called the Protector of England, to appoint George Blackwell archpriest, with jurisdiction over the secular clergy of both England and Scotland (March 1598). The archpriest was to have twelve assistants, but among other instructions given to him was an order that in all matters of importance he should consult the superior of the Jesuits in England, at that time Father Garnet. It is said that Parsons's object in thus placing the direction of British Catholics in the hands of one man subservient to the Jesuits, was the better to further the political projects of his own or the Spanish party in view of the succession to the crown. The leading secular clergy protested against the novel appointment as irregular in its institution, made upon false and fraudulent information, and oppressive in its action. They finally (November 1600) drew up a formal appeal, signed by thirty-three priests, and, secretly aided by the queen and council, sent four of their number to represent their cause at Rome. Some of the grievances complained of were at length redressed, and the archpriest's abuse of power and the influence of the Jesuits controlled, but the form of government was retained. Blackwell was deprived in 1608 for taking, and persuading others to take, the oath of allegiance, which had been condemned by Urban V. He died in a London prison five years afterwards.

George Birket or Birkhead, who was appointed in Blackwell's place in 1608, died in 1614. The third and last archpriest was Dr William Harrison, who ruled the clergy in this capacity till his death in 1621. Harrison had himself urged upon Rome the appointment of bishops, while the Jesuits in their turn now sought the aid of the government in opposing it. In 1623 William Bishop, the chief antagonist of Blackwell, and a leader of the appellants, was made titular Bishop of Chalcedon, and vicar-apostolic of England and Scotland.

See *Jesuits and Seculars in the Reign of Elizabeth* (1889), and *The Archpriest Controversy* (1699), both by Dr T. Graves Law.

Archytas OF TARENTUM, who flourished about 400 B.C., was seven times elected general, and was victorious in every campaign. His civil administration was equally fortunate; and he was no less distinguished as a mathematician and philosopher. His virtues were as conspicuous as his talents; he was unselfish, moderate, and humane; and although one of the greatest geometers, he did not disdain to make toys for his children. He solved the problem of the doubling of the cubes, and secured almost the reputation of a magician by his numerous mechanical contrivances, the most wonderful of which was the flying pigeon. A Pythagorean in philosophy, he is supposed to have exerted an influence on Plato, and some affirm that Aristotle was indebted to him for the idea of his categories. Only unimportant fragments of his writings remain. They relate to metaphysics, ethics, logic, and physics. Horace says he was drowned in the Adriatic.

Arcis-sur-Aube, a town of 3000 inhabitants in the French department of Aube, on the navigable Aube, 22 miles N. of Troyes by rail. It was the birthplace of Danton, and near it a battle was fought, March 20-21, 1814, between Napoleon and the allied forces under Prince Schwarzenberg, ending in a French retreat.

Ar'cola (French *Arcole*), a village on the left bank of the Adige, 15 miles ESE. of Verona, famous for the victory gained by Napoleon over the Austrians, 15th to 17th November 1796.

Arcos de la Frontera, a town on the right bank of the Guadalete, in the Spanish province

of Cadiz, 20 miles ENE. of Xeres. It has a romantic situation, on a rocky hill, and was called *de la Frontera*, from its having stood on the frontiers of the old Moorish kingdom of Granada. Almost impregnable by nature, it was furthermore embattled with walls and towers, part of which still remain. It manufactures leather, hats, and articles made of esparto grass; and produces wine, oil, and fruit. Pop. 6000.

Arcot (*Aru-Kadu*, 'six deserts'), a city of British India, in the presidency of Madras. It is situated on the right bank of the Palar, 2 miles from Ranipet railway station, and 65 WSW. of Madras. Besides the military cantonment, which can accommodate three regiments of cavalry, Arcot contains some mosques in a tolerable state of repair, and the ruins of the Nawab's palace. In 1751 Clive, with 300 Sepoys and 200 Europeans, marched against Arcot, which was garrisoned by 1100 men; and after having taken it, had in his turn to withstand a siege of fifty days. Arcot was afterwards captured by the French, but retaken by Colonel Coote in 1760. It was taken and held for a time by Hyder Ali, but passed into the hands of the British in 1801. Pop. (1921) 11,430.

The districts of NORTH and SOUTH ARCOT, especially North Arcot, are dependent on tanks in the dry season, and have suffered severely from famines. Area of North Arcot (as reduced in 1909), 4920 sq. m.; pop. (1921) 2,055,594; area of South Arcot (as reduced in 1909), 4208 sq. m.; pop. (1921) 2,320,265.

Arctic means, properly, lying near the constellation of the Bear (Gr. *arktos*) or Ursa Major (q.v.), and hence, northern. The Arctic Circle is a circle drawn round the North Pole, at a distance from it equal to the obliquity of the ecliptic, or $23\frac{1}{2}^{\circ}$. The corresponding circle round the South Pole is the Antarctic Circle. Within each of these circles, there is a period of the year when the sun does not set, and another when he is never seen, this latter period being longer the nearer to the pole. The word is also used figuratively to express extreme cold.

Arctic Animals. The region north of the cultivation of cereals is peopled by a limited and homogeneous fauna. Mammals are represented almost exclusively by ruminants, carnivores, and rodents, such as the Arctic fox, polar bear, glutton, ermine, sable, walrus, tail-less hare, lemming, reindeer, and musk-ox. Birds are represented especially by the snow-partridges, snowy owl, Iceland falcon, eider-duck, auks, divers, and guillemots. No reptiles can live in the cold of the arctic regions; but fishes, especially Salmonidae, are well represented. Insects and molluscs are fairly numerous. Not a few of the birds and mammals inhabiting these snowy regions exhibit adaptive characters of white colour, thick coats, accumulations of fat, and the like. See GEOGRAPHICAL DISTRIBUTION; Pennant's *Arctic Zoology*; Heilprin's *Distribution of Animals* (1887); and the observations of Nordenskiöld, Nansen, Peary, &c.

Arctic Ocean. The Arctic Ocean lies to the north of Europe, Asia, and North America, and surrounds the North Pole; it is usually defined as the water area within the Arctic Circle. The influence of the Gulf Stream, however, carries a relatively mild climate a long way within the Arctic Circle off the coasts of Norway; and, on the other hand, the Arctic currents along the east coast of Greenland, and through Davis Strait, bring down Arctic conditions a long distance into the Atlantic. Physiographically, the Norwegian Sea and Greenland Sea, situated between Norway and Greenland, belong to the same basin as the Arctic Ocean, which is cut off from the Atlantic by the

ridges stretching between Greenland, Iceland, the Faøe Islands, and the north of Scotland—these having an average depth over them of 240 fathoms. If the Arctic Ocean be regarded as lying wholly within the Arctic Circle, then it is almost landlocked between that circle and the parallel of 70° N. It communicates with the Pacific by Behring Strait, and with the Atlantic through Davis Strait and the wide sea between Norway and Greenland. The area of the ocean is about 5,000,000 sq. m., and into it there drain about 8,660,000 sq. m. of land. The rainfall on this land is estimated at 2100 cubic miles per annum. The coasts of Europe and Asia are low, and have several deep indentations, the principal being the White Sea and the Gulf of Obi. The shores of North America are skirted by a most irregular assemblage of islands, forming numerous gulfs, bays, and channels. The principal islands of the Arctic Ocean are Greenland, Spitsbergen, Franz-Josef Land, Nova Zembla, New Siberia, Wrangel Island, Prince Patrick Island, Melville Island, Banks Land, Ellesmere Land, Grienell Land, &c. In 1913 a Russian expedition under Captain Vilkiitsky reported the discovery of land (Nicholas II. Land) to the north of Cape Chelyuskin, in Eastern Siberia, stretching some 200 miles up to 81° N., 96° E. The principal rivers from Asia are the Lena, Yenesei, and Obi; from Europe, the Onega, Dwina, and Petchora; from America, the Mackenzie. The Arctic highlands are covered with an enormous depth of snow and ice. In some places this results in the formation of great glaciers, one of the most remarkable of which is the Humboldt Glacier, in 79° N. lat., on the west coast of Greenland. The whole ocean is covered by immense ice-fields from 5 to 50 feet in thickness. During winter these are bound together by the severe frost, but these continuous masses break up during the summer months into floes and floe-bergs. Sometimes vast spaces of water and long lanes are formed between the floes and ice-fields, and these have, doubtless, given rise to the notions regarding an open Polar Sea which at one time prevailed. When these great floating ice-fields come together, the margins where they collide are piled up on each other, and thus the well-known hummocky ice-floes are produced. When this hummocky ice is jammed against a shallow shore, and becomes fixed for long periods of time, the appearances are produced to which Nares gave the name of 'Palæocrystic Sea.' In the more open parts of the ocean the ice is, however, always in motion. Immense quantities of field and hummocky ice pass down each year between Spitsbergen and Greenland, and Greenland and Iceland, these waters being almost always blocked. Frozen in this ice, whole pine-trees are not uncommonly found; these have most probably been carried right across the pole, after having been carried into the Arctic Ocean by the rivers of the Old and New World. Large fresh-water ponds and lakes are formed on the ice-fields during summer by the rain and melting snow. When these are frozen again, a 'black ice' is formed, which contrasts strongly with the 'white ice' formed from salt water. The whalers supply themselves with water by picking up the 'black ice.' Peary found, as he travelled over the ice north of Spitsbergen, that it was moving in a body to the south. He reached a latitude of $82^{\circ} 45'$, Markham reached $83^{\circ} 20'$, Lockwood (1882) $83^{\circ} 24'$, Nansen (1895) $86^{\circ} 14'$, Cagni (1900) $86^{\circ} 33'$, and Peary (1909) the Pole. In 1850 McClure entered Behring Strait, and brought his crew home by Davis Strait, thus discovering the *North-west Passage*. In 1878 and 1879 Nordenskiöld sailed from the Atlantic to the Pacific along the northern shores of Europe and Asia, thus discovering the *North-east Passage*.

Nansen (q.v.) found that the depth suddenly increased north of the New Siberian islands from 100 fathoms to 1800 or 2000; below the cold layer of 200 fathoms the water was warmer by as much as 2.4° C. than at the surface (-1.6° C. and +0.8° C.). The pole is probably in deep water. Cold Arctic water penetrates the Faroe Channel, but is stopped by the Wyville-Thomson Ridge; on the north of this ridge there is, at a depth of 400 and 500 fathoms, a temperature of 30° F.; while on the south side, at the same depths, the temperature is 45° F. The width of this ridge is about 10 miles, and on it there is a depth of 250 fathoms. The warm Gulf Stream water flows over this ridge and on to the coasts of Norway, rendering its northern shores and those of Lapland relatively mild and habitable, the July temperature off the North Cape being 47° F. Musk-oxen, reindeer, foxes, hares, and wolves are met with on Arctic land. Polar bears roam widely over the ice-fields. Whales, walrus, narwhals, and seals abound. Guillemots, little auks, gulls, and other sea-birds are found in vast numbers near Spitsbergen and other islands. Eider-ducks nest on the low lands. There is a great amount of invertebrate life at the surface of the sea, and diatoms are also abundant. The Norwegian expeditions show that life exists at great depths, but it is by no means so abundant as in the Antarctic. The ocean appears to be shallow to the north of Europe and Asia, the depth 500 miles to the north of the Lena being only 38 fathoms; and Markham found only 72 fathoms at his most northerly point off the American coast. Between Spitsbergen and Lapland the depths are from 100 to 200 fathoms; but between Spitsbergen and the north of Greenland there is a deep opening into the frozen sea, where the depth is 2500 fathoms. Between Norway and Greenland the depths in some places are over 2000 fathoms, and generally over 1000 fathoms in the central parts. The depths in Behring Strait are less than 100 fathoms. The deposits in the Arctic Ocean are blue muds, composed almost wholly of land débris. In the south-east portions of the Norwegian Sea, some of the deposits approach in character to a globigerina ooze. South-westerly winds prevail along the coasts of Norway, and as far as Franz Josef Land; to the westward of this line north-easterly winds prevail. In winter winds blow from Northern Asia to the Arctic Ocean; in summer, from the ocean to the land. The direction of the winds over the Arctic Ocean at different seasons is controlled by the positions of the barometric maxima and minima in the north parts of Asia and the North Atlantic. Fogs and mists are of most frequent occurrence during the six months of day and summer. In winter the temperature of the air is sometimes as low as -47° F., and in summer is usually a little above the freezing-point. The absence of large flat-topped tabular icebergs, like those of the Antarctic, is adduced as evidence that there is no expanse of land towards the Pole; but Dr R. A. Harris argues from the tides, &c., that an Arctic continent of 500,000 sq. miles lies in the unexplored Beaufort Sea between the Behring Strait and the Pole; and Peary sighted Crocker Land in this region. See also POLAR EXPLORATION.

Arctium. See BURDOCK.

Arctomys. See MARMOT.

Arctus Senilis (Lat., 'the bow of old age'), a narrow white or yellowish band close to, but within the margin of the cornea (see EYE), caused by fatty degeneration of its tissue. It usually begins during middle life, first at the upper, then at the lower part of the cornea; before old age is reached, these two arcs have generally united at

the sides to form a ring. It is frequently associated with Atheroma (see ARTERIES, *Diseases of*), but it is of no other practical importance.

Ard. or **AIRD**, a Celtic root, meaning 'height' (cf. Lat. *arduus*, 'high'), which appears in many geographical names, especially in Ireland and Scotland.

Ardahan, a village in Armenia, 35 miles NW. of Kars. Its position gives it strategic importance. Its fortress was dismantled by the Russians in the war of 1854-56; in 1878 the Berlin Congress sanctioned the cession to Russia of Ardahan, which had been captured early in the war. The Russians gained an important victory over the Turks concentrated here on 3d January 1915. On account of the severity of the climate, the houses of Ardahan are mainly constructed underground.

Ardalan, a province in the west of Persia, embracing the basin of the Shirwan Rûd. It is generally mountainous, but the valleys are very fertile, and if well watered, yield cereals and fruits in abundance. Area, 6000 sq. m.; estimated pop. 150,000. Capital, Kermanshah (q.v.).

Ardea. See HERON.

Ardebil, a town of Persia, in the province of Azerbaijan, 110 miles E. of Tabriz, and some 5000 feet above the sea. Pop. about 10,000.

Ardèche, a department in the south of France, takes its name from a tributary of the Rhone, and includes part of ancient Languedoc. It is almost wholly mountainous. In the NW. of the department, the Cévennes culminate in the volcanic Mont-Mézenc, 5752 feet in height. Numerous extinct volcanic peaks, deep craters, grottos, rock-labyrinths, and basaltic columns give an extraordinarily picturesque appearance to the scenery. The upland, where winter reigns for six or eight months, is devoted to pasturage; but the valley of the Rhone produces wine, olives, chestnuts, figs, and almonds. Only a fourth of the area is cultivated. Iron, coal, antimony, lead, marble, and gypsum are wrought. There are manufactures of silk, paper, leather, woollens, gloves, straw. Area, 2136 sq. m.; pop. (1921) 294,308. The capital is Privas.

Ardee, a town in the west of County Louth, Ireland, on the river Dee, 12 miles inland. The ancient castle, built about the year 1200, is now used as the town-house; there is a handsome convent here. Pop. 1800.

Ardennes, an extensive hill-country and forest, occupying the SE. corner of Belgium, between the Moselle and the Meuse, but extending also into France and Rhenish Prussia. It consists of a broken mass of hills, for the most part of no great elevation, which gradually slope towards the plains of Flanders. The average height of the hills is less than 1600 feet; but in the east, they attain an elevation of about 2100 feet. Large tracts of this region consist not of hills, but of gently undulating plateaus, in some districts densely covered with oak and beech forests, but for the most part heathy, marshy, and barren. The channel of the Meuse is in some places bound in by rugged and precipitous cliffs more than 600 feet high. The principal rocks of the Ardennes are clay-slate, graywacke, quartz rock, and various metamorphic rocks; besides which occur in various places extensive outcrops of crystalline limestone. The wealth of the region is its wood and its minerals. Enormous supplies of coal are found in the north, a very important element in Belgium's industrial wealth; iron, lead, antimony, copper, and manganese are also found. Multitudes of cattle and sheep are reared. The *Arduenna Silva* of the Romans extended over a still wider area. See Montagnac, *Les Ardennes* (2 vols. Par. 1875);

Meyrac, *Les Villes et Villages des Ardennes* (1898). The 'Wild Boar of the Ardennes' was William de la Marck, Lord of Ambleve near Spa, a robber-noble of Louis XI.'s time who figures in *Quentin Durward*.—Shakespeare's Forest of Arden is a district in Warwickshire, between the Avon and Birmingham.

Ardennes, a department of France on the Belgian frontier, named from the forest, formed part of Champagne; area, 2030 sq. m. The NE. belongs to the basin of the Meuse; the SW. is watered by the Aisne. About two-fifths of the whole surface is hilly, and covered with forests and wide tracts of pasturage. In the north, marble is obtained; but the prevailing rock is limestone. South of this, and stretching across the department from east to west, are great layers of slate. Only the valleys are fertile, and produce corn. The vine is cultivated in the SW. Cattle and sheep are reared. Slate, marble, iron, clay, copper, and coal are found. Iron-working is largely carried on, and woollen cloth is woven, especially in Sedan. There are also manufactures of clay-pipes, glass, paper, sugar, and beer. The capital is Mézières. The largest towns are Charleville and Sedan. Pop. (1886) 332,759; (1911) 318,896; (1921) 277,811.

Arditi, LUIGI (1822-1903), musician and composer, born in Piedmont, studied music at the Conservatoire of Milan. Famous first as a violinist, then as a conductor, he came to London in 1857, and from that year till 1873 was musical director at Her Majesty's Theatre. He conducted Italian opera and concerts in places as remote from one another as New York and Constantinople; published the operas *I Briganti* (1841) and *La Spia* (1856); and is known as author of much popular music—songs, violin duets, and waltzes such as *Il Bacio*. His Reminiscences were edited by Baroness von Zedlitz (1896).

Ardnamur'chan Point, a rugged headland of Argyllshire, the most westerly point of the mainland of Britain. A castle-like lighthouse was built here in 1849.

Ardoch, a place in Perthshire, 12 miles NNE. of Stirling, celebrated for a Roman camp, the most entire in Britain. The intrenched works form a rectangle 500 by 430 feet, the four sides facing the cardinal points. The north and east sides are protected by five deep ditches and six ramparts, these works being 270 feet broad on the north side, and 180 feet on the east. A deep morass exists on the SE., and the perpendicular banks of Knaik Water, rising 50 feet high, protect the camp on the west. The prætorium, or general's quarters, now called Chapel Hill, rises above the level of the camp, but is not exactly in the centre, and is nearly a square of 60 feet each side. Three of the four gates usual in Roman camps are still seen. A subterranean passage is said to have formerly extended from the prætorium under the bed of the Knaik. Not far north of this station, on the way to Crieff, may be traced three temporary Roman camps of different sizes. Portions of the ramparts of these camps still exist.

Ardoye, a town of Belgium, in the province of West Flanders, 17 miles S. of Bruges. It has extensive cloth-weaving works. Pop. 7000.

Ardros'san, a seaport and watering-place in Argyshire, 1 mile WNW. of Saltcoats, and 32 miles SW. of Glasgow by rail. It owes its rise to Hugh, Earl of Eglinton, who began the formation of the present town and harbour in 1806, and who planned magnificent works, and spent vast sums in striving to make this the port of Glasgow. Suspended in 1815, these works were resumed in 1833, and now the harbour, which is sheltered by an islet, is one

of the safest and most accessible on the west coast of Scotland. A new dock was made in 1887-92. The chief exports are coal and pig-iron; the chief imports, timber, grain, limestone, and iron ore. On a hill above the town stands a fragment of Ardrossan Castle, said to have been surprised by Wallace, who slew its English garrison, and threw the dead bodies into a dungeon called 'Wallace's Larder.' Pop. 7000.

Are (Lat. *area*), the unit of the French land-measure, is a square, the side of which is 10 metres (or 32·809 feet) long (see *METRE*), and which therefore contains 100 square metres = 119·6 English square yards. The next denomination in the ascending scale is the *decare*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares, = 2·47 English statute or imperial acres.

Area (Lat.) is a term in mathematics meaning *quantity of surface*. The calculation of areas, or mensuration of surfaces, is one of the objects of geometry. The measuring unit is a square inch, a square foot, &c. according to the unit of length. As a figure is thus measured by finding an equivalent for its surface in *squares*, the process is sometimes called the *quadrature* of the figure. See *QUADRATURE*, *MENSURATION*, *SURVEYING*.

Areca, a genus of palm, containing several species, having pinnate leaves and double spathes. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *A. catechu*, the Penang Palm, or Betel-nut Palm, is a native of the East Indies, whose nut yields a sort of Catechu (q.v.). This Areca-nut, or Betel-nut, is very much used in many parts of the East, the chewing of it with quicklime and the leaf of the betel-pepper being one of the most prevalent habits of the people (see *BETEL*). The nut is about the size of a hen's egg; the fibrous husk about half an inch thick. It is austere and astringent. It is doubtful if it possesses a narcotic power, or if this is to be ascribed entirely to the leaf which is used along with it. Areca-nuts form an article of trade in the East, are imported for tooth-powder and for dog-medicine (see the article *WORMS*). The timber of the palm which produces them, and its leaf-stalks and spathes, are also used for domestic purposes. The tree is often 40 or 50 feet high, and in general less than a foot in diameter. The leaves are few, but very large, their leaflets more than a yard long. In Malabar, an inebriating lozenge is prepared from the sap.—*A. oleracea*, the Cabbage Palm of the West Indies, is a very tall tree, 100 to 200 feet, whose huge terminal leaf-bud is sweet and nutritious, and is sometimes used for the table as cabbage, but when it is cut off, the tree is destroyed. The stem of this tree, notwithstanding its great height, is remarkably slender.—*A. sapida*, the New Zealand Palm, is remarkable as extending southward beyond the geographical limits of any other of its order, as far indeed as 38° 22' S. lat. It is a small palm, only from 6 to 10 feet high, with leaves 4 to 6 feet long. The young inflorescence is eaten.

Arecibo, a town on the north coast of the West Indian island of Porto Rico, 30 miles by rail W. of San Juan; pop. 10,000.

Arena, a part of an amphitheatre where the combats of gladiators and wild beasts took place. It was so called because it was usually strewn with sand (Lat. *arena*).

Arenaceous Rocks. All rocks composed entirely, or to a large extent, of grains of quartz are included under this title. Beds of loose sand occur extensively in the more recent deposits. The grains, either of quartz or flint, are generally

water-worn and rounded; in some cases, however, they are more or less angular, or rounded and angular grains occur commingled. In older deposits, the grains of sand are bound together by siliceous, calcareous, argillaceous, or ferruginous cements. It is seldom that a rock is composed of quartzose materials alone; grains or particles of other mineral substances are frequently mingled with the grains of quartz. Silvery flakes of mica are seldom absent; and they often occur in layers parallel to the planes of stratification, causing the rock to split into thin slabs, and exposing a glittering surface. These are called *micaceous sandstones*. When grains of feldspar occur, it is a *feldspathic sandstone*. Often large quantities of calcareous matter, either as cement or as distinct grains, occur; and these are called *calcareous sandstones*. In like manner we have *siliceous* and *ferruginous sandstones*, when silica and oxide of iron are conspicuously present as cementing or binding materials. Clay and carbonaceous matter, when plentifully diffused through the rock, give rise to *argillaceous*, *carbonaceous*, and *bituminous sandstones*. *Greensand*, or *glauconitic sandstone*, is a rock containing abundant grains of the dirty greenish mineral called glauconite. *Arkose* is a sandstone composed of disintegrated granite; *volcanic sandstone*, *trappean sandstone*, &c. being composed of disintegrated igneous rocks. The presence of lime can always be detected by the effervescence which takes place on the application of hydrochloric or other acid. A sandstone of homogeneous composition, which may be worked freely in any direction, is called *freestone* or *liver-rock*. *Flagstone* is a sandstone which is capable of being split into thin beds or flags along the planes of deposition. When the sandstone is coarse-grained, it is usually called *grit*. If it contain, more or less abundantly, grains large enough to be called pebbles, the sandstone is said to be *conglomeratic*; and if the pebbles or stones be angular, the rock is described as a *brecciated sandstone*. Coarse-grained *grits* and *pebbly* or *conglomeratic sandstones* pass into *conglomerate* or *puddingstone*, which consists of a mass of various-sized water-worn stones. *Brecciated sandstones* frequently pass into *breccia*, which is an aggregate of angular and subangular fragments. *Graywacke* is a dark-gray or grayish-blue sandstone, more or less altered or metamorphosed, met with among Palæozoic formations.

Arenaria. See SANDWORT.

Arenberg (*Aremberg*), from 1644 till 1820 a small sovereign duchy of Germany, lying between Jülich and Cologne; now part of the district of Coblenz, Rheinland.

Arendal, a coast-town in the south-east of Norway, situated near the mouth of the Nidelf in the bay of Christiania. It is built partly on piles, partly on rock, and has been called 'Little Venice,' on account both of its picturesque appearance and of the canals which intersect it. The bay, which is protected by the island of Tromø, forms an excellent harbour, and favours the commerce of the town, which includes large exports of iron and timber. Pop. 10,000.

Arends, LEOPOLD, founder of a widely popular system of stenography, was born at Rakishy, near Wilna, 1st December 1817. Educated at Dorpat, in 1844 he settled in Berlin, where he died 22d December 1882. He wrote dramas, as well as books on popular natural history and ancient Hebrew music, but his name is best known through his 'rational stenography,' first published fully in 1860 in his *Vollständige Leitfaden*. His is the youngest of the three great rival systems in Germany—the others being those of Gabelsberger and Stolze—but

it is perhaps the most widely used, and it has been introduced into the Spanish, French, Hungarian, and Swedish languages. See WENDTLAND, *Leopold Arends und seine Schule* (Leip. 1883).

Arenicola. See SANDWORM.

Areometer, an instrument for determining specific gravity, called also the Hydrometer (q.v.).

Areop'agus, a small hill in Athens, and a court which met there. See ATHENS; also DIONYSIUS THE AREOPAGITE, MILTON.

Arequí'pa, a term applied primarily to a mountain in the west Cordillera of the Peruvian Andes, as also to a city at its foot, and to the southern department of Peru, which contains them both. The mountain, also called Misti, is volcanic, of the form of a truncated cone; it sometimes smokes, and has a height of 19,000 feet. Its neighbourhood is subject to earthquakes. The city, in a rich valley, 7700 feet above the sea, is the third largest in Peru, being inferior only to Lima and Callao, and contains about 35,000 inhabitants. It carries on a considerable trade in llama wool, gold, &c. with the interior and by sea. Harvard University has an observatory near by. A remarkable railway runs *via* Arequipa from the port of Mollendo across the Andes to Lake Titicaca, Cuzco, and Bolivia. This neighbourhood is fruitful and well cultivated. The department adjoins Moquegua, the most southerly region of Peru. It has an area of 22,000 sq. m., and a population of 229,000. As in nearly the whole of the maritime region of Peru, the soil is generally arid. Boiax, copper, and other minerals are worked.

A'rés, the Greek god of war, or more particularly of its horror and tumult, was the son of Zeus and Hera, and one of the favourites of Aphrodite. He is represented in Greek poetry as a most sanguinary divinity, delighting in war for its own sake, and in the destruction of men. Before him into battle goes his sister *Eris* ('Strife'); along with him are his sons and companions, *Deimos* ('Horror') and *Phobos* ('Fear'). He does not always adhere to the same side, like the great *Athena*, but inspires now the one, now the other. Nor is he always victorious. Diomed, by the help of Athena, wounds him, and in his fall, says Homer, 'he roared like nine or ten thousand warriors together.' It is certain he was not originally a god of war, but it is disputed whether he was originally a storm-god, a god of the sky, sun, or light. Probably he was originally a chthonic deity, and as such brought pestilence and destruction. The worship of Ares was imported from Thrace. There Ares was believed to have his chief home. He had, however, temples or shrines at Athens, Sparta, Olympia, and other places. On statues and reliefs he is represented as young and of great muscular power, either naked or clothed with the chlamys. The Romans identified their national war-god Mars with the Greek Ares. See MARS.

Areteus, a Greek physician of Cappadocia, who flourished about 100 A.D. He is considered to rank next to Hippocrates in the skill with which he treated diseases; was eclectic in his method; and in the diagnosis of disease is superior to most of the ancient physicians. The first four books of his great work, preserved nearly complete, treat of the causes and symptoms of diseases; the other four, of the cure of the same. There are editions by Wigan (1823) and Adams (Greek and English, 1856), and a translation by Reynolds (1837).

Arethusa. See ALPHEUS.

Aretin'ian Syllables are the syllables *ut, re, mi, fa, sol, la*, used by Guido of Arezzo for the names of the notes in his musical scale. See GUIDO, SOLFEGGIO.

Aretino, PIETRO, an Italian poet of the 16th century, was the natural son of a nobleman named Luigi Bacci, and was born at Arezzo, in Tuscany, in 1492. Banished from his native town, he went to Perugia, where he wrought as a bookbinder, and afterwards wandered through Italy in the service of various noblemen. At Rome, he distinguished himself by his wit, impudence, and talents, and secured even the papal patronage, which, however, he subsequently lost by writing his sixteen shameless *Sonetti Lussuriosi*. He now went to the Medicean court, where John de' Medici grew fond of him, and even procured him an opportunity of ingratiating himself with Francis I. at Milan in 1524. A few years later, he settled at Venice, where he also acquired powerful friends. The Bishop of Vicenza not only soothed the irritation of the pope against Aretino, but also recommended him to the Emperor Charles V. The latter, as well as his chivalrous rival, Francis, and other great persons, pensioned the fortunate wit, besides enriching him with splendid presents. It is said that while laughing heartily at a droll adventure of one of his sisters, he fell from a stool, and was killed on the spot (1537). His poetical works include five witty comedies and a tragedy of some merit. His satire procured for him the name of 'the Scourge of Princes;' but it seems clear that he was equally well fitted to be their sycophant. Although the very impersonation of licentiousness, he had nevertheless the impudence to publish some books of a devotional kind, with the view of obtaining the favour of the pope. Aretino's letters, and those written to him by various eminent men, contain much interesting information regarding his life and times. Nothing in the history of Italian literature is more extraordinary than that this coarse, dissolute, and comparatively ignorant man should have been praised, courted, and almost worshipped as he was. See the Lives of him by Chasles (Par. 1873), Sinigaglia (Naples, 1882), Bertani (1902), and Edward Hutton (1922).

Arezzo (anc. *Arretium*), the chief city of an Italian province, is situated in a fertile valley near the confluence of the Chiana with the Arno, 38 miles ESE. of Florence. Arezzo was one of the twelve cities of the ancient Etruscans, and was famous for its pottery. It was devastated by Sulla during the Social war; was sacked by the Goths; and during the contest of the Guelphs and Ghibellines, fought stoutly for the latter, but ultimately became subject to Florence. The Piazza Grande, built by Vasari, is remarkable; the church Santa Maria della Pieve is founded on the site of a heathen temple. The Gothic cathedral (begun 1277) has a splendid high altar in marble by Giovanni Pisano; and the several churches contain fine specimens of the Tuscan school of painting. The city produces silk, and manufactures cloth, combs, and pottery; and it has a museum, library, and academy of sciences. Perhaps no city of its size has produced a greater number of celebrated men, among whom may be mentioned Petrarch; the poet Aretino; Spinello Aretino; Leonardo Bruni; Guido of Arezzo (probably); Ciesalpino, the botanist; Pope Julius III.; and Vasari. Pop. (1901) 44,350; (1911) 47,500.

Argala. See ADJUTANT.

Argali (*Ovis argali*; also *Ovis ammon*), the great wild sheep of Siberia and Central Asia. It is found from Kamchatka to the Himalaya Mountains, where, however, it is only seen in the more elevated regions. 'We came suddenly,' says Dr Hooker in his *Himalayan Journal*, 'upon a flock of gigantic wild sheep, feeding on scanty tufts of dried sedge and grass; there were twenty-five of these enormous animals, of whose dimensions the term

sheep gives no idea; they are very long-legged, stand as high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when detached and bleaching on the barren mountains of Tibet.' The horns of the male, which he uses for fighting, are nearly 4 feet long, and 14 inches in circumference at the base, where they are triangular. The general colour is dark gray, paler beneath, with a whitish disk around the tail. The wool is concealed by hair. The tail is a mere stump, an inch or so long. They are very keen-sighted, quick of hearing, and

Argali Sheep.

with a delicate sense of smell; they keep persistently to one place, and are little disturbed by the natives. They have great powers of leaping, even from heights of 20 or 30 feet. A similar but smaller form is also found on the Himalaya Mountains. The White-breasted Argali (*Ovis poli*) is another closely allied form inhabiting Northern Tibet. The Rocky Mountain sheep, or Big-horn (*Ovis montana*), which is sometimes called the American Argali, has very similar characters. See SHEEP; and for details as to Argali, Prejevalsky's *Mongolia* (1876).

Argan (*Argania sideroxylon*, *Sideroxylon spinosum* of Linnaeus), a low spiny evergreen tree of the natural order Sapotaceæ, a native of Southern Morocco, bearing an ovate drupe about the size of a plum, dotted with white, and with white milky juice. The Moors extract an oil from the fruit, which they use with their food.

Argand, AIMÉ, physician and chemist, was born at Geneva in 1755. He was the inventor of the well-known *Argand lamp*. In the ordinary oil-lamp, combustion was not complete. Argand's improvement was that he made the wick in the form of a ring. The flame thus became a hollow cylinder with a current of air ascending through the inside, so that the burning surface was doubled. It would appear, however, that the lamp did not satisfy the expectations of Argand, till his younger brother accidentally discovered the effect of a glass cylinder, as a chimney over the flame, by which the flame was steadied, a draught created, and the greatest possible amount of light yielded. Argand was soon involved in a dispute with Langé as to the originality of his invention, but ultimately they shared the honour.

Argand Gas-burner.

The same principle is employed in the Argand gas-burner. Gas is admitted by means of a side tube (A in the fig.) into the space between two concentric cylinders. The space is closed at the bottom, but the gas escapes at the top through a series of small openings. The air has free access to the outside of the flame, and also to the inside, since the internal cylinder is open above and below. Argand, who lived for a time in England, died in 1803.

Argania. See SAPOTACEÆ.

Argaon, a village in the Akola district of Berar, India, near which, in 1803, Wellesley defeated the Mahrattas (see WELLINGTON).

Argelander, FRIEDRICH WILHELM AUGUST (1799-1875), born at Memel. As chief of the observatory of Åbo, in Finland, he commenced observations, continued at Helsingfors, where he published a catalogue of 560 stars having 'proper motions.' A professor at Bonn, he published his *Uranometria Nova* (1837) and an *Atlas of the Northern Heavens* (1863). He studied the changes of light in variable stars, and proved a progressive motion of the solar system in space.

Argensola, LUPERGIO and BARTOLOMEO DE, the 'Spanish Horaces,' born in 1564 and 1565, were in succession historiographers of Aragon. The elder brother died in 1613, the younger in 1631.

Argentan, a Norman town in Orne, 42 miles SSE. of Caen, with a pop. of 7000.

Argentina, or the ARGENTINE REPUBLIC, is the second in size and by far the most prosperous of the republics of South America. The form of government is federal, the republic consisting of 14 provinces, 10 territories, and 1 federal district. It is bounded on the north by Bolivia; on the east by Paraguay, southern Brazil, Uruguay, and the Atlantic Ocean; on the south by the Antarctic Ocean; and on the west by Chile (with the Cordillera de los Andes as frontier). Of the island of Tierra del Fuego, the eastern portion belongs to Argentina; Chile owns both shores of Magellan Strait. Argentina claims the Falkland Islands (q.v.).

The national capital, the city of Buenos Aires (q.v.), is a federal district (72 square miles). The provinces (with areas in square miles) are: Buenos Aires (117,777 sq. m.), Santa Fé (50,713), Entre Rios (29,241), Corrientes (33,535), La Rioja (37,839), Catamarca (36,800), San Juan (37,865), Mendoza (56,502), Córdoba (66,912), San Luis (29,035), Santiago del Estero (55,385), Tucumán (10,422), Salta (43,302), Jujuy (14,802). The territories are: Misiones (11,511), Formosa (41,402), Chaco (52,741), Pampa (56,320), Rio Negro (79,805), Neuquen (40,530), Chubut (93,427), Santa Cruz (109,142), Tierra del Fuego (8299), Los Andes (34,740). The total area exceeds 1,153,000 sq. m.

The population of the Argentine Republic in 1869 was 1,830,214; in 1895 it was 3,954,911; at the census of 1914 it was 7,885,237; by 1921, by official calculations, it was 8,698,516. This includes some 30,000 pure Indians. The Argentine nation contains roughly four parts European (chiefly Spanish and Italian) stock to one part Indian. In 1895 three-fourths of the inhabitants were Argentine-born. For so vast a country the growth of population is slow. From 1908 to 1912 births exceeded deaths by about 140,000 per annum; immigrants outnumbered emigrants by about 160,000 per annum. Of 4,250,000 immigrants landed in 1857-1912, nearly 50 per cent. were Italians, 30 per cent. Spaniards. Of late years Spanish arrivals have exceeded Italian. Buenos Aires city (1,700,000) and province (2,300,000) account for almost half the entire population. Tucumán has about 32 inhabitants to the square

mile; Córdoba, Corrientes, Entre Rios, Santa Fé from 10 to 20; the other provinces and Misiones and La Pampa from 2 to 5; the other territories about 1 person to every 2 square miles.

Physical Features.—The country may be divided into four regions: firstly, Patagonia, which stretches from the Rio Colorado to Cape Horn; secondly, the Andine region, which runs from the southern frontier of Bolivia right along the Chilean border; thirdly, the Gran Chaco, which embraces the whole of the north of Argentina except the Andine strip; fourthly, the Pampa, which comprises the central and best-known region. The section between the Uruguay and the Paraná (Entre Rios, Corrientes, Misiones) forms 'Mesopotamia.' Patagonia has been called the Great Shingle Desert. In the Andine region the towering Cordillera attains its chief heights. In the province of Mendoza are to be found Aconcagua (23,392 feet), Tupungato, and several other peaks of some 20,000 feet. Owing to want of moisture the mountains are bare and the scenery is less imposing than in other parts of South America. Among offshoots of the Andes are the sierras of Humahuaca (Jujuy), Aconquija (Tucuman and Catamarca), and Famatina (La Rioja). The Gran Chaco is a rough denomination for the subtropical north, where rice and the sugar-cane are cultivated; but its development has hardly been begun, and a large part is covered with dense forests, ranged by savage Indians. Córdoba has mountain-ranges in the north and west. The real Argentina is the Pampa, the middle tract, consisting of grassy plains and rich corn-lands, and including very little waste land, for the vast plain is broken only by two small mountain-ranges, the Tandil and the Ventana. Geologically it once formed part of the great Pampean Sea, and now consists of the Pampean mud, which contains an extraordinary number of mammiferous remains. The northern portion contains many *salinas* (salt lakes and deserts). The Pampa region now has practically all the political and industrial significance which belongs to Argentina; the other parts possess natural wealth, and may have a great future, but as yet they are only the raw material of a state. The climate of Argentina varies greatly, as is natural in a country extending over 2300 miles north and south (from 22° to 55° 30' S.). The seasons are the reverse of those in Europe. The north is hot, while in the south and on the Andes the cold is severe. In Buenos Aires is found a characteristic climate of mild winters and moderately hot summers, and this extends over the whole province of that name, and also over Santa Fé, San Luis, Mendoza, parts of Córdoba, and parts of one or two adjacent provinces. The climate of Buenos Aires (city and province) is fresher than that of the other provinces. Its worst feature is the north wind, which is considered extremely unhealthy; while the *pamperos*—the strong winds from the south-west—blow with terrific force, and cause great variation in temperature. The rainfall of Buenos Aires (city) averages nearly 34 inches. San Juan has about 4, Corrientes 59, Ushuaia (Fuego) 120 inches per annum. The littoral districts have most rain, the Andine regions very little. The coast is low and sandy to the north; higher, with frequent cliffs and bluffs, to the south. Argentina is on the whole well watered. The chief rivers (valuable for irrigation or navigation purposes) are the Paraná and Uruguay, entering the river Plate (see LA PLATA); the Colorado, Negro, Chubut, Desado, Santa Cruz, and Gallegos, in the south. The largest lakes are Mar Chiquita (a salt lake in Córdoba), Nahuel Huapi, (Rio Negro), Buenos Aires, San Martín, Viedma, and Argentino (Santa Cruz).

Among native animals of the plains are the wild llama (see HUANACO), the fox, skunk, and various species of deer and ant-eaters. In the Chaco the fauna exhibits greatest variety. Here is to be found, though rarely, the jaguar, most ferocious of South American beasts, and very destructive both to men and cattle. The puma also takes its toll from domestic animals, but is said to be harmless to man. The tapir is not savage. Snakes are fairly numerous, but few are dangerous. In the great rivers the alligator is common, and the fish are good and plentiful. Insects abound.

Products.—As an exporter of grain and meat, of agricultural and pastoral products, the republic is celebrated all over the world. By 1895 only 12,230,000 acres had been brought under cultivation. By 1920—thanks to railways, foreign capital, immigration, and other stimuli—the total was raised to 62,500,000; and the productive land awaiting development was estimated at four or five times that figure. Drought is being counteracted by irrigation works, big and little; but no effective means has yet been found of ridding the land of the locusts which swarm in myriads from the hot northern deserts, devouring all vegetation. The most important, although not the oldest, industry is wheat-growing. The wheat area sprang from 271,000 acres in 1874 to 1,717,000 in 1884; and in the next thirty years the area multiplied tenfold. It is maintained that 70,000,000 or 80,000,000 acres could at once be brought under the plough for wheat were the labouring hands available. The chief wheat areas are Buenos Aires, Santa Fé, Córdoba, and Pampa. In 1918–19 over 5,000,000 tons of wheat were produced, and nearly 3,000,000 tons exported. The milling industry correspondingly grows apace, supplying ever-increasing home demands, and exporting flour (to Brazil), bran, and pollards (to Europe). Maize has likewise made enormous progress, especially in Buenos Aires, Santa Fé, and Córdoba. In 1900–12 the area sown rose from 2,500,000 to 9,500,000 acres, the production from 1,500,000 to 7,500,000 tons, the exports from 700,000 to 4,800,000 tons. In the same provinces and in Entre Ríos linseed (flax) is grown extensively. The area in 1918–19 (3,500,000 acres) was four times the total for 1897. Argentina is the largest linseed-producer in the world. Oats, which occupied only 55,000 acres in 1899, covered 3,000,000 acres (mostly in Buenos Aires) in 1918, with a production and export of about 1,000,000 tons. The value of alfalfa to the stock-raiser and as an article of export has been so much appreciated since its introduction that the area sown spread from 264,000 acres in 1872 to 15,000,000 in 1912. It yields several crops per annum, and in addition fertilises the soil. Sugar has for 200 years been cultivated in Tucumán. There are also promising plantations in Jujuy and Chaco. The wine industry is centred in Mendoza and San Juan. In 1911 250,000 acres of vineyard yielded 85,300,000 gallons of wine. In 1918 over 100,000,000 gallons were produced. Minor products which may yet attain importance include *yerba maté*, or Paraguayan tea (in Corrientes and Misiones), tobacco, cotton, rice, rubber, and ground-nuts. Since 1903 agricultural products have sometimes ousted live-stock products in Argentine export tables:

Exports.	1903.	1913.	1917.
Live-stock.....	£21,836,000	£32,000,000	£75,200,000
Agricultural...	21,050,000	53,145,000	28,900,000

In the forests of Santiago del Estero and the northern subtropical region quebracho is the chief wood worked. Over £3,500,000 of forest produce was exported in 1917.

For stock-raising Argentina has always been renowned since the Spaniards introduced sheep and cattle at the beginning of the sixteenth century.

The number of animals in the republic was in 1920 (Stock Census): cattle, 27,392,126; sheep, 45,303,419; horses, 9,366,455; goats, 4,670,130; pigs, 3,227,346; mules, 565,069; donkeys, 260,157. The cattle industry has made enormous strides of late years. In quite recent times animals were killed for their hides and the carcasses left to rot on the ground; but now the export of beef is on a large scale, and the prosperity of the industry is due to the far-sighted enterprise of the estancieros (owners of ranches), who sedulously import the best blood-stock. Enormous exports, heavy home consumption of meat, excessive slaughter of cows, droughts, disease, and the encroachments of agriculture on pasture-lands in Buenos Aires and other cereal regions have prevented the herds from increasing since 1908. Sheep-farming, after a period of retrogression—the number of sheep was reckoned at 100,000,000 in 1895—is now again going ahead, thanks to the opening up of Patagonia, which, out of an estimated total of 80,400,000 sheep in 1912, claimed 22,000,000, as against 11,000,000 in 1908. In 1912 1,500,000 carcasses of frozen and chilled beef and 3,000,000 of mutton and lamb were shipped abroad—nearly all to Britain. In addition, 6,000,000 ox-hides were exported (mostly to Germany and the United States), about 170,000 tons of wool, besides sheepskins, tallow and grease, preserved and salted beef and tongues, extract of meat, bones, and other sub-products. The breed of horses has been greatly improved by a liberal importation of blood-stock. The mineral resources of the country (mostly located in remote unpopulated districts) are comparatively undeveloped. In the sub-Andean regions, chiefly to the north-west, gold, copper, lead, tin, and silver are found. The Famatina Mine in La Rioja yields copper and gold. Salt, iron, alum, lime, marble, cement, and coal are among the minerals of the country. A considerable amount of gold-dust is found in the sand of the seashore and river-beds of Patagonia. Los Andes contains borax deposits. Oilfields at Comodoro Rivadavia (Chubut) are being exploited by government.

Manufactures, though encouraged by assiduous protection, are altogether insufficient to supply domestic needs. Foreign trade is vital to Argentina, for it relies upon the sale of its agricultural and pastoral products to pay not only for the imports, but also for the capital (mostly British) lent to foster the country's industries. An industrial census in 1914 showed that in 35,093 factories 383,706 persons were employed, as against 219,548 in 24,124 factories in 1895. Wine and sugar account for 25 per cent. of the employees. In 1913 the imports, consisting of coal and all manner of manufactures, were valued at £84,270,000. Great Britain has long maintained the first place in this trade, and her share in that year amounted to 30 per cent., the principal items being coal, textiles, and railway materials. Germany claimed 17, the United States 15, per cent. For the same year the exports of Argentina amounted to £96,700,000, and of these Great Britain took the largest amount, viz. 25 per cent. The principal seaport, Buenos Aires, handles four-fifths of the imports and half the exports. The Paraná provides a magnificent waterway, and on it stands Rosario, the second port and second city of the republic. La Plata, the capital, and Bahía Blanca, in the south, are the chief ports in Buenos Aires province. Corrientes, Santa Fé, Paraná, Villa Constitución, San Nicolás, Ibicuy, Zarate, and Campana, on or near the Paraná; Monte Caseros, Concordia, Colon, Concepcion del Uruguay, and Gualeguaychú, in the Uruguay basin, are active river-ports. Other important towns are Córdoba, Tucumán, and Mendoza. A network of railways covers the east central

region. The principal broad-gauge (5 feet 6 inches) lines were built by British capital—the B.A. Great Southern, B.A. and Pacific, Central Argentine, B.A. Western; as also the Córdoba Central Railway (metre gauge). In Santa Fé are French lines. State lines are opening up the remote north and Patagonia. The B.A. and Pacific (completed 1910) climbs and pierces the Andes (summit 10,500 feet), linking the Atlantic and Pacific by rail (888 miles). Other transcontinental lines are projected, and will connect Buenos Aires and Antofagasta *via* Salta, Buenos Aires and Caldera through Catamarca, Bahía Blanca and Concepcion across Neuquen, San Antonio (Rio Negro) and Valdivia *via* Lake Nahuel Huapi. By train and train-ferry Buenos Aires has transit to Uruguay, Brazil, and Paraguay; and the Government Central Northern runs to La Quiaca, there to be linked up with the Bolivian system. In Patagonia lines strike inland from Port Madryn (a Welsh colony) and Comodoro Rivadavia in Chubut, and Port Deseado (Santa Cruz). British capital invested in Argentina has been estimated (1913) at £500,000,000, including nearly £200,000,000 in railways. The total railway mileage exceeds 20,000 (as against 10,000 in 1900), state lines representing about one-sixth. River navigation is being improved and extended. Important irrigation schemes are being carried out, especially on the upper Rio Negro in Neuquen.

Government.—The constitution is based on that of the United States of America. The federal republic has a president (with wide powers), vice-president, eight secretaries of state, a Senate (representing the provinces), and a House of Deputies (representing the nation). The provinces elect governors and legislatures of their own to manage purely local affairs. The national territories are under governors and a director-general. Spanish is the language and Roman Catholicism the religion of Argentina, but there is no state religion, and all creeds are tolerated. There are, for instance, several Jewish colonies. Primary education (mostly under provincial control) is free, secular, and nominally compulsory (from six to fourteen); but illiteracy is still very prevalent among children and adults. Secondary education is under federal management. There are national universities at Córdoba, Buenos Aires, La Plata, and Rosario; provincial universities at Santa Fé, Tucumán, and (for Mendoza, San Luis, and San Juan) at Cuyo. All males born in Argentina are liable to military service from the age of twenty to forty-five. The standing army and the navy are recruited by conscription. The army's peace strength is between 20,000 and 30,000, its war strength ten times as great. The navy has been renovated since 1910, when orders were placed for two Dreadnoughts and twelve destroyers. There are, in addition, several ironclads, armoured and protected cruisers, and smaller vessels, mostly obsolete. The naval bases are Puerto Belgrano and La Plata. The main sources of revenue are import and export duties and taxes on tobacco and alcohol.

History.—Very little is known of Argentina before the advent of the Spaniards. The hardiest natives were the Araucanians, a branch of the Ando-Peruvian race. The Pampean race belongs to a lower grade, and includes the Patagonians and Puelches of the south, and many northern tribes such as the Charruas. The distinct Brasilio-Guaranians include the rude tribes who were civilised by the Jesuits. All were in a very low state of civilisation. The search for a westward sea-route to the Moluccas led to the discovery of the Argentine and of the Magellan Strait (1520). In 1516 the Spaniard Juan Diaz de Solis sailed up the river Plate, but was slain by the savages as soon as he

landed; and an expedition of Cabot some ten years later made no serious attempt at a settlement. In 1535 Pedro de Mendoza arrived with a large force and founded the city of Buenos Aires. Incredible difficulties were encountered both from scarcity of food and the hostility of the Indians, and the city was twice abandoned. But the Spaniards were more successful at Asuncion, now the capital of Paraguay, and in 1573 the brave Juan de Garay, advancing southward from that city, founded Santa Fé, and in 1580 was strong enough to refound Buenos Aires, which soon became a flourishing place. The Spanish system of colonial government was neither energetic nor efficient, but English writers have exaggerated its defects. The cruelties of the settlers were tempered by Jesuits (till their expulsion, 1767) and crown officials, and the easy-going paternal rule of the Spanish king was not unsuited to the indolent yet adventurous Indo-Spanish race which sprang up on the banks of the river Plate. In 1620, on the advice of Hernanderias de Saavedra, the enlightened governor of La Plata (a captaincy-general including modern Paraguay and Uruguay), Buenos Aires, with territory forming the nucleus of modern Argentina, was made into a separate province under a governor. The 17th century was largely occupied with Indian wars, the first three-quarters of the 18th with struggles against the English, who assailed the Spanish monopoly, and with aggressions from the Portuguese in Brazil. In 1776 Buenos Aires became capital of the new viceroyalty of La Plata, embracing Argentina, Bolivia, Paraguay, and Uruguay, and at last entitled to trade direct with Spain, instead of only *via* Lima, in the viceroyalty of Peru, as in the past. The colonists now became aware of the weakness of Spain, and, led by Liniers, learned their own strength in frustrating the British attack in 1806 under Beresford and that under Whitelocke in 1808. Whitelocke had a large army and fleet, but owing to incapacity was obliged to capitulate in Buenos Aires after heavy loss. As Spain was distracted by the Napoleonic war, the colonists founded a local provisional government in 1810. A sanguinary war for independence ensued, in which Generals Belgrano, San Martin, and Alvear, and Almirante Brown, especially distinguished themselves. In 1823 Britain recognised the United Provinces of Rio de la Plata. Much civil discord followed, and from 1829 to 1851 the republic endured the tyranny of Rosas. In 1853 the federal constitution was granted, Buenos Aires, however, remaining outside the confederation. Struggles between the Porteños (of Buenos Aires) and the Provincials, between Unionists and Federalists, continued to hamper progress; but the Brazilian-Argentine war against Paraguay (1865-70) was a still more serious obstacle. In the 'seventies material prosperity began to revive, and in 1878 General Roca greatly enlarged the boundaries of the republic by reducing Patagonia. In 1880 Roca proclaimed Buenos Aires federal capital and established a strong central government, while retaining the federal constitution. During the 'eighties trade increased by leaps and bounds, and capital poured into the country; but overestimation of its resources led to frantic speculation, and government, provinces, municipalities, and individuals indulged in wasteful expenditure. A revolution broke out in 1890, and though a serious attempt was made to reform abuses, the inevitable financial crash came in 1891, and a period of depression ensued. Recovery was promoted by the wise measures of General Roca, during whose presidentship (1898-1904) a dangerous boundary dispute with Chile was settled (1902) by the arbitration of King Edward VII. Since that time Argentina has led the way in South America along the path of peaceful development.

The naval programme of Brazil, which has led the Argentine government to reply by building battle-ships, has been a disturbing element, and in 1909 there was trouble with Bolivia over a boundary dispute; but recent years have shown increasing political and industrial stability. In 1910 the centenary of Argentine independence (May 25th) was celebrated with great rejoicing.

See ANDES, BUENOS AIRES, LA PLATA, PATAGONIA, and South America under AMERICA; *The Argentine Year Book* (annual); Hudson, *Naturalist in La Plata* (1903), and other books; Koebel, *Modern Argentina* (1907) and *Argentina, Past and Present* (1910); Hirst, *Argentina* (1910); Martínez and Lewandowski, *The Argentine in the Twentieth Century* (trans. 1911); Pennington, *The Argentine Republic* (1911); Kilik's *Argentine Manual* (annual); consular reports; and official publications in Buenos Aires by Pillado. For history, see Funes, *Ensayo* (1816-17), and Akers, *A History of South America* (1904).

Argentine (*Argentina*), a small smelt with silvery scales, abundant in the Mediterranean.

Arges, a genus of small bony fishes belonging to the family Loricariidae, allied to the Silurids. They are found at great altitudes (up to 10,000 feet) in the volcanic regions of the Andes, and according to Humboldt's account (1805) they are ejected along with torrents of hot muddy water from the craters and sides of the volcanoes. In reality they are carried down during volcanic disturbances, not from the volcanoes, but from the mountain torrents, and huge numbers may be spread out on the flooded ground far below.

Argol is a crude variety of cream of tartar which forms a crust in the interior of wine-vats and wine-bottles, and is used for the preparation of Cream of Tartar (q.v.) and Tartaric Acid (q.v.).

Argolis. See ARGOS.

Argon. The discovery of a new gaseous constituent of the atmosphere, to which the name argon was afterwards given, was first announced at the British Association at Oxford in 1894 by Lord Rayleigh and Ramsay. This gas, which forms rather less than 1 per cent. by volume of the atmosphere, appears to have been in the hands of Cavendish in 1785, but it was not recognised by him as a separate substance. In making a series of careful determinations of the density of nitrogen, Lord Rayleigh found in the course of experiments, extending over several years, that the density of nitrogen obtained from the atmosphere was uniformly greater than that of nitrogen prepared from nitrogen compounds. Hence he was led to examine atmospheric nitrogen for the presence in it of traces of a denser gas. For this purpose he employed the method of Cavendish—i.e. passing electric sparks through a mixture of air and a sufficiency of oxygen, absorbing the gases so formed by means of alkaline solutions, and then, when no further diminution of volume could be produced, removing the excess of oxygen. A small residue of argon was always obtained. Ramsay prepared argon from the air by first separating the oxygen and then removing the residual nitrogen by means of red-hot magnesium. Argon is a colourless gas which can be liquefied on being subjected to a very low temperature. It has also been solidified. It is now classed as an element, with atomic weight 39.88. It does not combine with any other element.

Intimately connected with the discovery of argon is the discovery of helium. Lockyer and Frankland gave the name helium to a supposed element detected spectroscopically in the sun's chromosphere during the eclipse of 1868 (see SUN). In March 1895 Ramsay announced the discovery by means of the spectroscope of a new gas identical with helium in the mixture of gases obtained by boiling the mineral clèveite with dilute sulphuric acid—a

mixture also obtained by heating clèveite or broggerite in an exhausted tube. At a later date Ramsay, along with Collie and Travers, found helium to be much less dense than any known gas except hydrogen. Its relative density is 2, and it also is an elementary gas, closely allied chemically to argon. The spectrum of helium is characterised by five very brilliant lines—in red, yellow, blue-green, blue, and violet. For the production of helium from radium emanation, see RADIUM.

In 1898 Ramsay and Travers discovered three more elementary gases belonging to the same family as argon and helium, and they named them neon, krypton, and xenon. All occur in minute proportions in the atmosphere, and can be obtained, by fractional separation, from crude argon.

The discovery of the helium, argon, &c group of elementary gases necessitated some modification of the periodic classification of the elements (see ATOMIC THEORY), since they did not fill any foreseen blanks in the Periodic System. They are now placed by themselves in a new group, possessing valency=0, and when so placed they fit into the general system in a sufficiently satisfactory manner.

Argonaut. See NAUTILUS.

Argonauts, heroes of Greek Mythology who, in their ship *Argo*, undertook a long voyage into unknown seas, under the command of Jason. Pelias, usurping king of Iolcus in Thessaly, to get rid of his nephew Jason, sent him to fetch the Golden Fleece from Colchis—the fleece of a sacred ram which Æetes had hung up on an oak in the grove of Ares, where it was guarded day and night by a sleepless dragon. Jason caused Argus to build a ship of fifty oars; and for this adventure gathered together the bravest heroes from all parts of Greece, fifty in number (including Hercules, Castor and Pollux, Theseus, &c.). By Lemnos, along the coast of Thrace, up the Hellespont, and over the Black Sea they sailed, with many adventures, such as passing safely between the Symplegades, two rocks near the entrance of the Black Sea that were wont to close in on and crush all ships trying to pass through. At length they arrived at the mouth of the river Phasis, in Colchis. Here King Æetes promised to give up the golden fleece to Jason, on condition that the latter should yoke to a plough two fire-breathing bulls with brazen hoofs, and should sow the dragon's teeth not already sown by Cadmus in Thebes. Jason, by the help of the famous sorceress Medea, daughter of Æetes, who had fallen passionately in love with the bold navigator, fulfilled these conditions; and was also assisted by Medea (q.v.) in still more wonderful exploits. He obtained from her, under promise of marriage, a charm against fire and steel, and was enabled to destroy all the warriors who sprang up from the land sown with the dragon's teeth. While Jason was engaged in this task, Æetes formed a plan to burn the ship *Argo* and put the crew to death. By her help he stupefied the dragon-sentinel by an opiate-charm prepared by Medea, seized the golden fleece, and, embarking in the *Argo* with his mistress, sailed away from Colchis by night. In spite of the pursuit of Æetes and of the charms of the Sirens, and of storms that drove them to Crete, Corcyra, and elsewhere, they arrived safe at Iolcus; and Jason dedicated the good ship *Argo* to Poseidon at Corinth. The story is referred to in the *Odyssey*, is related by Hesiod, and told with great fullness by Apollonius Rhodius, but the discrepancies are great. And the Greek epic is but one form of a widely diffused folk-tale, of which Lang collected variants from Samoyed, Epirot, Kaffir, Malagasy, Algonquin, Gaelic, Norse, Russian, Italian, Japanese, and Samoan sources.

See Grote's *Greece*; Lang's *Custom and Myth*, Roscher's *Lexikon der Mythologie*.—For the animal, see NAUTILUS.

Argos, reputed the oldest city in Greece, stood 3 miles from the sea in the north-east peninsula of the Peloponnesus, figures largely in the mythical ages, and was the nucleus of a kingdom of which in Homer's time Mycenæ (q.v.) was the capital. From it all the Greeks were known as Argives. After the Dorian invasion (see GREECE) Argos still remained, under the Dorians, the chief state in the Peloponnesus, but decayed from the 7th century B.C., till in 495 Sparta robbed it of supremacy and influence. It sided with Athens in the Peloponnesian war, joined the Achaean league in 243 B.C., and it and its territory, known as Argolis, became part of the Roman province of Achaia in 146. Argolis is still the name of the peninsula of the Morea, lying between the bays of Nauplia and Egina. No longer united with Corinth, it forms one of the provinces of the kingdom of Greece, with an area of 1000 sq. m., and a pop. of 82,000. In the plain of Argos was the Lernean marsh, home of the Hydra slain by Hercules. It is surrounded by mountains (summits 6000 ft.), which also gird the coast. The modern and prosperous town of Argos, the capital, is built on the site of the ancient city, 7 miles from Nauplia (q.v.), and has still remains of its cyclopean walls and its rock-hewn amphitheatre. Pop. 10,000.

Argostoli, a seaport of the Ionian Islands, capital of Cephalonia, is the seat of a Greek bishop, and has a good harbour. The 'sea-mills of Argostoli' are two holes in the rocky coast into which the sea pours with a force sufficient to drive two mills, and disappears, to return, most likely, through brackish springs. Pop. 10,000.

Argot. See SLANG.

Arguelles, AUGUSTINO, born in Asturias in 1776, gained a high reputation for patriotism and eloquence in the cortes (1812-14). Arrested at the restoration, he suffered ten years' captivity till the revolution of 1820. He was made Minister of the Interior, but on the fall of the constitution (1823) he fled to England, where he remained till the amnesty of 1832. Afterwards he was vice-president and president of the Chamber of Deputies; and died March 23, 1844.

Argus, the son of Zeus and Niobe, third king of Argos, which took from him its name.—**ARGUS**, son of Agenor, or of Inachus, surnamed Panoptes ('all-seeing'), had one hundred eyes, some of which were always awake. Hence Hera appointed him to watch over the cow into which Io had been transformed. Hermes being commissioned by Zeus to carry off the cow, slew Argus by stoning him; or, as Ovid says, first charmed him to sleep by playing on the flute, and then cut off his head. Hera put his hundred eyes in the tail of the peacock, her favourite bird.—**ARGUS**, the builder of the ship *Argo* (see ARGONAUTS).

Argus, a genus of gallinaceous birds, remarkable for magnificence of plumage. The best-known species is *Argusianus argus* of Malaya and Sumatra, which is entitled to be regarded as the true Argus Pheasant. The bill is nearly as long as the head; the sides of the head and of the neck are almost destitute of feathers; the tail consists of twelve feathers, of which the two middle ones in the male are very much elongated, and the secondary feathers of the wings are much longer than the primary. The name argus has allusion to the many beautiful eye-like markings which adorn the plumage of the male, and particularly the secondary wing-feathers. The primary feathers are also exquisitely marked. The ornaments are hidden except when the male shows himself off to

his mate. 'He then erects his tail, and expands his wing-feathers into a great, almost upright circular fan or shield, which is carried in front of the body. The neck and head are held on one side,

Argus Pheasant (from Darwin).

so that they are concealed by the fan; but the bird, in order to see the female before whom he is displaying himself, sometimes pushes his head between two of the long wing-feathers, and then presents a grotesque appearance.' The marvellous decoration, according to Darwin, serves solely as a sexual charm, and the development of the ball-and-socket or eye-like markings, which he has shown to be connected by a perfect series of gradations with the simple spots, affords beautiful illustration of variation associated with *Sexual Selection* (q.v.). The decorative development seems really to have gone too far, for the size of the secondary wing-feathers is said almost to deprive the male bird of the power of flight. The female is of comparatively tame plumage, not only wanting the eye-like markings, but also the great length of the secondaries and of the middle tail-feathers. The size of the bird, when divested of its plumage, is not much greater than that of a common barn-door fowl; but the total length of the male, including tail-feathers, is over 5 feet, and the secondaries alone may be almost 3 feet long. Besides the true argus, there is another type, *Reinhardtius (Argus) ocellatus*, one of the rarest of game birds, obtained from the Tonkin highlands. The argus is impatient of confinement, and has very seldom been brought alive to Europe. See Darwin, *Descent of Man*.

Argyll, ARCHIBALD CAMPBELL, MARQUIS OF, was the descendant of Sir Colin Campbell of Lochow or Loch Awe, who was knighted in 1286, and who through his prowess bequeathed to the chiefs of his line the Gaelic title of Mac Callan Mhor ('great Colin's son') or Mac Callum More. Sir Duncan Campbell of Lochow was raised to the peerage as Lord Campbell in 1445; and Colin, his son, was created Earl of Argyll in 1457. The second earl fell at Flodden (1513); the fourth, who died in 1558, was the first of the Scottish nobility to embrace the Reformation principles; and the fifth (1530-73) figured prominently in Mary's reign, first as a Lord of the Congregation, and next as an adherent of the queen. ARCHIBALD was born in 1598, and in 1619, his father having turned Catholic and quitted Scotland, became the sole potentate of all the broad lands of his line.

He succeeded as eighth earl in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to the king and of faith in the principles against which the king made war. In the General Assembly at Glasgow (1638), he openly took the side of the Covenanters, and next year he joined Leslie's encampment on Duns Law. In 1640 he marched with 4000 men through Badenoch, Athole, Mar, and Angus, enforcing subjection to the Scottish Parliament. Charles, on his visit to Scotland in 1641, found it expedient to show peculiar favour to Argyll, and raised him to the dignity of marquis. In 1644 he dispersed the royalist forces under Huntly; but he was less successful in withstanding the genius of Montrose, who in 1645 annihilated his army at Inverlochy. His estates had suffered so much from Montrose's ravages, that in 1647 £40,000 of the public money was voted for the support of himself and his clansmen. He was strongly opposed to the execution of the king; and in 1651 he crowned Charles II. at Scone, having previously made overtures to marry him to one of his own daughters. After the defeat of Worcester, he defended himself for nearly a twelvemonth, in his castle of Inveraray, against Cromwell's troops; but in 1652 he gave in his submission to the Protector. On the Restoration, he repaired to Whitehall, encouraged by a letter from his son; but he was at once arrested, and committed to the Tower. Thence taken by sea to Leith, he was brought before the Scottish Parliament on fourteen charges of compliance with the usurpation. He defended himself with spirit, but in vain; and on 27th May 1661 he was beheaded with the 'maiden' at the cross of Edinburgh—having displayed throughout his trial, and on the scaffold, the dignity of a true nobleman, and the meekness of a Christian. Hostile views have been taken of his character, not the most favourable being Scott's in the *Legend of Montrose*; and one point is certain—he was a coward in the field.—His son, ARCHIBALD, 9th Earl of Argyll, exhibited great bravery on the disastrous day of Dunbar, where he commanded a regiment on the royalist side. After Worcester, he continued, like his father, in arms, and made himself so obnoxious to Cromwell, that he was specially excepted from the act of grace in 1654. Acting under Charles's orders, he submitted next year to the Protectorate; but from 1657 to 1660 he was a prisoner. On the Restoration, he was received into high favour (as a balance to the execution of his father), and unfortunately for his own fame, participated in some of the iniquitous acts of the Scottish legislature. Thus, in 1681 he voted in council against Donald Cargill, and signed a letter upholding the divine right in its extremest form; yet, the same year, would only sign the new test with a reservation, which led to his trial for 'leasing-making,' and his condemnation to death. The devotion of his step-daughter enabled him to escape from Edinburgh Castle in the disguise of a page; and after remaining some time in concealment, he fled to Holland. Landing in Argyllshire, in May 1685, with an armed force, to co-operate in Monmouth's rebellion, he was, after a series of misfortunes, taken prisoner, and beheaded at Edinburgh, on his former sentence, 30th June 1685.—His son, ARCHIBALD, an active promoter of the Revolution, was created Duke of Argyll in 1701, two years before his death.—His son, JOHN, 2d Duke of Argyll, was born in 1678. Destined, says Pope, 'to shake alike the senate and the field,' he as royal commissioner in 1705 had a principal share in bringing about the Act of Union; whilst as a soldier, from 1694 he distinguished himself under Marlborough

at Ramillies, Oudenarde, and Malplaquet. Previous to the change of ministry in 1710, Argyll had been a keen Whig. He now veered with the wind of the court, and became a declaimer against Marlborough. For reward he was appointed by the Tories generalissimo of the British army in Spain; but considering himself to have been unhandsomely treated by the ministry, he shortly after returned, and finding his influence greatly diminished, again turned Whig. His tortuous career up to the '15 seriously detracts from his meritorious services during that critical period, which in 1718 gained him the English title of Duke of Greenwich. His restless vanity and ambition, however, constantly prompted him to political intrigues. In 1721 he again played into the hands of the Tories, for the purpose of securing the entire patronage of Scotland. In 1737 he rose into immense popularity in his own country, by his spirited defence before parliament of the city of Edinburgh in regard to the Porteous mob. He died 3d September 1743. He was a man of lax principles and selfish character, but possessed of considerable shrewdness and talent, and noted for a kindness and courtesy in private life, which procured him the title of 'the Good Duke of Argyll,' and which are commemorated in Scott's *Heart of Midlothian*.—GEORGE JOHN DOUGLAS CAMPBELL, 8th Duke of Argyll, was born in 1823, and succeeded his father in 1847. At the age of nineteen, he wrote *A Letter to the Peers from a Peer's Son*, on the struggle which ended in the disruption of the Scottish Church; and seven years later appeared his *Presbytery Examined*. He was Lord Privy Seal (1853-55; 1859-66) and Postmaster-general (1855-58) under Lord Palmerston. Under Mr Gladstone he was Secretary of State for India (1868-74), and Lord Privy Seal (1880-81), a post he resigned, disapproving of the Irish Land Bill. His works include, besides papers on geology, a book on Iona, and a volume of poems, *The Reign of Law* (1866); *Primeval Man* (1869); *The Unity of Nature* (1884); *Scotland as it Was and as it Is* (1887); *The Unseen Foundations of Society* (1893). He died in 1900; see his *Autobiography and Memoirs*, edited by his widow (1906).—His eldest son, JOHN DOUGLAS SUTHERLAND CAMPBELL, 9th Duke (1845-1914), in 1871 married the Princess Louise, in 1878-83 was Governor-general of Canada, and in 1895-1900 was M.P. for South Manchester. He was author of tales and poems, books on Canada and imperial federation, lives of Palmerston and Queen Victoria, &c. On the Marquess and the 9th earl there are books by Willcock (1902-8).

Argyllshire, or ARGYLESHERE, a county in the west of Scotland, cut up into many peninsulas by sea-lochs, and including numerous islands. It is 115 miles long by 55 broad, and, owing to the numerous indenting sea-lochs, its coast-line extends to over 2200 miles. Next to Inverness, it is the largest county in Scotland, its area being 3110 sq. m., of which 623 belong to the islands. No part is more than 12 miles from the sea or from large inland lochs. The chief islands are Mull, Islay, Jura, Tyree, Coll, Lismore, and Colonsay, with Iona and Staffa. The general aspect of Argyllshire is wild and picturesque, the northern part being everywhere mountainous, and presenting some of the grandest scenery in Scotland, as Glencoe. The highest peaks are Bidean nam Bian (3766 feet) and Ben Cruachan (3689). The chief sea-lochs are Lochs Moidart, Sunart, Linnhe (branching off into Lochs Leven and Eil), Fyne, and Long. The streams are short and rapid, the principal being the Orchy, running through Glenorchy into Loch Awe, and the Awe connecting that lake with Loch Etive. The fresh-water lochs are Loch Awe and Loch Lydoch, the latter on the Perthshire border. The

rocks of Argyllshire are mica-slate, which predominates on the mainland; trap in Mull and Lorne; quartz rock in Islay and Jura; granite around Lochs Fyne and Etive; patches of Jurassic and Cretaceous in many of the isles; and a little old red sandstone west of Loch Fyne and in South Kintyre. Lead has been mined at Strontian (where the mineral Strontianite was discovered), at Tyndrum, and in Islay and Coll; copper in Islay and on Loch Fyne. The Easdale and Ballachulish quarries supply the best roofing-slates in Scotland. Coal occurs near Campbeltown; fine marble in Tyree, &c.; excellent granite near Inveraray; and limestone in most parts of the county. The fertile parts of Argyllshire lie along the arms of the sea and the streams. The soil is mostly a light, sandy, and gravelly loam along the coast and the sides of rivers, and gravelly, with a till bottom, on the hillsides. Whereas the total percentage of cultivated area in England is 79.3, and in all Scotland 23.5, in Argyllshire it is only 5.7. Sheep and cattle rearing is the chief occupation of the farmer, more sheep (in some years upwards of a million) being reared in Argyllshire than in any other Scottish county. Argyllshire abounds in deer and game. Loch Fyne was famed for its herrings. Loch Awe abounds in salmon and trout. In many parts of Argyllshire the peasantry are still very poor, notwithstanding that steamers now connect every portion of the coast with Glasgow, and that a railway to Oban was opened in 1880. The West Highland Railway (1894) from Glasgow to Fort William runs through parts of the east and north-east of the county. The kelp industry, introduced into Tyree in 1746, had become all but extinct in 1863. The manufactures are unimportant, the chief being whisky, in Campbeltown and Islay, and coarse woollens for home use. The principal towns and villages are Inveraray, Campbeltown, Oban, Dunoon, Lochgilphead, Tarbert, and Tobermory. The first three till 1918 united with Ayr and Irvine in returning one member to parliament; the county returns one member. Pop. (1831) 100,973; (1881) 76,440; (1911) 70,902; (1921) 76,856—one-half Gaelic-speaking. The decrease was chiefly due to emigration. The principal proprietors are the Duke of Argyll and the Earl of Breadalbane. Among the antiquities of Argyllshire are the ecclesiastical ruins of Iona and Oronsay, and the castles of Dunstaffnage, Dunolly, and Kilchurn. See Lord Archibald Campbell's *Records of Argyll* (Edin. 1886).

Argyrokastro (the Turkish *Ergeri*), a town of Albania, Turkish till the war of 1912-13, near the Dryno, an affluent of the Viosa. It contains the ruins of an imposing castellated fort. In 1814 the town was almost depopulated by the plague, and the population for half a century did not exceed 5000, but is now about 10,000.

Argyropoulos, (1) JOANNES, one of the earliest teachers of Greek learning in the West, born at Constantinople in 1416, settled finally in Italy after the fall of his native city in 1453. He taught first at Florence, and here among his pupils were the son and grandson of Cosmo de' Medici; but on the outbreak of the plague in 1471 he repaired to Rome, and there he died, probably in 1486. From his school came many learned men, among them Poliziano and Reuchlin.—(2) PERIKLES, a Greek publicist, born September 17, 1809, at Constantinople, became professor of Jurisprudence at Athens in 1837, and soon made himself more notable than popular with the court party as a promoter of constitutional state reform in Greece, especially through his journal *Anamorphosis*. Elected to the Chamber in 1843, he was foreign minister from May 1854

to September 1855, when he returned to his academic chair. He died December 22, 1860.

Aria (Ital. 'air'), in Music, a rhythmical melody, as distinct from recitative. The term was formerly applied to a measured lyrical piece either for one or several voices; but is now commonly applied to a song introduced in a cantata, oratorio, or opera, and intended for one voice supported by instruments. The 'aria grande' has taken many forms, mostly of two classes—the aria with 'da capo,' in which the first section is repeated *in extenso* after the second or intermediary one, and the aria without 'da capo,' a more varied and extended form, in which the first section may be several times repeated, and the last time generally more or less expanded into a coda. The great masters have raised it to almost symphonic importance—e.g. Beethoven's 'Ah perfido,' or Mendelssohn's 'Infelice.'—**ARIETTA** is a short melody.

Ariad'ne, daughter of Minos of Crete and Pasiphaë. She fell in love with Theseus when he came to Crete with the annual tribute of the Athenians for the Minotaur, and gave him a sword with which to slay the monster, and a clew by means of which to find his way out of the Labyrinth. For this service Theseus promised to marry her, and she escaped with him, but was slain by Artemis on the island of Naxos. Such is the account of Homer, but according to a more common tradition, she was deserted by Theseus at Naxos, where she was found by Dionysus returning from his triumph in India. The youthful god was captivated by her beauty, and married her. At her death he gave her a place among the gods, and hung her wedding-crown as a constellation in the sky. Ariadne, as left forsaken by Theseus and found by Dionysus, has been a favourite subject for works of art.

Ariano, a city of South Italy, in a pass of the Apennines, 84 miles N.E. of Naples; pop. 10,000.

Arians. See **ARIUS**.

Arias Montanus, BENEDICTUS (1527-98), Catholic divine and learned orientalist, born in Estremadura, studied at Seville and Alcalá, and became a Benedictine. He was present at the Council of Trent; in 1568 was sent by Philip II. to Antwerp to superintend the publication of the Antwerp Polyglot Bible (8 vols. folio, 1569-72); and became librarian at the Escorial.

Arica, a seaport of Tacna, the most southerly department of Peru (provisionally occupied by Chile). It is one of the chief outlets of the trade of Bolivia, and has been connected since 1854 by rail with Tacna, and since 1912 with La Paz. It exports copper, silver, sulphur, borate, soda, salt, chinchilla skins, alpaca, and vicuña wool. It was almost wholly destroyed by earthquake in 1832, but soon rebuilt. It suffered severely again in 1868, the earthquake being succeeded by fearful waves, one of them 40 feet high. In the time of the Spanish supremacy, Arica was a great commercial city with 30,000 inhabitants; its present pop. is about 9000. It was taken by the Chileans in 1880; and the department of Tacna with Arica was to be occupied by Chile until a plebiscite should decide the ultimate sovereignty. See **PERU**.

Arichat, a seaport on the south side of Isle Madame, in the province of Nova Scotia; pop. 800.

Aricia, an ancient city of Latium, at the foot of the Mons Albanus, 16 miles S.E. of Rome, and famous for the temple of Diana near it, in a grove on the lake now called Lake of Nemi (q.v.). The high-priest was a runaway slave, and obtained the office by slaying his predecessor—the usage expounded and discussed in all its bearings by Sir J. G. Frazer in his *Golden Bough* (1890; 3d ed. 1911-14).

Ariège, a department in the south of France, lying along the northern slopes of the Pyrenees. It contains some of the highest mountain-summits in France, such as Montcalm, 10,513 feet, and Estats, 10,800 feet; but is comparatively level towards the north, where the climate is milder than amongst the hills. There are extensive forests; iron, coal, and other minerals are wrought, and there are cloth manufactures. Area, 1890 sq. m. Pop. (1886) 237,619, (1921) 172,851.—The river Ariège rises in the Pyrenees, and, after a course of 93 miles, falls into the Garonne near Toulouse.

Ariel, a man's name in the Old Testament, applied also to the city of Jerusalem by Isaiah. Gesenius, Ewald, and Fürst explain the word as 'lion of God,' but most of the ancient Jewish expositors as 'hearth of God.' In later demonology, it means a water-spirit. Thomas Heywood and Milton apply it to an angel. The literary currency of the name is due to Shakespeare's use of it in his *Tempest* as a name for a particular spirit of the air. At first in the service of the witch Sycorax, mother of Caliban, for his disobedience he is shut up by his mistress in the heart of a pine-tree. Prospero frees him after his imprisonment has lasted twelve years, uses his aid to raise storms, then lets him free into his native element.

Aries, the Ram, one of the signs of the zodiac, including the first 30 degrees of the ecliptic measured from the vernal equinox, or that point where the vernal passage of the sun across the equator takes place. The vernal equinox, or, as it is also called, the first point of Aries, is constantly changing its position among the fixed stars, in consequence of the Precession (q.v.) of the equinoxes. Hence the sign Aries no longer corresponds with the constellation Aries, which was the case about two thousand years ago. The present sign Aries is in the constellation Pisces, about 30° west of the original sign. See ZODIAC.

Ar'il (*arillus*), a peculiar covering of the seed in some plants, formed by an expansion of the *funiculus* (the cord which attaches the ovule to the *placenta*). This expansion takes place after fertilisation, and sometimes invests the seed entirely, sometimes only partially. The succulent red cup round the seed of the yew is a familiar example, and the white water-lily, the passion flower, and the willow also form characteristic arils. Another accessory covering, often called the arillode, is developed from the edges of the *micropyle* (the aperture by which the pollen tube enters the ovule). This in the nutmeg forms what is called *mace*. In the spindle-tree (*Euonymus europæus*), it forms the remarkable orange-coloured covering of the seed. See OVULE.

Arimaspi, a fabulous people, supposed by the ancient Greeks to inhabit the most northern region of the world, near the Rhipæi Montes, which Ptolemy places on the site of the modern Ural Mountains. They are described by Herodotus in the fourth book of his History, as one-eyed and fierce, engaged in perpetual conflict with the neighbouring griffins for the gold hoarded by them.

Arin'os, a river in the south-west of Brazil, which, after a north-west course of 700 miles, joins the Tapajós, itself an affluent of the Amazon.

Ari'on, a celebrated lute-player of Methymna in Lesbos, about 600 B.C., regarded by the ancients as the inventor of the dithyrambic metre. Having fallen among robbers in returning to Corinth from Tarentum, where he had won the prize in a poetical contest, he threw himself into the sea after playing on his lute. A dolphin, charmed by his music, carried him on his back safely to shore. The lute and dolphin were placed among the constellations; and the story became a favourite theme with artists.

Ariosto, LUDOVICO, one of the greatest of Italian poets, was born at Reggio, September 8, 1474, being the eldest son of the military governor of that city. He was bred to the law, but abandoned it for poetry. However, at an early period of life, he was compelled to exert himself for the support of a large family, left as a burden on him at the death of his father. His imaginative powers were developed in early life. In 1503, after he had written two comedies, with several lyrical poems in Latin and Italian, he was introduced to the court of the Cardinal Ippolyto d'Este, who employed him in many negotiations, but was extremely niggardly in his rewards. Here, in Ferrara, in the space of about ten years, Ariosto produced his great poem, *Orlando Furioso*, which was published in that city in 1516, in forty cantos. After the death of the cardinal, the duke, his brother, invited the poet to his service, and acted to him with comparative kindness and liberality. In 1521 a second edition of his poems was published, the *Orlando Furioso* being still in forty cantos. Shortly after, he was commissioned by the duke to suppress an insurrection which had broken out in the wild mountain-district of Garfagnana; a task which seems more like a punishment than a mark of honour. Ariosto, however, succeeded in this arduous undertaking; and after remaining three years governor of the province, he returned to Ferrara, where he lived comfortably, nominally in the service of his patron, but in reality enjoying what he highly prized—an abundant leisure for prosecuting his studies. It was at this time that he composed his comedies, and gave the finishing touch to his *Orlando*. At length, in 1532, that poem made its appearance in a third edition, enlarged to its present dimensions of forty-six cantos. He now became seriously ill of a painful internal distemper, of which, after a few months of suffering, he died on 6th June 1533, in his 59th year. He was buried in the church of San Benedetto, at Ferrara, where a magnificent monument marks his resting-place. Ariosto is described in the Latin verses of his brother Gabrielle as a man of noble personal appearance and amiable character. His *Orlando Furioso* is a romantic, imaginative epic, marked by great vivacity, playfulness of fancy, and ingenuity in the linking together of the several episodes. It takes its name and its theme from a chivalrous romantic poem by Boiardo (q.v.), the *Orlando Innamorato*. That poem treats of the wars between Charlemagne and the Saracens, confounded as they were by tradition with those of Charles Martel, wherein Orlando, or Roland (q.v.), stood forward as the champion of Christendom. Orlando is the hero of Boiardo's piece, and falls in love with Angelica, a clever and beautiful oriental princess, sent by the Paynim to sow discord among the knights of the Christian armies. The story being left unfinished in the *Orlando Innamorato*, is taken up by Ariosto, who makes the lady fall in love with an obscure squire Medoro, on which Orlando gets frenzied, and long continues in a state of insanity. Besides his great work, Ariosto wrote comedies, satires, sonnets, and a number of Latin poems. Of these, the sonnets alone show signs of the genius of Ariosto. His Latin poems are mediocre indeed, and his comedies, besides lacking interest, are disfigured by repeated immoral and licentious passages. Only the elegance of the diction, in which Ariosto always excels, and the spirited dialogue, serve to stamp their origin. In 1845 there was discovered the mutilated manuscript of a second epic, *Rinaldo Ardito*, describing, like the *Orlando*, the battles of Charlemagne and his paladins. It was ascribed to Ariosto, but its genuineness is at least doubtful. Of the *Orlando* there are many English translations: by Harrington (1607 and 1634), Croker

(1755), Huggins (1757), Hoole (1783), and Stewart Rose (1823). In the last only is there to be found a fair representation of the feeling and spirit of the original. One of Ariosto's comedies had been rendered into English by Gascoigne as early as the year 1566.

A list of over a hundred editions of the *Orlando*, and of the lives of its author, was published by Ferrazzi in 1881. See books by Gardner (1906) and Nicholson (1914).

Ariovistus, a German chief who crossed the Rhine to help the Sequani in their struggle with the Ædui. Having gained a victory for the Sequani, he appropriated part of their territory, and soon swarms of Germans followed him into Gaul. The Sequani now joined the Ædui in imploring the help of Cæsar, who advanced to meet the Germans, and defeated them in a furious engagement, fought near Vesontium (Besançon), 58 B.C. Ariovistus, with only a few followers, escaped over the Rhine, and his subsequent history is unknown.

Arista and **Aristate**. See AWN.

Aristæus, an ancient divinity whose worship in the earliest times was widely diffused throughout Greece, but whose myth is remarkably obscure. According to the common tradition, he was the son of Apollo and the nymph Cyrene, and was born near Cyrene, in Africa. Hermes placed the child under the protection of the Horæ, or of Chiron the Centaur. After Aristæus left Libya, he went to Thebes, in Boeotia, where he was taught by the muses the arts of healing and prophecy, and where he married Autonoe, the daughter of Cadmus, by whom he had several children, including Actæon (q.v.). At Ceos, he liberated the inhabitants from the miseries of a destructive drought. He visited the islands of the Ægean Sea, Sicily, Sardinia, and Magna Græcia, leaving everywhere traces of his divine benignity. In Thrace, he was initiated in the mysteries of Dionysus; and he disappeared from the earth near Mount Hæmus. Aristæus, always a beneficent deity, was especially worshipped as the protector of vine and olive plantations, and of hunters and herdsmen. The great diversities in the legend were probably caused by the fusion into one of separate but similar local divinities.

Aristarchus (1) of SAMOS, a celebrated ancient astronomer, of the Alexandrian school, who flourished 280-264 B.C. He seems certainly to have anticipated Copernicus, maintaining that the earth moves round the sun. For this we have the testimony of Archimedes: he was even accused of impiety on this account. All his writings have perished, excepting a short essay on the sizes and distances of the sun and the moon (ed. Wallis, 1688; trans. Heath, 1913). In this he shows the method of estimating the relative distances of the sun and the moon from the earth, by the angle formed by the two bodies at the observer's eye at that moment when the moon is exactly half-luminous. The principle was accurate in theory; but the angle to be measured was too small, and the available instruments too imperfect to give accurate results.—(2) OF SAMOTHRACE, a very famous grammarian and critic, who flourished about 160 B.C. in Alexandria, where he educated the children of Ptolemy Philopator, and superintended the great library. His life was chiefly devoted to the elucidation and restoration of the text of the Greek poets—Pindar, the tragedians, and others, but especially Homer. The form in which we now have the Homeric poems preserved is in great measure owing to his judgment and industry. The strictness of his critical principles has made his name a proverbial expression for a severely just and judicious critic. He is said to have written 800 treatises, and founded a school of critics, some of whom have preserved fragments of

his works. To escape the tyranny of his old pupil, Ptolemy VII. Physkon, he fled to Cyprus, where he died at the age of 72, of voluntary starvation on account of an incurable dropsy.

Aristeas. See SEPTUAGINT.

Aristides, surnamed 'THE JUST,' belonged to a good old Athenian family, and at the battle of Marathon (490 B.C.) was one of the ten leaders. Each of these was to hold the supreme command for one day; but Aristides, who saw the folly of the system, induced his companions to give up their claims, and make Miltiades commander-in-chief. Next year, Aristides was chief archon, and in this office, as in every other, secured the general respect of the citizens. About 483 the jealousy of his great rival Themistocles procured the banishment of Aristides. It is said that when an illiterate citizen, who did not know him personally, requested him to write his own name on the voting shell, he asked the man whether Aristides had injured him. 'No,' said the voter; 'but I am weary of hearing him always styled "the Just".' Aristides submitted to the sentence with dignity, praying the gods, as he left the city, that the Athenians might not have cause to repent of their decision. Only three years later came Xerxes' overwhelming invasion. On the eve of the battle of Salamis, Aristides, hearing that the Greek fleet was hemmed in by that of the Persians, made his way from Ægina to offer his aid to Themistocles. He did good service in that great sea-fight; and, as Athenian general, he divided with Pausanias the glory of Platrea (479). In 477 B.C. he introduced a sweeping change into the constitution, by which all citizens, without distinction of rank, were admitted to the archonship. Through him, too, about the same time, Athens, not Sparta, became the ruling state of a maritime confederacy. He was an old man when he died (468), and so poor that he had to be buried at the public cost.

Aristides, a 1st century Christian apologist, whose lost work was identified in 1890 with part of Baalam and Josaphat (q.v.).

Aristippus, the founder of the Cyrenaic school of philosophy among the Greeks, was a native of Cyrene, in Africa. Having come into contact with Socrates on a visit to Athens, he became one of his pupils, and remained with the master almost up to his death, 399 B.C. He taught philosophy both at Athens and Ægina, and was the first of the pupils of Socrates to take money for his instruction. Aristippus passed a considerable part of his life in Syracuse, at the court of Dionysius, the tyrant, where he acquired the reputation of an elegant philosophic voluptuary. Plato says Aristippus was the only man he knew who could wear with equal grace both fine clothes and rags. Diogenes Laërtius records a number of his sayings, which reveal a sharp, lively, and self-complacent nature. He lived some time at Corinth, in intimacy with the famous Lais, but towards the close of his life he is supposed to have retired to Cyrene. He taught his leading doctrines to his daughter Arete, by whom they were communicated to her son Aristippus the Younger. The latter is supposed first to have systematised them, as it is more than probable that Aristippus published nothing during his life. He prided himself more upon spending his days in what he conceived to be a philosophical manner, than in elaborating a philosophical system for the benefit of mankind.

The Cyrenaic school, who carried out the doctrines of Aristippus to their legitimate conclusions, professed a great contempt for speculative philosophy and for physical and mathematical knowledge. They confined their investigations to morals, and formed an ethical system completely in harmony

with the gay, self-possessed, worldly, and sceptical character of their master. Its chief points were: (1) that all human sensations are either pleasurable or painful, and that pleasure and pain are the only criterions of good and evil; (2) that pleasure consists in a gentle, and pain in a violent motion of the soul; (3) that happiness is simply the result of a continuous series of pleasurable sensations; (4) that actions are in themselves morally indifferent, and that men are concerned only with their results. The great philosophic sensualist stood out in strong relief against the gloom and austerity of Antisthenes and the Cynic school. The doctrine that makes pleasure the chief good is often called *Hedonism* (from Gr. *hēdonē*, 'pleasure').

Aristobulus, an Alexandrian Jew and peripatetic philosopher, who lived about 170 B.C., was considered by the early fathers as the founder of the Jewish philosophy in Alexandria. He is said to have been the author of an allegorical commentary on the books of Moses, which showed that the oldest Greek writers borrowed from the Hebrew Scriptures; but it is now admitted that this work was written by a much later writer.—For the Hasmonean or Maccabee princes of this name, in 106 B.C. and 64 B.C. respectively, see JEWS.

Aristocracy (Gr. *aristocratia*, from *aristos*, 'best,' and *kratos*, 'power') means etymologically the power or government of the best men. As used by Plato and Aristotle, it meant the government of a class, whose supremacy rested not on wealth alone, but on character and personal distinction. In point of fact, that class was a privileged one, consisting of the leading families, in which wealth and good-breeding were hereditary, and which long experience had trained to a habit of command. In an aristocracy, it was implied that the government of affairs should be for the public good, and not in a class interest. Oligarchy was a degenerate phase of aristocracy, in which the rule of the minority was founded on wealth, and conducted in its own narrow interests. Almost all countries have passed through a stage in which government has been in the hands of a privileged class, which may be called an aristocracy (when the class is markedly small in numbers, and narrow in spirit and policy, such rule is generally called an oligarchy). So it was in ancient Rome, and in the Italian states of the middle ages. In most of the European states, noble families have been powerful, at certain periods co-ordinate with the royal power, and even effacing it. The absolute states of modern times were based on the subordination of the noble families to the royal power. The king and aristocracy more recently combined to resist liberalism or constitutionalism. In modern English history, especially after the revolution of 1688, the government was really an aristocratic one for about a century and a half. That is to say, for that period the ruling power consisted of the noble families, only very partially controlled by the king or limited by the industrial class. The aristocratic element, still influential in most European countries, was (before the Great War) strongest in Prussia. The rights of the hereditary peers to constitute the second chamber in the British parliament were keenly disputed in and after 1910. See DEMOCRACY, GOVERNMENT.

Aristogeiton. See HARMODIUS.

Aristolochia, a genus in the dicotyledonous order Aristolochiaceae, including many herbs and shrubs (frequently climbers), specially abundant in tropical South America. Its affinities are obscure, owing to the peculiarly aberrant structure of its flowers: the tubular oblique perianth, dilated at its base, and the stamens adherent to the stigmas, are especially remarkable, and these characters are

associated with a no less peculiar mode of fertilisation. The fertilising insects (usually small flies) attracted by the expanded and coloured lip of the perianth, as well as by the frequently powerful and fetid odour, descend the narrowed perianth tube into the dilated base. Thence they are prevented from returning by the downward-directed hairs, with which the perianth tube is lined; these, however, wither when the stamens are fully matured, and the flies escape, dusted with pollen,

Aristolochia clematitis:
a, flower on larger scale; b, section of flower.

to enter another flower, and there become again imprisoned until after they have had abundant time to fertilise the stigmas, and acquire a new load of pollen in their efforts to escape. Several species of *Aristolochia* are found in the south of Europe; one only, the common Birthwort (*A. clematitis*), occurs upon the Continent as far north as about lat. 50°, and is a doubtful native of England. The order is, however, also represented in Britain by *Asarum europæum*, or *Asarabacca* (q.v.). It has a long branching root, with an unpleasant taste and smell, which, with the roots of *A. rotunda* and *A. longa*, two herbaceous species, natives of the south of Europe, was formerly much used in medicine, being regarded as of great service in cases of difficult parturition, whence the name (Gr. *aristos*, 'best,' and *iocheia*, 'childbirth'). These roots possess powerful stimulating properties, and those of the southern species are still used as emmenagogues. The root of *A. indica* is used in the same way by the Hindus.—*A. serpentaria*, Virginian Snakeroot, is a native of most parts of the United States, growing in woods. The root has long been a fancied remedy for the bite of the rattlesnake. It possesses stimulant and tonic properties.—Its reputation as a cure for serpent-bites is shared by other species, particularly *A. anguicida* and *A. guaco* (the Guaco of Colombia), natives of the warmer parts of America; and it is said that a number of species are used by Egyptian jugglers, in order to their handling serpents with impunity.—Several South American species seem also to possess medicinal properties analogous to those of the Virginian Snakeroot.—*A. Spho*, a climbing shrub, of 15 to 20 feet in height, a native of the southern parts of the Alleghany Mountains, is frequently planted to form shady bowers, on account of its very large heart-shaped leaves (a foot in breadth), of a beautiful green. From the

bowl-shaped base of its perianth, the plant has also received the name of Pipe-shrub, Pipe-vine, or Dutchman's Pipe.—Tropical species are distinguished for their beauty and the peculiar forms of their flowers, and are frequently cultivated in our hot-houses.

Aristophanés, the greatest of Attic, if not of all, comedians, was born about 448 B.C. His father held property in Ægina, which explains the poet's allusion (*Acharnians*) to the claim of that island by the Spartans, in order to secure him, and also his prosecution by Cleon on the charge of usurping civic rights. Of his personal history we have nothing recorded, except his deme and tribe, and that he had three sons—Philippos, Araios, and Nikostratos—all comic poets. The old comedy, of which Aristophanes is to us the representative, exercised an influence akin to that of the public press of our day in pamphlets and newspaper articles; it claimed to be guardian and censor of public morals, and the critic of current events. During the sixty years in which it flourished under the Athenian democracy, its distinctive feature was its plain-spoken and personal character. Full license for riotous fun and banter was given it by the season of its exhibition—viz. the Dionysiac festival. Its shafts were chiefly aimed at radical tendencies and novelties of any kind. Its plots were political burlesques; its famous *parabases* were addresses of the chorus to the audience, explaining its views on subjects of the moment—somewhat like the topical song in our pantomimes. Aristophanes is said to have written fifty-four plays, but eleven only are extant, which may be ranged under the categories of political, philosophical, social, and literary; and again under three periods, ending respectively 425, 406, and 388 B.C., about which last date he died. To the first period belong (1) the *Acharnians*, (2) the *Knights*, (3) the *Clouds*, (4) the *Wasps*, the poet's four masterpieces, named from their respective choruses, and (5) the *Peace*, in all of which full rein is given to political satire. To the second, (6) the *Birds*, (7) the *Lysistrata*, (8) the *Thesmophoriazusæ*, (9) the *Frogs*, in which we find less political rancour, and more reticence and caution. To the third, the *Ecclesiazusæ* and *Plutus*, comedies of a tamer type, known as that of the middle comedy, in which political allusions and the distinctive characteristic of the old comedy, the *parabasis*, disappear.

Aristophanes made his debut with the *Revellers* (427 B.C.), in which the teaching of the Sophists, then becoming fashionable, is contrasted with the simplicity of the old education. It was followed by the *Babylonians*, a satire on the various magistracies in Athens, which contained incidentally a preliminary attack on Cleon, one of his *bêtes noires*, to which the poet alludes in his next year's play, the *Acharnians* (425 B.C., the seventh year of the Peloponnesian war). This was brought out, as were also the other two, in the name of Kallistratos. In this, the first of his eleven extant plays, Aristophanes pleads the cause of the aristocratic peace-party against the democratic war-party, whose selfish aims and place-hunting, disguised under the cloak of patriotism, he exposes with unsparing ridicule. Dikaiopolis, an honest farmer, concludes a peace for thirty years between himself and family on the one side, and the Spartans and their allies on the other, and keeps the rural Dionysia after six years' interval. The old charcoal-burners of Acharnai, who will not hear of peace, because their lands have been ruined by the Spartan invasion, attack him; but he pleads the enemy's cause, and converts half the chorus to his view, while the malcontent half fetch the swash-buckler general Lamachos to overawe the traitor. Dikaiopolis holds open market with the sworn enemies of

Athens, and enjoys himself in the midst of his good cheer, while Lamachos is depicted in piteous flight and mortal pain, after the hardships of campaigning.

The *Knights* (424 B.C.) was the first play produced in the poet's own name. It is aimed entirely at Cleon the tanner, the most prominent demagogue of the day, whose success at Pylos was a bitter disappointment to his opponents. Dēmos, the Athenian John Bull, is a cross, dull-witted, and superstitious old man, who has intrusted the management of his household to a bullying Paphlagonian slave (Cleon). Two of his fellow-slaves (Demosthenes and Nicias) conspire against his tyranny, with the Knights, who represent the richer classes of Athens, and contrive that he shall be supplanted by a sausage-seller. Dēmos is then renovated by being boiled, and becomes youthful and sensible once more.

The *Clouds* (423 B.C.) is a protest against the growing spirit of scepticism at Athens, where it was becoming the fashion for youths to frequent the new schools of the Sophists. To the conservative instincts of Aristophanes this was bitter gall, and he ridiculed the whole profession with Socrates at their head. The latter, by his ungainly personality and eccentric habits, was a good subject for caricature; but Aristophanes' picture is no truthful portrait of the great philosopher, one of whose chief aims and merits was to expose shams.

Stepsiadēs is being ruined by his spendthrift son Pheidippides (Alcibiades). His only chance of safety is to send his son to the 'Phrontistery' or *Pensoir* of Socrates, where he will learn to make the worse appear the better reason, which his creditors unfortunately hold. The son bluntly refusing, the father goes himself, but proves too stupid and forgetful to learn; so the son reluctantly enters the school, and learns the worse reason with a vengeance. In the famous dialogue between the Just and the Unjust Argument, the latter wins the day, and so obtains the control of the pupil, who is imbued with the new ideas so thoroughly, that, at a feast given him by his father on his return home, he sings an immoral speech from Euripides, beats his father, and justifies the act by his newly learned sophistry. The eyes of the old man are opened, and he wreaks his vengeance on Socrates by setting the *Pensoir* and its inmates on fire.

The *Clouds* is unequalled in ancient comedy for simplicity and perfection of plot, and morality of tone. It is the nearest approach to a modern French play; it exhibits the development of a possible action and real characters, and not merely a string of comic situations. In repartee it is not excelled by any play of Molière, and Shakespeare at his best shows no richer humour.

The *Wasps* (422 B.C.), of which Racine's one comedy *Les Plaideurs* is an imitation, is a counterpart of the *Clouds*, in which a father converts his son, while in the *Wasps* a son reforms his father. The two principal characters are Philocleon, an old dikast, and his son Bdelycleon, who tries to cure his father of his mania for sitting in the court, and gets up for him a mock trial of a dog at home. In the latter half of the play, the vulgar element predominates; it represents Philocleon's conversion to the ways of society, but he behaves unexpectedly with more than the license of youth.

The *Peace* (421 B.C.) may be called a leading article in favour of the Peace of Nicias, when both Cleon and Brasidas were dead. The first half of the play represents the recovery of Peace from heaven, whither Trygæos had gone on a beetle's back to fetch her; the second, the social enjoyments which welcome her restoration to the earth. Its hearty humour, its beautiful descriptions of rural life and its pleasures, are inimitable.

The *Birds* (414 B.C.) is a brilliant pantomime. Its aim is vague if looked on as a satire. It was composed at a period of great excitement, when Athens was in the fever-heat of preparation for the Sicilian expedition, and Alcibiades was in every mouth, but it was not produced until eight months afterwards. Peithetairos (Alcibiades) and his friend Euelpides start a scheme for making the birds build a city (Cloud-cuckoo-town) in mid-air, and establish their sovereignty, so as to shut off the gods, and intercept men's offerings to them. The gods submit and allow Basileia, daughter of Zeus, to be married to Peithetairos.

The *Lysistrata*, or 'Strike of the Wives' (411 B.C.), exhibits the women of all Greece taking the question of war into their own hands, and refusing their lords their rights until they consent to make peace.

The *Thesmophoriazuse*, the most diverting of all Aristophanes' plays, was brought out three months later. It contains an attack on the morality of Athenian women and on Euripides; it does not interfere in politics.

The *Frogs* (405 B.C.) is a literary criticism. The first part contains the adventures of Dionysos on his journey to Hades in search of a good poet, Sophocles and Euripides being just dead; the second, the poetical contest between Æschylus and Euripides, and the victory of the former.

In the *Ecclesiazuse* (393 B.C.), or 'Ladies in Parliament,' Aristophanes satirises the communistic theories which were afloat, by making the women occupy the Pnyx, disguised as men, and decree a new constitution with full community of property and wives. The play is remarkable for its witty repartee.

The *Plutus* (388 B.C.) is unique among Aristophanes' plays. It is a satire on humanity; its subject, the unjust distribution of wealth, the cause of which is the blindness of Plutus. His sight is restored to him by Asklepios, and then matters are righted; the god bestows his favours only on the deserving, to the ruin of many evil trades.

The choruses are the part of his work on which Aristophanes lavished the greatest wealth of his exuberant fancy. A study of these will give an idea of the varied resources of his genius, passing with prodigious fullness of the most comical fancies to the most charming descriptions, such as recall the idyllic grace of Theocritus, and to the most sublime conceptions.

The first printed edition of Aristophanes was the Aldine (Venice, 1498); it contains nine plays. Junta (1515) added two. Notable editions were those of Brunck (1783), Bekker, Dindorf, Bergk, Meineke (1860), Blaydes (1886), Holden, and of single plays by Kock, Merry, Neil, Rennie, Starkie. Rutherford's *scholia* on the Ravenna MS. (the oldest; 1896) are important. There are translations by Mitchell (4 plays, 1822), J. H. Frere (5 plays, 1847), Walsh, Kennedy, Tyrrell, and B. B. Rogers (with revised text, 1852-1911; new ed. 1902 *et seq.*).

Aristotelia. See MAQUI.

Aristotle was born at Stagira (Stageira), a Greek colony on the Macedonian peninsula Chalcidice, in the year 384 B.C. He belonged to a family in which the practice of physic was hereditary. His father, Nicomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip, and grandfather of Alexander the Great. Aristotle lost both parents while he was quite young, and was brought up under the care of Proxenus, a citizen of Atarneus, in Asia Minor, who was then settled at Stagira. It is to be conjectured that his education would take the direction of preparing him for the family profession. In after-life, he occupied himself largely in the dissecting of animals, and was acquainted with all

the facts that had been derived from this source by others before him. It seems probable, however, that he early abandoned the intention of following physic as a profession, and aspired to that cultivation of universal knowledge for its own sake, in which he attained a distinction without parallel in the history of the human race.

In his 18th year (367 B.C.) he left Stagira for Athens, then the intellectual centre of Greece and of the civilised world. Plato, on whom he doubtless had his eye as his chief instructor, was then absent at Syracuse in that extraordinary episode of his life, connecting him as political adviser with the two successive Syracusan despots—Dionysius the Elder, and Dionysius the Younger—and with Dion. Aristotle, therefore, pursued his studies by books, and by the help of any other masters he could find, during the first three years of his stay. On the return of Plato, he became his pupil, and soon made his master aware of the remarkable penetration and reach of his intellect. We are told that Plato spoke of Aristotle as the 'intellect of the school.' Unfortunately, there is a total absence of precise information as to the early studies of the rising philosopher. He remained at Athens twenty years, during which the only facts recorded, in addition to his studying with Plato, are, that he set up a class of rhetoric, and that in so doing, he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens got the principal part of their education for public life. They learned the art of speaking before the *Dikasteries*, or courts of law, and the public assembly, with efficiency and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that Aristotle would look with contempt upon the shallowness—in all that regarded thought or subject matter—of the common rhetorical teaching, of which, doubtless, the prevailing excellence would lie in the form of the address, being artistic rather than profound or erudite. One of the disciples of Isocrates, defending his master against Aristotle, wrote a treatise wherein allusion is made to a work (now lost) on proverbs, the first recorded publication of the philosopher.

The death of Plato (347 B.C.) was the occasion of Aristotle's departure from Athens. It was not extraordinary or unreasonable that Aristotle should hope to succeed his master as the chief of his school, named the Academy. We now know that no other man then existing had an equal title to that pre-eminence. Plato, however, left his nephew Speusippus as his successor. We may suppose the disappointment thus arising to have been the principal circumstance that determined Aristotle to stay no longer in Athens; but there are also other reasons that may be assigned, arising out of his relations with the Macedonian royal family at a time when the Athenians and Philip had come into open enmity.

Whatever may be the explanation, he went in his thirty-seventh year, after a stay of nearly twenty years in Athens, to the Mysian town of Atarneus, opposite to the island of Lesbos. Here he lived with Hermeias, the despot of the town, a man of singular energy and ability, who had conquered his dominion for himself from the Persians, at that time masters of nearly all Asia Minor. Aristotle had taught him rhetoric at Athens, and he became in return the attached friend and admirer of his teacher. For three years the two lived together in the stronghold of Atarneus until the death of Hermeias at the hands of a treacherous enemy. Aristotle took refuge in

Mitylene, the chief city of Lesbos, taking with him Pythias, the sister or niece of Hermeias, whom he made his wife. In a noble ode he has commemorated the merits of his lost friend. His wife, Pythias, died a few years afterwards in Macedonia, leaving him a daughter of the same name. His son, Nicomachus—whose name, for whatever reason, has been given to the chief of the ethical writings that have come down to us among the works of Aristotle, the *Nicomachean Ethics*—was born to him at a later period of his life by a concubine.

After two years' stay at Mitylene, he was invited (in the year 342 B.C., age 42) by Philip to Macedonia, to educate his son Alexander, a boy of thirteen, who for at least three years was the pupil of Aristotle. The two parted finally when Alexander set forth on his expedition into Asia (334 B.C.), and Aristotle came from Macedonia to Athens, having recommended to the future conqueror, as a companion in his campaigns, the philosopher Callisthenes, whom he had educated along with Alexander. Now at the age of 50, he entered on the final epoch of his life; he opened a school called the 'Lyceum,' from its proximity to the temple of Apollo Lyceus. His followers came to be called the *Peripatetics*, either from his practice of walking up and down in the garden during his lectures, or because the place was known as 'The Walk' (*Peripatos*). The tradition that it was his habit to give a morning lecture to select pupils on the more abstruse subjects, and one in the evening of a more popular kind to a general audience, is based upon a mistake. This crowning period of his life lasted twelve years. After the death of Alexander, the anti-Macedonian party at Athens obtained the ascendancy, and among other consequences, an accusation was prepared against Aristotle, the pretext being impiety. With the fate of Socrates before his eyes, he chose a timely escape, and in the beginning of 322 B.C., took refuge at Chalcis in Euboea, where, in the autumn of the same year, he died, aged 62. He had long been afflicted with indigestion, and ultimately sank under this malady.

Many of the details recorded of Aristotle's life, coming as they do from late and very uncritical authorities, must be considered uncertain; but the foregoing account may be accepted as in the main correct.

Of the numerous writings which have come down to us under the name of Aristotle, some are undoubtedly not his; some may be the products of his school, though not the direct work of the master himself. Even of his most famous and undisputed works, the structure is so irregular, and the style so unequal, that it has been with great probability supposed that they are to a large extent not finished writings, but notes and rough jottings edited by disciples, sometimes perhaps more reverent than judicious. There is indeed a story told by Strabo the geographer, who lived in the time of Augustus, that the works of Aristotle were first collected and edited by Andronicus of Rhodes (70 B.C.). How far this may account for the condition of 'our Aristotle' is a matter of dispute among scholars. We hear (e.g. from Cicero) of Dialogues written by Aristotle. Of these only a few unimportant fragments remain. They were probably written whilst he was still Plato's pupil. Those works which we possess all belong, apparently, to the last twelve years of his life (though the materials for them may have been collected previously), and it is therefore likely enough that many of them were left unfinished at his death. The commentaries written on some of these works by ancient scholars (e.g. Alexander of Aphrodisias, Themistius, Philoponus, Simplicius) during the early centuries of

the Christian era, form of themselves a great mass of literature.

In the middle ages, Aristotle's philosophy became known to the learned in the Western Church, at first mainly through Arabian translations, which in their turn were translated into Latin. The Arabian philosophy (of Avicenna, 1000 A.D., and Averroes, 1150 A.D.) was based upon Aristotle, with the addition of Neoplatonic elements. At the time when what was supposed to be the Aristotelian system was (especially through the influence of Thomas Aquinas, died 1274 A.D.) dominant in Western Europe, Aristotle's works were hardly known to any one in the original; nor could they have been appreciated in an unscientific age. The Aristotelianism which the medieval schoolmen admiringly followed, and which, at a later time, Bacon and others as blindly attacked, was very different in spirit from the real philosophy of Aristotle. For the history of Aristotelianism in the middle ages, see SCHOLASTICISM.

The method and system of Aristotle are frequently supposed to be in complete contrast to those of his master Plato. It is said 'Plato was an idealist, Aristotle an empiricist,' &c. This is misleading: the difference is great in appearance mainly; and this appearance is partly due to Aristotle's habit of criticising Plato very severely, though, on the whole, the relation between the two philosophers has been well expressed by Sir Alexander Grant's phrase that 'Aristotle codified Plato.' There is certainly a great difference in temperament between them, and a very great difference in literary manner. Plato was a poet, and is always an artist, as well as a thinker, in his Dialogues. Aristotle, with the education of a physician, has the mental habits and tendencies of the man of science predominant; and while lacking Plato's inspiration and enthusiasm, has a wider, in fact, an all-embracing range of interests, and cares more for actual facts for their own sake. He appears to have projected what may be called an Encyclopedia of Philosophy, though the scheme is only imperfectly carried out in his works.

Aristotle distinguishes three kinds of thinking: (1) Theoretic; (2) Practical; (3) Productive. Corresponding to these we have three divisions of Philosophy: (1) Theoretic Philosophy is subdivided into (a) First Philosophy or Theology; (b) Mathematics; (c) Physics—i.e. the Philosophy of Nature. (2) Practical Philosophy is subdivided into (a) Ethics; (b) Economics (i.e. the practical science of household management, to which *Chrematistic*, the science of wealth, is only a subordinate science); (c) Politics. (3) Poetic (Productive) Philosophy, corresponding to what we should call the Philosophy of Art, would apparently be subdivided according to the different arts (painting, sculpture, poetry), but Aristotle has not specially treated of any branch except poetry.

Logic, which Aristotle himself calls 'analytic,' does not form a division of philosophy, but is rather a study of the method of scientific proof (which aims at truth). The term 'logical' Aristotle applies specially to dialectical argument (which aims at refutation of opponents). Aristotle's followers held (in opposition to the Stoics, who divided all philosophy into logic, physics, ethics) that logic was not a part of philosophy, but its 'instrument' (*Organon*). Hence this name was given to the Aristotelian treatises on the subject. In the subsequent history of the science, the most influential of these treatises have been the *Categories* (containing the famous list of ten classes of predicates, substance, quality, quantity, &c.) and the *Prior Analytics* (containing the doctrine of syllogistic moods and figures); but for

the student of Aristotelian philosophy the most important is the *Posterior Analytics*, which contains his theory of knowledge and of scientific method. The defects which modern logicians have found in the Aristotelian logic are due mainly to the fact that the only science which in his day had reached a sufficiently advanced stage to have its method fairly analysed was the science of geometry. The analysis of its methods could hardly furnish an adequate account of the processes of reasoning in the less abstract sciences of nature. Formal deductive logic has hardly undergone any important modifications since Aristotle's time; but the so-called Aristotelian logicians have often had little enough of Aristotle's scientific spirit. Aristotle himself boasts with truth that in working out the theory of reasoning (*sylogism* is only the Greek term for 'reasoning' or 'inference') he had no predecessors.

In the *Rhetoric*, Aristotle deals with the art of persuasion. In this subject he had predecessors; but most subsequent treatises have added little to what he has said. This work, though usually classed along with the *Poetics*, since both deal with literature, may also be properly connected with the logical writings, the longest of which, the *Topics*, deals with dialectical argument and reasoning from probabilities.

The name *Metaphysics* (i.e. 'after the Physics') was given to Aristotle's discussions on 'first philosophy,' because they were placed by his editors *after* his books about nature. The work is in a very confused condition, and is in consequence extremely difficult. It begins with a sketch of preceding Greek philosophy, leading up to a criticism of Plato's doctrine of 'ideas' or universals. In opposition to Plato, Aristotle insists that reality is to be found only in individual things, each of which is a combination of *Form* (the universal element) and *Matter*; but his own doctrine, that knowledge can only be of universals, is the same as Plato's, though stripped of Plato's paradoxical modes of expression. His most important advance beyond Plato consists in his thoroughgoing application of the distinction of the *potential* and the *actual*. Actuality (realisation) and potentiality correspond to form and matter respectively, but the former terms are dynamical, the latter statical. All being he regards as a continuous ascending scale from mere matter (about which, because it is quite destitute of form, we can say nothing) up to the pure actuality, or 'thought thinking itself,' which he calls God. (Hence the name Theology also given to the 'first philosophy'—'first,' because it deals with the highest and ultimate problems of being.) Any individual object is intermediate between these two extremes, though at different stages—e.g. a block of marble is less formed, less actualised, than the statue made of it. In trying to understand or explain any individual object, we must consider it in four ways: (1) What are the material conditions of its existence? (2) What is its form or essential character as formed or realised? (3) Through what agency does it come into being? (4) What is the end or result attained by it? This is the famous doctrine of the 'Four Causes,' called respectively material, formal, efficient, final.

The books called the *Physics* deal mainly with what we should call the metaphysical aspects of movement (under which conception Aristotle includes growth and qualitative change), time, place, &c. Aristotle's application of his speculations about motion to a theory of the physical universe, exercised a bad influence (especially in the case of astronomy) on those whose admiration led them to accept his opinions as unquestionable dogmas.

The subject of mathematics he does not expressly treat himself, that science having already become sufficiently specialised and separated from the other departments of human thought. His works on Animals, though now possessing only an antiquarian interest, prove him to have been a close and acute observer of nature so far as, in the absence of all scientific aids to observation, his limited opportunities went; nor did he, as often alleged, neglect experiment, though doubtless not fully aware of its importance. Many modern biologists have been ready to bear testimony to the genuinely scientific character of his observations; and, indeed, his metaphysical theory provided him with an evolutionary conception of nature such as has only been recovered in recent times. His book *On the Soul* is as much a biological as a psychological treatise (for 'soul' means for him the vital principle in plants and animals, of which the thinking human soul is only the highest stage); yet in this treatise he may be regarded as the founder of psychology as a distinct science. In one of his shorter treatises, which deals with memory, he gave a first statement of the law of association of ideas.

His *Ethics* and *Politics*, though apparently less studied, at least less commented on, in antiquity than his other works, have in medieval and modern times exercised an enormous influence. Thus his conceptions of the various virtues and vices have, because of their adoption by St Thomas Aquinas and other medieval doctors, passed into European literature—e.g. in Dante, Spenser, &c. At the revival of letters, and at the Reformation, when antipathy to medieval theology caused a general disparagement of Aristotle's philosophy, Aristotle's *Politics* exercised a direct influence on the rise of modern political philosophy; it even helped to keep alive ideals of political liberty in an age when rulers were becoming more absolute and despotic. Aristotle is said to have made a collection of 158 'Constitutions,' as a preparation for writing his *Politics*: of these the most important was the *Constitution of Athens* (see below). The *Economics* are not considered to be a work of Aristotle's own. His observations on the subject are to be found in Book I. of the *Politics*. In his remarks on *Chrematistic* (*Pol.* i. 8-11) are to be found the first germs of the science now called 'Political Economy.'

The *Poetics* is an incomplete work, and contains little more than a discussion of tragedy; but even so, few, if any, books on literary criticism have had more influence—and here, as elsewhere in the case of Aristotle, partly through misunderstandings. The famous doctrine of 'the three dramatic unities' is not in the *Poetics*. Only the unity of plot is insisted on by him.

The great edition of Aristotle is still that of Bekker, published by the Prussian Royal Academy (Berlin, 1831-40). Aristotle is now generally quoted by scholars according to the pages, columns, and lines of this edition. Bekker's text has been reprinted at Oxford (1837; 11 vols. 8vo). The Berlin edition also includes Latin translations, *Scholæ* edited by Brandis, and a complete *Index* by Bonitz. The best edition of the ancient commentaries is that published at Berlin in 25 vols. There are excellent critical texts of some parts of Aristotle (*Eth.*, *Pol.*, *De An.*) published by Teubner, Leipzig. In Germany there has been a great succession of Aristotelian scholars, who have edited, translated, and expounded portions of his writings—e.g. Bonitz (ed. *Metaph.*), Schwegler (ed. and trans. *Metaph.*), Trendelenburg (ed. *De An.*), Torstrik (ed. *De An.*), Waitz (ed. *Organon*), Susemihl (ed. and trans. *Politics*), &c. An English translation of the whole, edited by Smith and Ross, was begun in 1909. The *Nicomachean Ethics* was edited with commentary by Sir A. Grant, who also wrote *Aristotle in Ancient Classics for English Readers*; there is a translation by Peters. The *Ethics* was edited by Burnet in 1904. The *Politics*

was edited by W. L. Newman, translated by Jowett and by Welldon. The *Rhetoric* was edited by Cope and translated by Welldon. The *Poetics* has been translated by Twining and by Wharton (1883), edited by Moore and by Tucker (1899), edited and translated by Bywater (1898-1909), and edited, translated, and discussed by Butcher in *Aristotle's Theory of Poetry and Fine Art* (1895). The *De Anima* has been translated and expounded by E. Wallace, who also wrote *Outlines of the Philosophy of Aristotle*. Poste's translation of *Post. Anal.* and edition of *Soph. Elench.*, and Dr Ogle's translation of *The Parts of Animals*, may also be named among the few good English works on Aristotle. For general accounts of Aristotle's philosophy, besides the writings of Grant and Wallace already mentioned, there are Grote's *Aristotle* (though only the *Organon* is treated in any detail), and Zeller's *History of Greek Philosophy*.—The *Constitution of Athens*, of which only fragments had been known, was discovered almost complete in a papyrus from the Fayum in the British Museum, of which the text, followed by a fac-simile, were published by F. G. Kenyon in 1891. Improved texts were issued by Kaibel and Wilamowitz-Moellendorf (Berlin, 1891), and by Van Herwerden and Leeuwen (Leyden, 1891); and English translations by Kenyon, Dymes, and Poste. The elaborate edition by J. E. Sandys (1893) accepts the text as mainly the work of Aristotle himself, and as the book studied and quoted in antiquity as his, portions being possibly due to a pupil. Others have tried to make out that it is mainly the work of a pupil. See SOLON.

Aristotle's Lantern. See SEA-URCHINS.

Aristoxenus OF TARENTUM, a pupil of Aristotle, and one of the oldest writers upon music, flourished about 350 B.C. Except some fragments, we only possess his *Elements of Harmony* (ed. Margard, Berlin, 1869).

Arithmetic is the science that treats of numbers (Gr. *arithmos*). It is sometimes divided into theoretical and practical; the former investigating the properties of numbers and their combinations, the latter applying the principles so established, in the form of rules, to actual calculations. Some restrict the term arithmetic to this art of reckoning, assigning the investigation of the principles to analysis. Anciently the science of reckoning was usually called *logistic*; while arithmetic dealt with forms of numbers, primary numbers, &c.

Arithmetic is said to have been first developed into a science in India; the Egyptians reckoned the god Thoth the first teacher of numeration. Among the ancient Greeks and Romans, arithmetic made little progress, owing to their clumsy modes of notation. Few of their writings on the subject have come down to us; the most important are those of Euclid, Archimedes, Diophantus, and Nicomachus. After the introduction of the decimal system and the Arabic or Hindu numerals (see NUMERALS), about the 11th century, arithmetic began to assume a new form. Early in the 13th century, Sacro Bosco wrote his *Algorithmus seu Arithmetice Introductio*; Pacioli wrote in the 15th century; and in the 16th, Adam Riese and Apianus. It was not till the 16th century that the Double Rule of Three, or Compound Proportion, was discovered, and decimal fractions were introduced. The invention of Logarithms in the 17th century is the last great step in advance that the art has made. The elementary operations in Arithmetic are Addition, Subtraction, Multiplication, and Division. The subjects of Fractions, Decimals, Practice, Proportion, Logarithms, Interest, Discount, Involution and Evolution, will be noticed in their proper places. Annuities, Averages, Insurance, Mensuration, and Partnership give rise to branches or special applications of arithmetic. The various methods of Notation and the forms of the numerals employed by the Greeks, Romans, Chinese, and other nations, are separately treated at SCALES OF NOTATION AND NUMERALS. The theory

of Numbers (q.v.) is a subject cognate to arithmetic. See also ALGEBRA and ANALYSIS. Contrivances such as the Abacus, the Calculating Machine, and Napier's Bones, are treated under their own heads.

Arithmetical Mean is that number that lies equally distant between two others: thus, the arithmetical mean between 11 and 17 is 14, which is found by taking half their sum.

Arithmetical Progression is a series of numbers that increase or diminish by a common difference, as 7, 10, 13, 16, 19, 22; or, 12, 10½, 9, 7½, 6. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms. The series of natural numbers, 1, 2, 3, 4, &c. form an arithmetical progression, of which the difference is 1.

Arithmetical Signs are arbitrary marks or symbols used to denote the operations to be performed on numbers, or the relations existing between them. The sign of Addition is +; of Subtraction, -; of Multiplication, ×; of Division, ÷; of Equality, =. De Morgan, followed by Stokes and others, introduced for division the convenient symbol /; thus, 18/3 has the same meaning as 18 ÷ 3 or 18/3. The same signs as in Arithmetic are also used in Algebra; and an enumeration and explanation of them may be found in almost any treatise on either subject.

Arius (Gr. *Areios*), the celebrated founder of Arianism, was a native of Libya, and is generally supposed to have been born shortly after the middle of the 3d century. About the year 306 A.D., Alexandria was thrown into confusion by the violence of its religious disputes, and in these Arius was largely concerned. At first, he took part with Meletius, Bishop of Lycopolis, in Upper Egypt, a man who was strenuously opposed to certain notions of discipline entertained by Peter, Bishop of Alexandria. He was excommunicated by Peter in consequence; but the latter dying soon after, Achilles, his successor, restored him to his office, and even advanced him to the dignity of a presbyter, 313. Arius was first brought into collision on a point of doctrine with his ecclesiastical superiors in 318. Alexander, the successor of Achilles, having in a public assembly of clergy, while speaking of the Trinity, said that it contained one single essence, or indivisible unity of substance, Arius alleged that such a conception was impossible to the human mind, and accused Alexander of Sabellianism—i.e. of destroying the distinction of persons. In maintaining his ground, Arius went beyond his first statement of the absolute distinctness of person between the Father and the Son; he maintained that the Son was not co-equal or co-eternal with the Father, but only the first and highest of all finite beings, created out of nothing by an act of God's free-will, and that he ought not to be ranked equal with the Father.

Arius was successful in securing the adherence of large numbers both of the clergy and laity in Egypt, Syria, and Asia Minor. In 321 a synod of bishops at Alexandria deposed and excommunicated him. To escape persecution, he retired to Palestine, whence he wrote a letter to his friend Eusebius, Bishop of Nicomedia. Eusebius warmly sympathised with him; wrote in his behalf to Paulinus, Bishop of Tyre, and others; absolved him from the Alexandrian synod's excommunication; and in 323 convened another synod in Bithynia, which pronounced favourably on Arius. While Arius was residing at Nicomedia, he wrote a theological work in verse and prose, called *Thaleia*, some fragments of which remain. The *Thaleia* is said to have been sung by the Arian neophytes, who thus kindled the passions of their adversaries, and increased the virulence of the contest. The

comedians, who were pagans, took advantage of the occasion to ridicule the Christian religion in the theatres.

It now became impossible for the Emperor Constantine to remain neutral or indifferent, and in order, as he thought, to effect a final settlement of the question, he convoked the memorable Council of Nicæa, or Nice (see CREEDS), in Bithynia, 325. Three hundred and eighteen bishops from almost all parts of the Christian world, but especially from the East, were present, besides numbers of priests, deacons, and acolytes. Arius boldly expounded and defended his opinions. He declared in the most unambiguous manner that the Son of God was created out of nothing; that he had not always existed; that he was not immutable or impeccable; that it was through his free-will he remained good and holy; that if he had chosen, he could as easily have sinned as not; in a word, that he was a mere creature and work of the Deity. He further affirmed that the Son of God was not of the same substance with the Father; that he was not the 'Word' or 'Wisdom,' properly speaking; and that the Scriptures only attribute these names to him as they do to other created intelligences. These propositions were listened to with great calmness by the bishops, but the inferior clergy, or at least a majority of them, manifested the most violent opposition. Alexander, Bishop of Constantinople, was ably seconded by the young deacon, Athanasius (q.v.), the equal of Arius in eloquence, and in the power of his logic. It was principally by the reasonings of Athanasius that the Council was persuaded to define, in the most precise manner, the doctrine of the Godhead—viz. the absolute unity of the divine essence, and the absolute equality of the Father and the Son (see TRINITY). All the bishops subscribed it except two, who were banished, along with Arius, to Illyricum.

An imperial edict was now issued commanding the writings of the heresiarch to be burned, and threatening with capital punishment all who should be convicted of concealing them. But at Alexandria, the Arians continued in a state of open insurrection, and began to league themselves with other condemned sects. The great influence of Eusebius was also exerted on behalf of the exiled heretic, as well as that of Constantia, the sister of the emperor, who had herself embraced Arian tenets, and in 328 permission was granted to Arius to return from Illyricum. In 330 he had an interview with the emperor; and, in the confession of faith which he presented, he declared his belief that the Son was born of the Father before all ages, and that, as the 'Word,' he had made all things both in heaven and earth. The emperor was satisfied, and sent orders to Athanasius, now Bishop of Alexandria, to receive Arius into the communion of the church. This Athanasius refused to do, and a series of tumults was the consequence. Eusebius was greatly irritated. He called a synod of bishops at Tyre, in 335, which proceeded to depose Athanasius. The emperor was even prevailed on to remove him to Gaul. In the same year, another synod met at Jerusalem, which revoked the sentence of excommunication uttered against Arius and his friends. Still the majority of the Christians of Alexandria clung to the doctrines of Athanasius. Disappointed in his expectations, Arius, in 336, proceeded to Constantinople, where he presented the emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, Bishop of Constantinople, to administer to him the holy communion on the Sunday following. Before the ceremony, however, he died so suddenly that his disciples declared that he had been poisoned, while the orthodox devoutly affirmed that God had answered the prayers of Alexander.

The manners of Arius were graceful and modest; he was noted for even an ascetic abstinence, and the purity of his moral character was never challenged by a single enemy. He is said to have composed songs for sailors, millers, and travellers, in popular measures, for the purpose of spreading his peculiar tenets; but no traces of these survive.

After his death, his followers rallied round Eusebius, now Bishop of Constantinople (338), from whom they were styled Eusebians. Constans, who ruled the West after the death of Constantine (337), and Constantius in the East, made an essay towards reconciliation; but it failed at the synod of Sardis (347), where the occidental bishops gathered themselves round Athanasius in support of the *Homousian* doctrine (identity or *sameness of substance*), while in a separate council at Philippopolis, the oriental bishops asserted the *Homoioussian* doctrine (implying merely *similarity of substance*). Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense, and pervaded almost all departments of public and private life. Constantius having gained dominion over the West, the Arian cause, which he favoured, triumphed at the synod of Arles (353) and at that of Milan (355). These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side, and was strictly maintained by the banished Athanasius and his friends, while the Antiniceans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomeans, or Heterousians, asserted, in the boldest style, their doctrine of 'distinct substances.' The semi-Arians (a large majority in the Eastern Church) maintained the Homoioussian doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the Apostate (361-3), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, so that they did not interfere with his plans. Jovianus and his followers in the West, Valentinianus I., Gratianus, and Valentinianus II., extended full toleration to both parties. Arianism at last was virtually suppressed in the Roman empire, under Theodosius in the East (379-95), and Valentinianus II. in the West. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Moeso-Gothic language, had been the means of converting the West Goths to Arian Christianity as early as 348; and they adhered to it until the synod of Toledo in 589. The East Goths, Vandals, Burgundians, the Suevi in Spain, and the Lombards also adopted Arianism; but with all the Nicene doctrine ultimately prevailed, the Lombards holding out until 662. Many of the medieval heretics were charged with unsoundness on the Person of Christ; at and after the Reformation the main representative of anti-Unitarian views was Socinus (q.v.), followed later by the Unitarians (q.v.). The two anti-Trinitarians burnt in England in 1611 were inaccurately called 'Arians.' John Milton (q.v.) was more nearly Arian; Sir Isaac Newton and Locke were probably unsound on the Trinity. Dr Samuel Clarke (q.v.) earnestly asserted opinions called semi-Arian; and Adam Clarke (q.v.) denied the 'Eternal Sonship.'

See Harnack's *History of Dogma* (trans.), Stanley's *Eastern Church* (1861), Gwatkin's *Arian Heresy* (1889); and the articles CHRIST, SOCIUS, TRINITY, UNITARIANS.

Arizona, a south-western state of the United States of America in 31° 20'-37° N. lat., 109°-114° 45' W. long., extending from Utah on the north to Mexico, and from New Mexico on the east to California and Nevada. Its western

boundary is mostly formed by the Colorado of the West, a large river remarkable for its great cañons. This river traverses the NW. part of Arizona in a deep and narrow water-worn channel (the Grand Cañon), more than 300 miles long, and nowhere less than a mile below the surface of the surrounding country. Arizona has an area of 113,800 sq. m.; it is thus nearly as large as Italy. It is in general a region of high plateaus, traversed by various mountain-ranges, presenting abundant evidence of not remote volcanic action. In the SW. the country has a desert character, and in all parts the rainfall is decidedly limited in amount. In various parts there are extensive lava-beds. The whole region lies in the drainage basin of the Colorado, though many of the smaller streams do not under ordinary conditions pay any tribute to that river, their waters being all evaporated or absorbed, except in rainy seasons. The chief affluents to the Colorado are the Gila, the Bill Williams, and the Colorado Chiquito. The main Colorado is navigable for light-draught steamboats for 600 miles, but abounds in shifting sand-bars. The rainfall is scanty, the mean annual fall at Prescott being 16.1 inches. As a result the water-supply is small, and irrigation is found necessary for any important development of agriculture. In some districts there are extensive remains of abandoned irrigation canals, where at present there is little water to be had. This indicates a larger water-supply in the past and the practice of irrigation by the ancient inhabitants. At present the basins of the Gila and the lower Colorado offer opportunities for extended irrigation, and the government is actively engaged in the construction of reservoirs, it being estimated that 10,000,000 acres may eventually be reclaimed. Greatest of these works is the huge Roosevelt dam across the Salt River Valley, 280 feet high, 1080 feet wide at top, and forming a reservoir holding sufficient water to irrigate 210,000 acres of formerly arid soil. Another method of irrigation practised in some sections is by the sinking of artesian wells, which reach an abundant subterranean supply. As a result of these efforts, agriculture has made much progress in Arizona, cereals, vegetables, and fruits being grown in all sections, the last-named including oranges, dates, figs, and other tropical fruits. There is a very extensive area adapted to grazing, and cattle and sheep are raised in large numbers. The vegetation of Arizona, though not luxuriant, comprises many trees and plants not found elsewhere in the United States. The animals are mainly those of the Rocky Mountain region. The avifauna is rich, many Mexican birds occurring here either as residents or as visiting species. The 'Gila monster' (*Heloderma horridum*) is remarkable as being the only known venomous species of lizard; and the 'horned toad' (a lizard) is very common.

Arizona is very rich in metals and minerals, especially in copper, in which it stands first among the states, its product having increased from 87,000 short tons in 1900 to about 360,000 in 1916. Silver stands next in output, its annual yield being valued at about \$5,500,000; gold follows with a value of about \$4,000,000. The precious metals are generally obtained from regular lodes, since the defective water-supply makes 'placer' and hydraulic mining for the most part unprofitable. Coal has been obtained at various points. Rock-salt, lead, and other valuable mineral deposits are reported from almost every part of the country; but many of the most profitable mining enterprises are seated in the south-eastern districts. It has been observed that the richest mines of the precious metals are on a belt crossing the state from NW. to SE. The state is traversed from east to west by two

great lines of railway, of which the Santa Fé Pacific crosses in the northern central region, and the Southern Pacific Railway in the southern part of the country. The manufacturing interests of Arizona are for the most part connected with the mines. The crushing, milling, and amalgamation of ores is an important business. Ores rich in lead, and some others, are largely smelted.

The principal towns are Tucson, an old Mexican town (pop. about 20,000); Phoenix, the capital since 1891, and a farming and mining centre (30,000); Prescott, the former capital, in a gold and silver district; Jerome and Globe, in copper districts; and Tombstone, a silver-mining centre. There are normal schools at Tempe and Flagstaff, and the university of Arizona is near Tucson. Some of the old Indian towns, or pueblos, still cherish their peculiar ways; occasionally a whole community occupies a single large stone-built house several stories high.

This region was first visited by Spaniards in 1570, and their military post at Tucson was established in 1580. Considerable numbers of the Indians were Christianised and partly civilised by Spanish missionaries; but many of the half-civilised pueblo Indians have persistently refused to become Christians. The warlike Apaches and other wild native tribes for 300 years have given much trouble, and it was not till 1886 that the United States forces and the Mexican troops, acting conjointly in the frontier districts, gave the Apaches such a severe punishment, that their power to annoy the white settlers would appear to be for ever destroyed. Indian hostilities from the first greatly interfered with the development of the region. After 1821 the country was a part of Mexico until 1848, when it passed to the United States, which in 1853 effected further the 'Gadsden Purchase' (see GADSDEN). The territory was organised in 1863; a scheme for uniting it and New Mexico as the state of Arizona was defeated in the Senate (1906), but it was admitted to the Union as a separate state in 1910. Pop. (1870) 9658, and tribal Indians; (1900) 122,931; (1920) 334,162.

Ark. See DELUGE.

Ark of the Covenant, **ARK OF THE TESTIMONY**, or **ARK OF JEHOVAH**, is mentioned no less than 200 times in the Old Testament, and has at least twenty-two different designations. It was an oblong box of acacia-wood, overlaid with gold within and without, two cubits and a half (3 ft. 9 in.) in length, one cubit and a half (2 ft. 3 in.) in breadth and height, in which was deposited the 'testimony,' the law of the ten commandments inscribed on two stone tablets. (In Hebrews, ix. 4, mention is also made of the pot of manna and Aaron's rod.) The lid of the *mercy-seat* was of gold, and had at each end a *cherub*, between which was the place of the *Shechinah* or visible manifestation 'symbolical of the Divine presence. Rings were fastened to the ark, through which were inserted the staves by which it was carried, after being covered with a curtain of badgers' skins, with a blue cloth over all. Alike in the tabernacle and in the temple it was put into the 'most holy place,' into which, on the 'day of atonement,' the high-priest was to enter alone. The desire of the Israelites to have the ark in the army, and its solemn conveyance to the new capital in David's time, have been interpreted as revealing a somewhat sensuous conception of Jehovah as actually having his residence within it. This is but little in harmony with the spiritual idea of Jehovah found in the prophets, and it is significant that the ark is only once alluded to by them, and that in a very peculiar manner (Jer. iii. 16). The ark and the *mercy-seat* have long held an important place in

the orthodox interpretation of Old Testament typology.

Professor Sayce pointed out a close parallel in the Babylonian *papakhhu* borne on men's shoulders in procession at festivals. These 'arks' filled an important place in the Babylonian ritual. They had all special names, and were the visible abodes of the gods to which they belonged. Parallels have also been found in Egypt, where, as Cheyne says, 'no festal processions could be sculptured or painted without them. The arks with their images were placed on boats which were ornamented at the ends with heads of the divinities within.' Ark-shrines are also characteristic of the Japanese religions.

See appendix in A. R. S. Kennedy's Century Bible edition of 1 and 2 Samuel.

Arkansas, formerly pronounced *Ar'kansaw* and popularly known as 'the Bear State,' is one of the states of the American Union, and is bounded N. by Missouri, E. by Missouri, Tennessee, and Mississippi, S. by Louisiana, and W. by Texas and Oklahoma State. Area 53,850 sq. m.—about that of England without Wales—of which some 800 sq. m. is water-surface. The southern limit is the parallel of 33° N. lat., and the northern boundary for the most part is on the parallel of 36° 30'. The Mississippi River washes nearly all the eastern border of the state. The extreme east and west limits are respectively 89° 40' and 94° 42' W. long. Nearly all the country is well timbered. Along the eastern border of the state, for more than half its extent from the north, lies a strip of rich alluvial and swampy land, 60 miles in average breadth, and limited westward by Crowley's Ridge, a prominent feature of the country. A similar low and wet tract is traversed by the lower Arkansas River. The southern half of the state contains great areas of yellow and loamy land of Tertiary age, interspersed thinly with tracts of red clays and hills of iron-ore. West of the Crowley's Ridge region is a considerable breadth of gray silty prairies. In the west of the yellow Tertiary loams are large patches of 'black prairie' of Cretaceous age. The west and central portions of the state form a broken hill-region of Tertiary origin. Great prairies of red loam and clay soil prevail in the W. and NW. Towards the north is the Ozark mountain-region, a broken country of high hills and ridges. The soils, though of extremely various character, are mostly good throughout the state. The coal-measures very extensively underlie the surface, and coal crops out at many points; but thus far it has not been much wrought. The quality of the Arkansas coal is reported to be excellent. Silver-bearing galena and zinc appear to be abundant, and iron-ores exist in vast amounts. The villages of Hot Springs in Garland county, and Eureka Springs in the NW. are celebrated health-resorts. The novaculite, or hone-stone, of this state is extensively wrought and exported. The Mississippi, Arkansas, Red, White, St Francis, Ouachita, and other navigable rivers afford excellent facilities for the cheap transportation of goods. In the eastern alluvial region, especially towards the north, occur several large but shallow lakes, which were formed during the great earthquakes of 1811.

Agriculture is the leading pursuit in Arkansas, and cotton is the great staple of production. Maize is also very largely produced, and considerable quantities of oats and wheat are harvested. Livestock, wool, tobacco, pork, and dairy products are marketed, and their production is receiving a rapid extension. Much attention is also given to fruit culture, and the state is famous for apples.

The development of the railway system of the state has given far greater variety and enterprise to the agriculture of Arkansas than it had

under the old system of slave labour, when cotton, maize, and pork were almost the sole articles of production. Arkansas is still one of the leading states in cotton production, and it has been asserted that if the cotton-lands were worked to anything near their full capacity this state might furnish as much of this staple as is now raised in the whole United States. There are still large areas of undeveloped government land, and excellent improved lands can be purchased at low rates. Although malarial fevers and severe heat are to be encountered in the marshy and flat alluvial districts, the larger portion of the country has an agreeable and healthful climate, and few parts of the republic offer greater natural attractions to the immigrant. At Washington, in the NW. of the state, the mean annual temperature is over 61°, and the annual rainfall 54.5 inches; at Fort Smith, in the W., the rainfall is 40.36 inches. The extensive forests of Arkansas have become a source of wealth. Hard woods prevail north of the Arkansas River, cypress swamps cover a great part of the eastern alluvial districts, and in the south there are extensive areas covered with pine. In quality, variety, and accessibility, the timber of this state is hardly surpassed. Great attention has been given to the black walnut timber of Arkansas, which is extensively used by cabinetmakers. Shingles, staves, and rough lumber are largely shipped. The manufacturing interests of this state (apart from the sawing of lumber and kindred operations) are for the most part little developed. Valuable water-power exists in the hilly and mountainous districts, but it is thus far not extensively utilised. Mills for the extraction of cotton-seed oil find profitable employment. The mineral resources of the state are believed to be very large, but they have been but little utilised. Lying outside the great currents of immigration, Arkansas, until very recent years, preserved to a remarkable degree the character of a frontier country. Even the large extent of river navigation for a long time served to hinder the development of the country, since it discouraged the construction of railways, and as a consequence, great tracts of excellent land lying at a distance from the large streams are even now very thinly peopled. The old system of slave labour and of large holdings of land was not favourable to rapid material development. This region formed a part of the French colony of Louisiana, and was purchased, together with the rest of that colony, by the United States in 1803. The earliest French settlement was made at Arkansas Post in 1685. Arkansas was organised as a territory in 1819, and became a state in 1836. An ordinance of secession was passed by a state convention in 1861, and during the war which followed, this state was the scene of several active campaigns.

Public education has in recent years received much attention. Much care has been bestowed in some sections on the education of the freedmen and their children. Since 1880 there has been a large movement of coloured immigrants from the older states. The light, yet fertile soil, and the warm climate of Southern Arkansas, seem specially attractive to this class of settlers, and the movement has been greatly encouraged by the planters of that section. The white population is almost entirely composed of English-speaking people of American birth.

The principal cities are Little Rock, the state capital (pop. 65,000); Fort Smith, 30,000; Pine Bluff, 20,000; North Little Rock (formerly called Argenta); Hot Springs; and Helena. (Arkansas City is in the state of Kansas.) Population of Arkansas (1820) 14,255; (1850) 209,697; (1860) 435,450; (1880) 802,525; (1890) 1,128,179; (1900)

1,311,564; (1910) 1,574,449; (1920) 1,752,204, of whom 279,757 were of white race.

Arkansas River, next to the Missouri the largest affluent of the Mississippi. It is 1514 miles long, rising in the Rocky Mountains, at an altitude of 10,000 feet, on the borders of Utah, and joining the 'Father of Waters' at Napoleon, 275 miles above New Orleans. Flowing generally through a level country, it presents but few obstacles to navigation. The principal difficulty is connected with its periodical rise and fall—the difference between season and season being not less than 25 feet. It varies in width from 150 feet near the mountains, to about a mile in the sandy regions, and is practicable for steamboats, during nine months of the year, to a distance of 800 miles from its mouth. It divides the state which takes its name into nearly equal parts. Its most important tributary is the Canadian River.

Arklow, a seaport of Wicklow, 49 miles S. of Dublin, at the mouth of the lovely Avoca, which is crossed here by a bridge of nineteen arches. Near it is Shelton Abbey, the seat of the Earl of Wicklow. There are ruins of the castle of the Ormonds, destroyed by Cromwell in 1649, and traces of an ancient monastery. In 1798, a bloody encounter took place here between the government troops and the United Irishmen. Arklow (pop. 5000) is the chief fishery port in Ireland.

Arko'na, the N.E. promontory of the island of Rugen, in the Baltic. Its chalk-cliffs rise to a height of 177 feet, topped with a lighthouse, built in 1827, itself 78 feet high, from which the Danish island of Moen, 33 miles N.W., can be seen. Here stood the famous fortification (Slav. *Urkan*) so long impregnable, and the temple of the Wend deity Swantewit, the most sacred sanctuary of the Slavs of Northern Germany. It was destroyed, after a long struggle, by King Waldemar I. of Denmark in 1168. The remains of the *burg-ring* or wall still stand on the land side of the promontory.

Arkwright, SIR RICHARD, celebrated for his inventions in cotton-spinning, was born at Preston, in Lancashire, December 23, 1732. Of humble origin, the youngest of thirteen children, he was bred to the trade of a barber, and his early opportunities of cultivation were exceedingly limited. About 1750 he settled as a barber in Bolton, and for several years became also a dealer in hair. A secret process for dyeing hair, said to have been discovered by himself, increased considerably the profits of his trade. Very little is known regarding the first movements of his mind in the direction of mechanical invention. His residence in the midst of a cotton-spinning population naturally led him to take an interest in the processes used in that manufacture. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in the construction of his apparatus. About 1767 he seems to have given himself wholly up to inventions in cotton-spinning. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair moving slowly in contact, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. No previously invented machinery had been able to produce cotton-thread of sufficient tenacity and strength to be used as warp. An invention, indeed, by Mr Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives Arkwright of the honour of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said,

was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time Arkwright was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a Burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Mr Jedidiah Strutt of Derby, the celebrated improver of the *stocking-frame*, who, in conjunction with his partner Mr Need, entered into partnership with Arkwright.

In 1769 Arkwright set up his first mill, driven by horses, and took out a patent for his invention. In 1771 he set up a larger factory, with water-power, at Cromford, in Derbyshire. In organising his business, Arkwright showed remarkable energy and capacity; and he may be regarded as the founder of the factory system. In 1775 he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs, that he was obliged, in 1781, to prosecute at once nine different manufacturers. The first action, against Colonel Mordaunt backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, Arkwright published a pamphlet containing a statement of his case. In a new trial in 1785, he obtained a favourable verdict. The whole question, however, was brought finally before the Court of Queen's Bench, a few months after, when Arkwright's claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of Arkwright's old assistant Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out Arkwright as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited against him on the ground that his mechanical improvements diminished the demand for labour; and on one occasion, a large factory belonging to Arkwright was destroyed in the presence of a powerful military and police force, without a word of interference from the magistrates. Arkwright, however, triumphed over all opposition. In 1790 he introduced the steam-engine into his works at Nottingham; and at the time of his death in 1792, the value of his property amounted to about half a million sterling. In 1786, on the occasion of presenting an address to the king, congratulating him on his escape from the knife of the maniac Margaret Nicholson, he was knighted. In 1787 he was appointed high-sheriff of Derbyshire. A severe asthma had pressed upon him from his youth; and a complication of disorders, the result of his busy sedentary life, terminated a remarkable career at the comparatively early age of sixty, on the 3d of August 1792.

Arlberg is the name of a crystalline mountain mass amongst the Eastern Alps, which forms the boundary between the Austrian lands of Tyrol and Vorarlberg ('the land before or beyond the Arlberg'). The pass over this ridge, that on the route from Bludenz to Landeck and Innsbruck, is 5300 feet high, and is one of the most difficult in the Tyrolean Alps, though it is practically the

only one between the two Austrian lands. The scheme for a railway with a tunnel through the Arlberg Alp took definite shape in 1880, and the railway from Innsbruck to Bludenz was opened 15th November 1884. The railway is through a singularly beautiful mountain country, and is much frequented by tourists to and from Italy. The main tunnel is 6720 yards in length, and cost £1,500,000.

Arles, one of the oldest towns in France, in the department of Bouches du Rhône, situated on the left bank of the principal branch of the Rhone, 15 miles from the sea, and 53 miles NW. of Marseilles by rail. It is famous for its Roman remains, including baths, a palace of Constantine, an aqueduct, a huge amphitheatre (460 feet by 340 feet) capable of accommodating 25,000 spectators, and a theatre (where a fine statue of Venus was unearthed). The early Christian cemetery of Aliscamps or Alyscans contains sarcophagi. The cathedral of St Trophime (with fine portal and cloisters) dates from the 7th century; the museum has many Christian antiquities. Mistral founded a Provençal museum here. Arlesian women, who wear a picturesque costume of their own, are famed for their classical beauty. Canals connect Arles with the harbour of Bouc and with Marseilles. Arelate or Arelas under the Romans was the seat of a prefect; afterwards, for some time, the residence of the Gothic king, Eurich; and in 879 the metropolis of the kingdom of Arelate (see **BURGUNDY**). It was a free city in the 12th century. In the early Christian times several important synods were convened here (314, 354, 452, 475 A.D.). Pop. 31,000.

Arles, a term used in Scotland and the north of England for a piece of earnest-money given in confirmation of a bargain or engagement, especially when a servant is hired. The ultimate origin of the word is the Latin *arraha*, 'earnest-money,' 'part of the price paid down.'

Arlington, **HENRY BENNET**, EARL OF, was born at Arlington, Middlesex, in 1618, and from Westminster School proceeded to Christ Church, Oxford. During the civil war, at Andover he got a lifelong scar on the nose; afterwards at Madrid, as Charles's agent, he acquired an equally lasting pomposity. The Restoration brought him back to England. Created Lord Arlington in 1663, and Earl of Arlington in 1672, he was not the most scrupulous member of the unscrupulous Cabal (q.v.). In 1674 he was impeached as a promoter of popery, a self-aggrandiser, and a betrayer of trust—in brief, as the 'conduit-pipe' of Charles's evil policy. The impeachment fell through; but Arlington found it desirable to exchange the office of secretary of state for that of lord chamberlain, and finally he retired to his Suffolk seat, Euston, where he died, 28th July 1685.

Arion (anc. *Orolanum*), a town of Belgium, the capital of the province of Luxembourg, 27 miles WNW. of Luxemburg by rail. It is a neat and prosperous town, and has a considerable trade in corn, iron-ware, tobacco, crockery, and clay-pipes. The town is mentioned as early as 870; the nunnery of Clairefontaine, in the neighbourhood, is now a foudry. Pop. 12,000.

Arm. The upper extremity of the human body may be divided into three portions—viz. the shoulder, the hand, and the intermediate shaft or arm. The latter consists of an upper arm and a forearm. In the upper arm there is one bone, the humerus, *h* (fig. 1). This bone presents a globular head, which articulates with and moves freely upon the scapula, *s*, forming the shoulder-joint. At the junction of the head and shaft of the humerus, there is a constriction termed the anatomical neck.

The shaft is cylindrical in its upper part, but becomes flattened and somewhat three-sided below. A short distance above its lower end, and on the inner side, a hooked process pointing downwards is very occasionally found. This represents a process of bone forming a complete foramen in carnivorous animals, through which the main artery and nerve of the limb run. At the lower end of the shaft two articular surfaces for the bones of the forearm are found; the outer, rounded for the head of the radius, *r*; the inner, a pulley or trochlea for

Fig. 1.—Bones of the Human Arm:

h, humerus; *r*, radius; *u*, ulna; *w*, wrist-joint; *hd*, hand; *s*, scapula; *c*, clavicle, or collar bone.

Fig. 2.—Muscles of the Human Arm:

abd, deltoid muscle; *d*, coracobrachialis muscle; *t*, *r*, triceps; *e*, *i*, extensors of wrist and long supinator of the hand; *km*, flexor of fingers and radial and ulnar sides of the wrist, and *l*, palm of the hand, or palmaris longus; *p*, palmaris brevis; *q*, palmar fascia; *o*, biceps.

the movements of the ulna, *u*. The bones of the forearm are two in number, the radius and ulna; the former being placed upon the outer, the latter upon the inner aspect of the forearm. By their upper ends, these bones articulate with the humerus, to form the elbow-joint; by their lower ends, with the carpus, to form the wrist-joint, *w*.

The shoulder-joint is constructed upon the plan of a ball and socket, the bones being held in position by a capsular ligament which is very loose, thereby allowing freedom of movement to a greater extent than in any other joint in the body. This gain in mobility occasions a loss of stability; hence dislocations are frequent. For the most part, the head of the humerus is driven downwards into the armpit, this being the only side of the joint unsupported by muscles passing to be inserted into the upper end of the shaft. See **SHOULDER**.

A large triangular muscle, the *deltoid*, raises the arm from the side—a movement distinctively human; it is depressed by the *coraco brachialis*, the *latissimus dorsi* (the great muscle of the back), and the *pectoralis major* (the great muscle of the chest); in addition, it can be carried forwards and backwards by the action of these muscles.

Circumduction is the result of a combination of these movements.

The elbow-joint is hinge-like or ginglymoid. It is provided with strong lateral ligaments, and its movements are extension or straightening of the forearm produced by the *triceps*; flexion or bending by the *biceps*, *brachialis anticus*, and *supinator longus*. During the latter movement, the twist upon the trochlear surface at the lower end of the humerus causes the hand to be carried inwards in the direction of the mouth.

Joints called radio-ulnar are found between the bones of the forearm at their upper and lower extremities. The movements at these joints affect the hand, for it articulates with the lower end of the radius to which they are principally due. When the radius rolls forward upon the ulna, the palm of the hand is turned downwards—*pronation*; when it rolls backwards, the palm is turned upwards—*supination*. Each movement is produced by two muscles, which take their fixed points from the humerus and ulna.

A variety of the hinge-joint is found between the radius and carpus, for, in addition to flexion and extension, the hand can be drawn to the radial or ulnar borders of the forearm. These movements are effected by the *palmaris longus*, the flexors and extensors of the radial and ulnar sides of the wrist.

The upper extremity is supplied with blood by the continuation of the axillary trunk, the brachial artery, and its branches. The veins collect into large superficial trunks, which unite at the bend of the elbow, at which situation one is frequently selected for venesection, and then pass on to join the axillary, on the outer side by the cephalic vein, on the inner side by the basilic. The axillary vein is formed by the junction of superficial vessels just mentioned with the deeper companion veins which accompany each branch of the brachial artery.

The nerves pass down as large cords by the side of the artery, and diverge from it to their ultimate distributions; the musculo-spiral soon passing round the back of the upper arm to appear on the outer side, and become the radial and posterior interosseous nerves; the ulnar running behind the internal condyle of the humerus, for which it has obtained the term 'funny bone,' from the electric-like thrill which passes along the arm when the nerve is struck or pressed. The median, as its name implies, keeps a middle course with the artery. See NERVOUS SYSTEM.

The arm affords excellent illustrations of some of the principles of mechanics. The insertion of the muscles so near, as will be seen, to the fulcra or centres of motion, involves a loss of power in the usual sense of the word; there is, however, a corresponding gain in velocity at the end of the lever; and for most of the purposes to which the hand is put, agility is of far greater moment than dead strength. See LEVER.

As far back as 1795, attention was first directed by White to the proportion between arm and forearm. Subsequent measurements have shown that a long humerus, and a still longer radius, are essentially ape-like characters, while the very reverse is typical of man, in whom the radius is shorter than the humerus. In anthropoid apes, the arm, from shoulder to wrist, is therefore longer than in man.

Extending the investigation to the different races of mankind, we find that there is very little divergence, except in the case of the African negro and Australian aboriginal, in whom the forearm is longer than in the white races. Notwithstanding this approximation to the anthropoid type, the arm of the negro, from shoulder to wrist, is a little shorter than that of the European. The explanation of this anomaly is found in the fact that the

humerus of the negro is shorter than that of the European, and thus two inferior characters—a short humerus and a long radius—have combined to produce a superior one—a short arm. This affords an illustration of the fact that the proportions between human and anthropoid skeletons may approximate at one point while they diverge at another, even in the same type.

Arma'da, a Spanish word signifying simply an armed force, but applied specially to the great Spanish fleet fitted out against England in 1588. The king of Spain, Philip II., had resolved to strike a decisive blow at Protestantism by conquering England, which Pope Sixtus V. had formally made over to him. The ports of Spain, Portugal, and other maritime dominions belonging to him, had long resounded with the noise of his preparations, and the most eminent Catholic soldiers from all parts of Europe flocked to take a share in the expedition. The Marquis of Santa-Cruz, an admiral of reputation and experience, received the command of the fleet, and the famous Duke of Parma of the land-forces. The latter had already gathered 30,000 men in Flanders, and merely waited the arrival of the armada to protect his crossing. As no doubt was entertained of success, the fleet was ostentatiously styled the Invincible Armada. When ready for sea, it consisted of 129 vessels, 65 of which were over 700 tons, and was manned by 8000 sailors, while it carried 19,000 Castilian and Portuguese soldiers, over 2000 cannon, and provisions sufficient to feed 40,000 men for six months. A squadron of 80 ships, only 30 of which were ships of the line, was all that Elizabeth had to oppose it by sea; but although the English fleet was much inferior in number and size of shipping to that of the enemy, it was much more manageable, while it was manned by 9000 of the hardiest seamen in Europe. Lord Howard of Effingham (q.v., usually but doubtfully said to have been a Catholic) took upon him as lord high admiral the command of the fleet; Drake, Hawkins, and Frobisher served under him; while a few ships, under Lord Seymour, lay off Dunkirk, to watch the Duke of Parma. Such was the preparation made by the English; while all the Protestants of Europe regarded this enterprise as the critical event which was to decide for ever the fate of their religion. Drake's daring attack on the store-ships in the harbour of Cadiz had already delayed the expedition, and it was further delayed at the moment of sailing by the death of the admiral Santa-Cruz. Scarcely had it actually sailed under command of the Duke of Medina Sidonia, a seaman of but little experience, when a gale in the Bay of Biscay drove it for shelter into Ferrol. Some time was lost in refitting, and it was not till the end of July that the sails of the fleet were seen from Lizard Point, and the English beacons had flared their alarm all along the coast. The armada was disposed in the form of a half-moon, stretching seven miles from the one horn to the other. The Spanish admiral, instead of going to the coast of Flanders to take in the troops stationed there, resolved to sail directly to Plymouth, and destroy the shipping in the harbour. But Howard slipped out of Plymouth Sound, and hung with the wind upon his rear. He refused to come to close quarters, but attacked the Spaniards at a distance, pouring in his broadsides with admirable dexterity, and escaping at will in his swift and easily handled vessels out of the range of the Spanish shot. Galleon after galleon was sunk, boarded, or driven on shore, and 'the feathers of the Spaniard were plucked one by one.' As the armada advanced up the Channel, the English still followed and harassed its rear, and the running fire continued throughout the week, until the Spaniards took shelter in the

port of Calais. At midnight Howard sent eight of his smaller vessels, filled like fireships with combustible materials, and ablaze, into the midst of the enemy. The Spaniards in panic cut their cables and stood out to sea, while the English ships pursued closely, and came up with them at dawn off Gravelines. Broadside after broadside the English poured into the towering ships of the armada, which in their turn were unable to do any great damage to them. At the close of six hours' furious fighting they found their best ships shattered to pieces and drifting with a north-west wind upon the sandbanks of Holland. More than 4000 men had fallen, while on the English side not a hundred men had been killed, and not a ship had been taken. The Spanish admiral in despair called a hasty council of war, in which it was resolved that, as their ammunition had begun to fail, as their fleet had received great damage, and as the Duke of Parma had refused to venture his army under their protection, they should return to Spain by sailing round the Orkneys, the winds being contrary to their passage directly back. The English ships were soon compelled to fall back from want of ammunition, with which they had been but stingily supplied through the ill-timed cheese-paring policy of the queen; but the storms of the northern seas broke upon the armada, and finished the work of destruction. When Howard fell back from the pursuit, on the 13th of August, there were still 100 vessels in the Spanish fleet; fifty-four only, and these in miserable condition, their crews dying of sickness and exhaustion, ever reached the ports of Spain. The rocks of the Hebrides and the western coast of Ireland were not more fatal to the ships than the hungry Islemen and Irish to their hapless crews. The seamen, as well as the soldiers who survived, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate valour of the English, and of the tempestuous violence of that ocean by which they were surrounded.

The story has been told by Froude in his *History* and in *The Spanish Story of the Armada* (1892), by Kingsley in *Westward Ho!* by Sir J. K. Laughton in *The Defeat of the Spanish Armada* (1894), and by J. R. Hale in *The Great Armada* (1913). Macaulay's spirited ballad is well known.

Armadillo (*Dasypus*), a genus of mammals in the order Edentata (q.v.). They are not, however, toothless, as the word Edentate would suggest, but provided with a variable number of simple molars, destitute of true roots, and distant from one another, so that those of upper and lower jaw interlock when the mouth is shut. Only in one case are there teeth which are not molars. The elongated snout bears at its tip the downward directed nostrils. The tongue is smooth, slender, and glutinous, but not long and extensible like that of the ant-eaters. The eyes are small and weak, probably in association with the burrowing habits of the animals, but the senses of smell and hearing are acute. The limbs are short and strong, and bear powerful claws, much used in burrowing. This they do very rapidly when in danger, while some, such as *D. apar*, protect themselves by rolling up into a ball and exposing only the armoured dorsal surface. This bony armour is indeed their most striking peculiarity, which distinguishes the genus from all other mammals except the allied *Chlamyphorus*. It consists of shields on head, neck, shoulders, and rump, and of movable cross bands of plates across the back. Even the tail may be thus armoured. In this way some of the armadillos have retained their foothold in the struggle with higher animals. Naturally timid and passive, they can, if forced, use their powerful claws in self-defence. They are

nocturnal in habit, and feed on insects, worms, fruits, roots, and sometimes on carrion. They are distributed from Mexico and Texas southwards to Patagonia, and occur in immense numbers in the

Three-banded Armadillo (*Dasypus apar*).

woods and pampas. The largest of the numerous species (*D. gigas*) is fully 3 feet long, exclusive of the tail, which measures a foot and a half more, while the smallest is not above 10 inches in length. Though all are eaten, the flesh of the more vegetarian species is particularly esteemed. Nearly allied is the small hairy *Chlamyphorus*, which has no shields, but a loose leathery armour formed of 24 cross bands of plates. In the pleistocene strata of South America, the armadillos are represented by giant fossil forms. See GLYPTODON.

Armadillo. See WOOD-LOUSE.

Armageddon, the great battlefield of the Apocalypse, in which the final struggle between the powers of good and evil is to be fought. Its name was undoubtedly suggested by that famous battlefield, Megiddo (Judges, v. 19), in the plain of Esdraelon, on which some of the most important battles in the history of Israel were fought, as the victories of Barak over the Canaanites, and Midian over the Gibeonites, as well as the defeat of Saul by the Philistines, and of Josiah by the Egyptians.

Armagh', the capital of County Armagh, 33 miles SW. of Belfast, is situated around and on a gentle eminence, whence its original name, Ard-Magha, 'the high field.' It is well built of limestone. The cruciform cathedral (184 by 119 feet), dating from the 12th century, is built of red sandstone, and is supposed to occupy the site of that erected by St Patrick in the 5th century. A Gothic Roman Catholic cathedral occupies the principal height to the north, and the primate's palace that to the south. There are a college, a celebrated observatory, a county court-house, prison, public library (founded in 1771), fever hospital, district lunatic asylum, infirmary, and barracks. It is the seat of the archiepiscopal see of the Primate and Metropolitan of all Ireland. Armagh or Emain Macha was from 495 to the 9th century the ecclesiastical metropolis of Ireland, though it is doubted whether St Patrick founded it, and it was renowned as a school of theology and literature. Yet it was repeatedly sacked and plundered in native wars (as by Fedlimidh, king and bishop of Cashel in the 8th century) even before the Danish invasions. After the Reformation, it suffered severely in the conflicts between the English and Irish; it contained only three slated houses in 1765. Under the Redistribution of Seats Act (1885), Armagh ceased to be a parliamentary borough. Pop. (1881) 10,070; (1901) 7570; (1911) 7356.

Armagh, a small inland county in Ulster, Ireland; bounded N. by Lough Neagh, E. by Down, S. by Louth, W. by Monaghan and Tyrone. Its greatest length is 32 miles, and breadth 20. Area, 512½ sq. m.; about one-half is under tillage, and the remainder in pasture, plantations, and bog, hill, and under water. The surface is hilly in the SW., and undulating in the centre, attaining in Slieve Gullion, in the SW., the height of 1893 feet. The country bordering upon Lough Neagh is low and boggy, and the Louth plain extends into the south end of Armagh. The principal rivers, navigable in their lower parts, are the Callan, the Tynan, the Upper Bann, flowing out of Down NW. for 11 miles before it enters Lough Neagh, and the Blackwater, which in its lower part separates Armagh from Monaghan. The rocks of Armagh are—Lower Silurian in the south and middle of the county; the trap of Antrim, with the underlying greensand, around Portadown; carboniferous limestone in the basins of the Blackwater and Callan; granite in the mountains of the SE.; and Tertiary strata bordering Lough Neagh. The soil is fertile, with a good deal of bog. The chief crops are oats, potatoes, wheat, turnips, and flax. The north and central parts of Armagh exhibit a dense population, low hills cultivated to the tops, hedgerows, orchards, and thickly scattered farmsteadings. Besides agriculture, linen and cotton weaving are the chief industries. Apples are largely grown. The county is mostly in the diocese of Armagh. It returns three members of parliament. The chief towns are Armagh, Lurgan, and Portadown. Pop. (1841) 233,024; (1871) 179,260; (1881) 163,177; (1911) 120,291, of whom 45 per cent. were Roman Catholics, 32 per cent. Episcopalians, and the remainder chiefly Presbyterians.

Armagnac, the old name of a district in the south of France, a part of Gascony now mostly included in the department of Gers. The soil is fertile, and its wine and brandy (*Eau d'Armagnac*) are well known. The inhabitants are noted for their simplicity, strength, and bravery; but are credulous and ignorant. The name *Armagnacs* was borne by a band of soldiers who did good service in the early history of France against the English and Swiss. The family of the Counts of Armagnac, which ended in 1497, played an important part in French history.

Armatoles, the warlike inhabitants, since the 15th century, of the mountain districts in Northern Greece, especially in Macedonia, Epirus, and Thessaly. At one time, as robbers, they ravaged the neighbouring country, at another time protected its wretched inhabitants from other robbers in consideration of black-mail. The Turkish pashas, unable to subdue them, made terms with them, and tried to metamorphose them into a sort of military police, intrusting to their care the safety of the public roads, and dividing the country into districts, each under the supervision of a chief of these militia. But although the Armatoles frequently suppressed the brigandage of the Klephts, they still regarded them as brothers of common origin and faith, and shared with them their hatred for the Turkish yoke, however nominal it might be. The Turks at last alarmed at this sympathy, tried to substitute for the Armatoles the Mohammedan Albanians, who were the implacable enemies of the Greeks. The moment the Greek insurrection broke out, in 1820, the Armatoles joined the insurgents 12,000 strong, and they at least gained some glory in the war.

Armature is the term applied to the pieces of soft iron that are placed at the extremities or poles of magnets to preserve their magnetic power. See **MAGNETISM**; also **DYNAMO-ELECTRIC MACHINES**.

Armenia, a high tableland in the upper valleys of the Euphrates, Tigris, Aras, and Kur, 400 to 500 miles long, by nearly the same in breadth. In ancient times an independent country, it repeatedly recovered its independence down to the middle ages, although with varying boundary, as it did again in 1918. Before that date the north-east belonged to Russia, the south-west to Turkey; the south-east still belongs to Persia. The republic has an area, within the 1920 boundary, of some 80,000 square miles; but at widest Armenia extends to the Caspian and the Caucasus (140,000 square miles). Extreme Armenian claims include Cilicia. The interior consists mostly of pastoral plateaus, 2700 to 7000 feet above sea-level, crowned by conical heights or traversed by mountain-chains. Beside Mount Aiarat the three empires met. A chain of mountains, stretching from Aiarat to the confluence of the two head-waters of the Euphrates, divides Armenia into a northern part, containing the plateaus of Bayazid, Erzerum, Kars, and Erivan; and a southern, in which lies the plain of Muad Su, 4650 feet high at Mush. On the plateau of Erivan, the principal cones are Little Aiarat, 12,840 feet high; Great Aiarat, 17,000 feet; and Ala Goz (with three pinnacles), 13,436 feet. Surrounding Lake Van is the chain of the Ala Dagh, rising in Tura Jelu to 13,720 feet. The Kara Bagh plateau (in Persia) reaches 11,000 feet. The mountain-system of Armenia is mostly volcanic, in which trachyte and augite porphyry are mainly represented. The numerous cones are for the most part old craters. The volcanic nature of Armenia is still testified by its hot mineral springs, and by its earthquakes, which in 1840 destroyed a village on Aiarat, and in 1859 the town of Erzerum. The Murad Su or East, and the Kara Su or West, Euphrates form the head-waters of the Euphrates; whilst head-waters of the Tigris flow from the confines of Armenia and Kurdistan. Other rivers are the Aras or Araxes, the Kur, and the Tchhorak. Of lakes, there are Van and Goktcha or Sevan in the republic, and Urmia in Persian Armenia. Armenia is rich in metals, possessing mines of silver, lead, iron, arsenic, alum, rock-salt, and especially copper.

The geographical area is divided into a subtropical region of rains, embracing the valley of the Upper Tigris; a region of perpetual snow, which, in Ararat, except on the NW. side, starts as high as 14,000 feet, but elsewhere descends some 3000 feet lower; and an intermediate region of very various grades, including the plateau of the frontier mountains and the plateau chains, to a height of 12,000 to 13,000 feet. This third zone ranges from a South-European to a Mid-European climate, with harvest as late sometimes as August and September. The plateaus—volcanic, dry, and singularly bare of wood—have a very severe climate; the winters long and inclement; the summers short, very hot during the day, but always cold at night. The cold north winds, against which Armenia has no protection, encountering the east and south winds, give rise to the storms that render the navigation of the Black Sea coast so dangerous. Much the richest belt of vegetation is the broad valley of the Aras; but the marshes produced by the many irrigating channels make this the most unhealthy part of Armenia. There are, nevertheless, rich vineyards and orchards, fields of cotton, tobacco, rice, hemp, and flax. The high tablelands are chiefly pastoral, though a little corn is also cultivated.

The ancients distinguished *Armenia Major*, the larger and eastern half, bordering on Media and the Caspian Sea, on Mesopotamia and Assyria, from *Armenia Minor*, to the west of the Euphrates. Turkish Armenia comprised parts of the vilayets of Trebizond, Erzerum, Bitlis, and Van. Russian Armenia,

earlier Persian and Turkish, included the governments of Erivan and Kars, as also part of the government of Elizabetpol. In what was Russian territory are situated the three old monasteries, Etchmiadzin, seat of the patriarch of Armenia, Haghpad, and Sanahine. The boundaries of the republics of Armenia, Georgia, and Azerbaijan are in dispute. Persia holds the province of Azerbaijan (adjacent to the republic of the same name), which was included in the former Russian sphere of influence and is connected by rail with Tiflis.

The Armenian is rather above middle stature, of darkish-brown or yellow complexion, with black, straight hair, large nose, wide rather than high forehead. He is of quick, adaptive intelligence, and specially qualified for trade. The women are often handsome, with erect carriage, regular features, and fine dark eyes. Only a part of the Armenians live in Armenia, most of them having been long dispersed all over the world. Yet is their essential national cohesion and indissolubility of national character almost as strong as is that of the Jews, though it has not had such unemitting fires of persecution to anneal it. They belong to the Iranian group of the Indo-Germanic family. The Armenians at the present day are to be found in almost all parts of Asia Minor; in Russia, Persia, and India; in the great commercial cities of the Mediterranean; in Hungary and Galicia; in London, and other chief cities of Europe and of America, occupying posts as money-changers, bankers, and merchants, though also as artisans and porters. Their number in Armenia itself has been estimated at over 1,000,000; in Persia and adjacent territories, 150,000; in Russia, 1,000,000; in Asia Minor (outside Armenia) and the Balkan Peninsula, over 500,000; in India, Africa, Europe (Hungary and Galicia), more than 250,000; in America, about 100,000. There are Armenian communities in Petrograd, Moscow, London, Manchester, Amsterdam, Marseilles, &c. At Venice are the Meclitists (q.v.). Tiflis and Constantinople have more Armenians than any other town in or out of Armenia. In what was Turkish Armenia Kurds predominate. Among the foreign invaders implanted in Armenia are the Turks, mostly engaged in agriculture; the nomadic Kurds; in the SE. the Tatars; Nestorians occupying the mountains of the Persian frontier, and speaking a Syriac dialect; Georgians in the north. Greeks, Jews, and gipsies are also scattered throughout Armenia. The Armenians themselves are at home mostly shepherds and tillers of the soil, living in low mud-built cottages or underground dwellings, very meagrely furnished. The houses are built at the side of or round a small courtyard, the rooms with no apertures for light except into the yard. The cattle sometimes house with the family. In summer the roof is utilised for smoking, eating, and sleeping. Armenian women are not secluded like Moslem women. By decree of the Catholikos they received the right to vote in elections. The women, seldom the men, weave carpets, silk and woollen stuffs, stockings, horse-coverings, shawls, &c., but especially lace, for which gold and silver threads are obtained from Russia. Long centuries of oppression and almost servitude have very much sapped the military habits and spirit of the people, though in the Russo-Turkish war of 1877-78 many Armenians distinguished themselves by their bravery. A large number held high places in the Russian army, among the most distinguished being General Loris Melikoff. According to Viscount Bryce, the Buxtons, and other travellers, the Armenians enjoyed under Russia security of person and property, and protection for the honour of their families, such as was not vouchsafed to them by either Turkey or Persia.

History.—The Armenians called themselves Hai (from Haik, son of Torgom, great-grandson of Japheth, son of Noah), and their country Hayastan; the name Armenia being conferred by the Medes, who applied this, the name of a single obscure clan, to the whole land. They have been known as a nation under this name since the time of Herodotus, and probably earlier. After being ruled by kings of their own, they fell successively under the Assyrian, Median, and Persian empires, retaining under the Persians their own princes, and merely paying tribute to the Great King. Having, under Digran or Tigranes, become the centre of an empire extending from the Orontes to the Caspian, Armenia was shattered by the Roman Lucullus, who penetrated to Artaxata at the NE. of Ararat (69 B.C.). Shapur, the second of the Sassanid kings, conquered Armenia, but under Diocletian it was recovered for Rome, and Tiridates the Great returned to his ancestral throne. This Tiridates having been converted to Christianity by St Gregory the Enlightener, Armenia became henceforward the bulwark of Christianity in Asia. Overrun by the Persian fire-worshippers, and, after the fall of Persia, by the Mohammedan khalifs of Bagdad, sometimes supported, sometimes abandoned, by the Byzantine emperors, and a prey to internal dissensions, Armenia yet re-emerged, in the 9th century, into a state of some importance.

In 885 A.D. Aschod I., of an old and powerful Armenian family, ascended the throne, with the permission of the khalifs, and founded the third Armenian dynasty—that of the Bagratids, who claim descent from King David of Israel. Under them Armenia was prosperous. The magnificent ruins of their capital at Ani, between Etchmiadzin and Kars, still testify to the transitory splendour of their kingdom. In the 11th century divisions and internal strife again began to weaken the country; till at length the Greeks seized a part of the kingdom, while the Turks and the Kurds made themselves masters of the rest—only one or two of the native princes maintaining a perilous independence. In 1242 the whole of Armenia Major was conquered by the Mongols. Leon VI., last king of Armenia, was taken prisoner by the Saracens, 1375, and died at Paris in 1393. In 1472 the eastern part of Armenia became a Persian province. Afterwards the western part fell into the hands of the Turkish sultan, Selim II.

The subsequent history of Armenia is that of devastation by the Mongols and the hosts of Timur, and of a long contest between the Ottoman sultans and Persia for the possession of that ancient kingdom. At length Russia approached from the north, welcomed by the Armenians as a suzerain preferable to either Turkey or Persia. Even before crossing the Caucasus and establishing herself in Georgia, Russia had interfered for the protection of the Armenian Christians. The Armenian patriarch Narses, too, had encouraged his people to look to Russia for protection. In 1827 the tear wrested from Persia the whole of the upper valley of the Araxes, including Etchmiadzin. On the conclusion of peace between Russia and Turkey in 1829, when the Russians retired from Erzerum, a multitude of Armenian subjects of Turkey followed them, electing to settle in Russian territory. Under the Armenian 'National Constitution' (published 1863), an Assembly of Armenians sat at Constantinople. The local patriarch presided. Elected from all parts of Turkey, it included Committees for Civil and for Ecclesiastical Affairs. At the close of the Russo-Turkish war, by the treaty of Berlin (1878) Ardahan and Kars were ceded to Russia. Armenians in many districts were slaughtered or expelled by Kurds. During the negotiation of the Berlin treaty Great

Britain entered into a secret compact with the sultan, guaranteeing Turkey the integrity of her Asiatic possessions on condition that Turkey should effect reforms and protect the Armenians from Kurds and Circassians. In 1894 a series of horrible atrocities in the Sasun district led to a European commission and remonstrances; it was estimated that by 1896 200,000 Armenians had perished. As, in 1879, these atrocities greatly agitated European relations and British party politics; they led to Gladstone's last public speech (1906) and Lord Rosebery's resignation of the Liberal leadership. During the Turkish Revolution (1908) Armenians and Young Turks fraternised; but the reforms promised in 1878 and 1895 remained unfulfilled, and massacres at Adana (1909) and elsewhere added thousands to the list of victims. Massacres on a huge scale were renewed during the great European war and the negotiations that followed. In 1916 Erzerum and other places in Turkish Armenia fell to the Russians, but were retaken in 1918 by the Turks, who also overran much of Russian and Persian Armenia. British troops occupied Armenia at the end of the war. On their withdrawal the Armenians became embroiled with Turks, Kurds, and Azerbaijan Tatars. A nucleus for an independent Armenia, the republic of Eilvan (Russian Armenia) was for a short time part of the federal Transcaucasian republic (with Georgia and Azerbaijan), but separated in 1918. Recognised in 1920, it was sovietised in the same year, and over-run by Turks and Russians. Under the treaty of Sévres President Wilson fixed the boundary with Turkey in the vilayets of Trebizond, Erzerum, Bitlis, and Van.

The Church.—The earliest authentic accounts of the introduction of Christianity into Armenia date from the apostolical exertions of St Gregory (q.v.), who in the beginning of the 4th century converted King Tiridates and a large part of the people. In the same century Armenian Christians were found studying at Athens. Christianity was further confirmed in Armenia by Mesrob's translation of the Bible into the Armenian language in the 5th century. In the ecclesiastical controversy concerning the twofold nature of Christ, the Armenian Christians refused (491 A.D.) to accept the decisions of the Council of Chalcedon, and constituted themselves a separate church, which took the title of Gregorian from Gregory himself. For several centuries a spirit of scientific inquiry, especially in theology, manifested itself amongst them to a far wider extent than in the other eastern churches. Their greatest divine is Nerses of Klah, belonging to the 12th century. The Roman Catholic popes at various times, especially (1145, 1341, 1439) when the Armenians accepted the help of the West against the Mohammedans, tried to persuade them to recognise the papal supremacy; but only in 1439 was union with Rome accepted by the scattered members of the Armenian Church outside of Armenia, on the basis that, while assenting to the dogma of the two natures, they should retain their national and ritual peculiarities. The Armenian Church was thus split up into two communions—the Gregorian or 'orthodox' (really monophysite, if not also adoptian), and the Uniate or United-Catholics, fanatically opposed to each other. The dogma of the pope's infallibility induced for a time dissension among the united party. The theology of the non-united Armenians, four times as numerous as the others, attributes only *one* nature to Christ, and holds, with the orthodox Greek Church, that the Spirit proceeds from the Father alone. (See GREEK CHURCH.) With respect to the 'seven sacraments,' it entertains the peculiar notions that at baptism one must be sprinkled three times, and as often dipped; that confirmation is to be con-

joined with baptism; that the Lord's Supper must be celebrated with pure wine and leavened bread; that the latter, before being handed round, must be dipped in the former; and that extreme unction is to be administered to ecclesiastics alone, and that immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek Church in the number of its fasts, but has fewer religious festivals. Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is in the new. Its sacerdotal constitution differs little from the Greek. The head of the church, whose title is Catholikos, and to whom the Armenian patriarchs of Jerusalem and Constantinople are subordinate, resides at Etchmiadzin ('the Son of God come down,' the scene of St Gregory's vision), near Erivan, the ecclesiastical metropolis of the Armenian nation since 302 A.D., and claiming to be the world's oldest monastic foundation. Etchmiadzin is an educational centre, possessing a rich library and a University College (founded 1874). The Catholikos was chosen by the tsar from two candidates elected by the whole people. The Catholikos of Sis in Cilicia once claimed the chief patriarchate. Parish priests (appointed by their congregations) marry, but not the higher clergy. Although directed by lay committees, education is largely promoted by the Church. Each monastery is supposed to have a seminary, library, printing-office, hospital, &c. Educational and religious work is also carried on by English and American Protestant missions.

Literature.—Previous to the introduction of Christianity by Gregory (300 A.D.), the Armenians had adhered to the Assyrian or Medo-Persian system of culture; but excepting a few old songs or ballads, no remains of that early period exist. After their conversion to Christianity, the Greek language and its literature soon became favourite objects of study, and many Greek authors were translated into Armenian. The earliest inscriptions are cuneiform. At a later period the Greek alphabet was used by the West, and Syriac by the East Armenians. In the beginning of the 5th century, St Mesrob, along with Sahak the Great, directed the Armenian translation of the Bible, esteemed the highest model of classic style. The most flourishing period of Armenian literature extends from the 4th to the 14th century. The numerous Armenian theological writers and chroniclers of this era supply materials for a history of the East during the middle ages which have hitherto been too much neglected. These Armenian writers generally copied the style of the later Greek and Byzantine authors. In the 14th century literature began to decline, and few remarkable works were afterwards produced; but since their dispersion, the Armenians have ever cherished their national literature. Translations of several Greek authors, made in the 5th century, have been partly preserved, and contain some writings of which the originals have been lost—namely, the Chronicle of Eusebius; the Discourses of Philo; Homilies by St Chrysostom, Severianus, Basil the Great, and Ephraem Syrus. Among philosophical and theological writers may be mentioned: David, the translator and commentator of Aristotle, Esnik, and Joannes Omiensis. The *Vita Sanctorum Calendarii Armeniaci* (Lives of Armenian Saints, 12 vols. Ven. 1814) contains many notices of the history of Armenia. A considerable stirring of intellectual and even literary activity has recently manifested itself in northern Armenia and Constantinople. The Armenian belongs to the Indo-Germanic group of languages, and though it is usually regarded as an offshoot of the Iranic branch, recent scholars of eminence have main-

tained its right to rank as a distinct branch, intermediate between the Iranic and European divisions of the group. It has certainly a very independent character, and has many peculiarities of structure. There are usually no distinctions of gender amongst nouns, and there are seven cases; while the verb has four conjugations and four tenses. In many respects the syntax of old Armenian, the language of literature, which is no longer a living tongue, resembles classical Greek; whereas the modern Armenian, split up into four dialects, contains many Persian and Turkish words. The Eastern dialect is, as might be expected, much purer than that of Constantinople. The language has great strength and flexibility; is consonantal and harsh to the ear. The alphabet, which has thirty-six characters, usually said to have been partly formed on the Greek model by St Mesrob, seems rather to have been adapted by him from the Palmyrene alphabet. The Proto-Armenian inhabitants, who possibly included Hittite and Assyrian (Semitic) elements, were conquered by Aryans in the 7th century B.C. Arab, Seljuk, Mongol, and Tatar invasions explain the diversity of type of modern Armenians.

Appended is the verse John iii. 16, in old or ecclesiastical Armenian:

Թի այնպէս սիրեաց Մատուած զաշխարհ
մինչև զ(Ն)րդին իւր միածին եւ . զի ամենայն
որ հաւատայ 'ի նա՝ մի՛ կորցէ, այլ ընկալցի
զինանն յաւիտեանականս .

Mag.*, August 1913; F. B. Lynch's *Armenia* (2 vols. 1901); N. and H. Buxton's *Travel and Politics in Armenia* (1914); W. L. Williams's *Armenia Past and Present* (1916); also TURKEY, CAUCASUS, and PERSIA.

Armentières, a French town in Nord, 12 miles WNW. of Lille, with textile industries and trade in grain. See WAR (GREAT).

Armfelt, GUSTAF MAURITZ (1757-1814), born in Finland, during the war between Sweden and Russia defeated the Russians, and enjoyed the confidence of Gustavus III. By the will of the king, assassinated in 1792, Armfelt was made governor of Stockholm and a member of the council of the regent. But the regent, Charles, the late king's brother, resented Armfelt's influence, and destroyed and disregarded the will. Armfelt was hardly allowed to see the young king, and was glad at last to depart as ambassador to Naples, where he plotted against the regent and sought to have the young king proclaimed of age and sovereign. The plot being discovered, Armfelt had to flee to Russia, and was proscribed for high treason. Under Gustavus IV. Armfelt was restored to all his goods and honours, was appointed governor-general of Finland, in 1806 commanded the Swedes in Pomerania, and in 1808 had command of the Swedish army designed to invade Norway. His plans were foiled; he was regarded as an unsuccessful and inefficient general, and he was recalled and dismissed by his patron. But in 1809 Gustavus IV. was deposed, the former regent being put in his place, and Armfelt saw that his star had finally set, though some small offices were conferred on him. Erelong Armfelt once more withdrew to Russia, where he lived in high honour, was a member of the Russian senate, and president of

the Board of Finland (now Russian). See Tegner's monograph (1887).

Armida, in Tasso's *Jerusalem Delivered*, was a beautiful sorceress employed by Satan to seduce the crusaders at Jerusalem, who for love of Rinaldo became a Christian.

Armillary Sphere, an instrument intended to show the constitution of the heavens and the motions of the heavenly bodies. It consists of a number of rings fixed together so as to represent the principal circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. By means of this instrument—now superseded, even for purposes of instruction in astronomy, by the celestial globe (see GLOBES)—Ptolemy and astronomers down to Tycho Brahe made many of their observations.

Arminius (16 B.C.-20 A.D.), a famous chief of the German Cherusci, who in 9 A.D., in a three days' battle in the all but impassable Teutoburg Forest, probably near Detmold, annihilated the whole Roman army under Varus. In two campaigns in 14 and 16 A.D. Germanicus reduced Arminius to straits, but was recalled by Tiberius in 17; and no Roman army ever afterwards penetrated into the heart of Germany. Arminius fell about 20 A.D. in an intestine feud amongst the German tribes. The Cherusci inhabited part of what is now Hanover and Brunswick; and Arminius had in youth learnt the secrets of Roman warfare as commander of a body of Cheruscan allies in the Roman service.

Arminius, JACOBUS (Latinised from Harmensen), the founder of Arminianism, was born in 1560, at Oudewater, in South Holland, studied at Utrecht, at Leyden, at Geneva under Beza (a rigid Calvinist), and at Basel. In 1586 he travelled into Italy; and on his return to Amsterdam (1588) was ordained a minister. Shortly after this he was commissioned to defend the doctrine of Beza on predestination against proposed changes, and in the end came to adopt the opinions he had been commissioned to confute, though he long maintained that they were not inconsistent with the doctrinal standards of the Dutch Reformed Church. In spite of opposition from the Conservative party, he was in 1603 made professor of Theology at Leyden, the great training-school for the Dutch clergy. His chief opponent was his colleague Gomar (q.v.). In 1604 Gomar attacked his doctrines, and from that hour to the end of his life, Arminius was engaged in a series of bitter disputes with his opponents, maintaining that God bestows forgiveness and eternal life on all who repent of their sins and believe in Christ; he wills that all men should attain salvation, and only because he has from eternity foreseen the belief or unbelief of individuals, has he from eternity determined the fate of each. On the other hand, Gomar and his party, appealing to the Belgic Confession and the Heidelberg Catechism, maintained that God had, by an eternal decree, predestinated what persons shall, as being elected to salvation, be therefore awakened to repentance and faith, and by grace made to persevere therein; and what persons shall, as being rejected (*reprobati*), be left to sin, to unbelief, and to perdition (see PREDESTINATION). All the pulpits in Holland now thundered against the heretic, though he was not without friends and backing; in 1607 he was 'Rector magnificus' of the university. In 1608, Arminius himself applied to the States of Holland to convoke a synod for the purpose of settling the controversy, but, worn out with illness and anxiety, he died on the 19th of October 1609, before it was held. Arminius, who was admittedly

a faithful pastor and a devout Christian, was doubtless much less Arminian than his followers. He had not elaborated a complete system of anti-Calvinistic doctrine, but the famous 'Five Articles' of his disciples are the logical results of his teaching.

After his death his followers gained strength, and boldly asserted their views, but still remained in a minority. In 1610 they presented to the assembled States of the provinces of Holland a 'Remonstrance'—from which they were styled 'Remonstrants'—which contained the following propositions: (1) That God had indeed made an eternal decree, but only on the conditional terms that all who believe in Christ shall be saved, while all who refuse to believe must perish; so that predestination is only conditional. (2) That Christ died for all men, but that none except believers are really saved by his death. The intention, in other words, is universal, but the efficacy may be restricted by unbelief. (3) That no man is of himself able to exercise a saving faith, but must be born again of God in Christ through the Holy Spirit. (4) That without the grace of God, man can neither think, will, nor do anything good; yet that grace does not act in men in an irresistible way. (5) That believers are able, by the aid of the Holy Spirit, victoriously to resist sin; but that the question of the possibility of a fall from grace must be determined by a further examination of the Scriptures on this point.

This last point, left as an open question, was decided by the Remonstrants in the affirmative soon afterwards (1611). Whereupon the Gomarists (Calvinists) put forth a strong 'Counter-remonstrance,' asserting plainly absolute predestination and reprobation. After several fruitless discussions, the States of Holland, in January 1614, issued an edict of full toleration for both parties, prohibiting at the same time the continuance of the controversy. The Counter-remonstrants refused to submit to this edict, and the strife soon became so furious, that in 1617, or soon afterwards, the Arminians found it necessary to guard themselves from personal violence by appointing a safeguard of militia-men (*Waardgelders*). The controversy now merged in the strife of party politics. The ambitious Maurice of Orange took advantage of the passions of the majority to crush his opponents of the republican party, whose leaders were adherents of the Arminian doctrines. Several Arminians were put to death, and others were imprisoned (Oldenbarneveltdt, Grotius). In these circumstances, the Synod of Dort was held (1618-19), attended by selected representatives from the Netherlands, England, Scotland, the Palatinate, Switzerland, Nassau, East Friesland, and Bremen. From this convocation (January 14, 1619) the thirteen Arminian pastors, with the learned and eloquent Simon Episcopius at their head, were excluded. The doctrines of the Counter-remonstrants were embodied in ninety-three canons; the Belgic Confession and the Heidelberg Catechism were confirmed as authorities for the reformed churches of the Netherlands; and three hundred Arminians (chiefly preachers) were expelled from office. In consequence of this decision, the defeated party sought shelter abroad, but under Maurice's successor (1630) they were again tolerated in Holland.

Since that time, the Remonstrants (or Arminians) in Holland have inclined more and more towards freedom of thought on religious questions, and independence in church government. The rejection of all creeds and confessions; the free interpretation of the Scriptures; a preference of moral to doctrinal teaching; Arian views respecting the Trinity; the virtual rejection of the doctrines of original sin and imputed righteousness; and the view of the sacra-

ments as merely edifying forms or ceremonies—all are characteristic. In their theological school, established at Amsterdam in 1634, eminent theologians such as Episcopius, Limborch, Clericus, and Wetstein taught, bringing their influence to bear on Germany, Britain, and on other Protestant countries. As the national church in Holland became less and less distinctively Calvinist, the separate testimony of the Remonstrants became the less necessary, and save at Rotterdam and Amsterdam they are few in numbers. Their views were akin to those of many of the Greek fathers, of the semi-Pelagians, and of Erasmus. In the 18th century, a number of Arminians went formally over to the Arian or Socinian position, departing further and further from the Reformed theology. But while the Arminians were dwindling away as a distinct body, their influence was widespread in the orthodox churches. Arminian influence became marked in the Church of England before Laud's time (see LATITUDINARIANS, HALES). Their tenets on predestination were adopted (with some modification) by Wesleyans and General Baptists, as well as by many individual members of Calvinistic churches. Wesley's movement gave Arminianism a new life and some new features; and, thus modified, Arminianism became the theology of Methodism. Aversion to the harsher aspects of Calvinism is characteristic not merely of the Broad Church, but of 'modern theology' generally. Since the downfall of Jansenism, Arminian views are also the prevalent doctrine in the Church of Rome.

The works of Arminius were translated in 1825-56, also the Life of him by Brandt (1854). The standard history of the Remonstrants is that by Regenboog (1780). See Schaff's *Creeds of Christendom*, Motley's *Barneveldt*.

Armistice, a temporary suspension of hostilities between two armies, or two nations at war, by mutual agreement. It takes place sometimes when both are exhausted, and at other times when an endeavour to form a treaty of peace is being made. A local armistice may be arranged by any part of the opposing forces; a general armistice affecting all the troops in the field can be entered into only by the commanders-in-chief or by the home governments.

Armisticio, a region, formerly a territory, of Venezuela, bordering on Colombia. Armisticio is fertile and abundantly watered by several important tributaries of the Orinoco.

Armitage, EDWARD (1817-96), historical and mural painter, was born in London, and studied in Paris and Rome, being for a time a pupil of Delaroche. In 1843 his cartoon on 'Cæsar's Invasion of England' won a prize. He became A.R.A. in 1867, R.A. in 1872. Most of his contributions to the Academy exhibitions were on scriptural subjects. His most notable frescoes are in St John's Roman Catholic church in London and in the Houses of Parliament.

Armorica, the country of the Armorici, who, in Cæsar's time, occupied the coast of Gaul between the Seine and the Loire; later the name was confined to Brittany (q.v.). The *mor* in Armorica is obviously the Celtic word for 'sea,' from the same root as Lat. *mare*, and the Slavic *mer* in *Pomerania*, meaning 'coastland.'

Armour is a general term for the apparatus of personal defence, as distinguished from arms or weapons of offence. The commonest implement of defence in prehistoric and early historic times in Europe was the shield. The earliest known shields are of bronze, and circular, and were held in the left hand by a handle under the central boss. In addition to the shield, the early Greeks used greaves and helmets of bronze, and to these, in later times, a cuirass of breast and back plates was

added. The Romans added shoulder-guards to the cuirass, which was modelled to the bust, and furnished with a series of pendent plates, reaching almost to mid-thigh. It is not known when the tunic of interlinked rings, or coat of mail, first made its appearance in Europe. Flexible cuirasses were worn by the Roman *Hastati*, but there is no distinct evidence of their construction. Portions of

Fig. 1.—From Brass of Sir John de St Quintin, 1397: Plate-armour, beginning of 16th Century:

- 1, helmet; 2, visor; 3, gorget; 3a, camail; 4, breastplate; 5, skirt; 6, arm-pieces; 7, elbow-piece; 8, gauntlet; 9, hauberk; 10, thigh-piece; 11, knee-piece; 12, greaves; 13, sollerets; 14, lance-rest; 15, belt.

chain-mail, formed of small riveted rings interlinked together, have been found in the mosses of Sleswick, associated with articles of decoration, exhibiting the influence of Roman art of about the 3d century. It seems unquestionable that chain-mail was in general use among the Northern nations long before the crusades. The enthusiasm engendered by the Holy Wars, however, gave a general impetus to the adoption of this species of personal defence, and under the feudal system, which prescribed for every man the arms and armour conformable to his condition, the period of the principal development of body-armour was reached. Disregarding the equipment of the common mass of combatants—which generally consisted of a suit of leather or other material quilted or stuffed, or padded with cotton or waste, or studded or masced with small plates or scales of iron—the suits of armour worn by the knights and nobles were of costly workmanship, and splendidly adorned. In armour, as in dress, the changing fashions of the different periods are strongly marked. At the time of the Norman Conquest of England, or about the middle of the 11th century, the armour consisted of a *hauberk* or tunic of mail for the body, hose of mail for the legs, a conical helmet with nasal, and a circular or kite-shaped shield. This continued to be the style of equipment throughout the 12th century. By the assize of arms of Henry II. in 1181, every knight

was bound to have as many coats of fence (*lorica*), helmets, shields, and lances, as he had knights' fees in his domain; and the freemen and burgesses were to have habergeons or *gumbesons*, and iron caps. The Scots had not generally adopted the use of defensive armour, for at the battle of the Standard, in 1138, the Earl of Strathearn is represented as saying: 'I wear no armour, yet they who do will not advance beyond me this day.' Towards the end of the 12th century, the round shield becomes rare, and the kite-shape gives way to the triangular or flatiron-shaped shield, and the conical helmet to the cylindrical and flat-topped form. In the first part of the 13th century, the hauberk and hose, or long *chausses* of mail, remained the usual body-armour of the knight; but in the second half of the century, the mail defences of the limbs began to be reinforced by portions of plate attached as shoulder-pieces, and elbow and knee pieces, to which were speedily added greaves or shin-pieces. The hauberk was made, in the beginning of the century, with a continuous coif for the head, and gloves not divided into fingers, but having an aperture in the centre of the palm. The coif of mail, which at the commencement of the 13th century was flat-topped, became round-topped in the second half of the century, and instead of it, the hood of mail, with a wide tippet which fell over the hauberk on the shoulders, was coming into use. Over the coif or hood, the great helm was worn in action, completely encasing the head, and perforated in front with small apertures for light and air. In the early part of the century, the cylindrical, flat-topped helm was the common form; in the middle of the century, the round-topped form prevailed; and by the end of the century, the top had assumed more of the form of a sugar-loaf. The armour was also extended from the man to the horse, which had a *couverture* of chain-mail fitting tightly to the head and neck, and falling loosely over the body.

The 14th century was the period of the greatest development of body-armour, marking the transition from the coat of mail to the panoply of plate. The knightly equipment at this period necessitated the wearing of four or five different casings or defences over each other. Below the chain-mail, which was still worn, the quilted gambeson was needed to soften the pressure; over the mail was the corselet, with other reinforcements of plate, and over all, a second quilted garment, which might or might not be covered by the surcoat, usually worn uppermost for the purpose of displaying the knightly emblazonment. The hauberk now terminates at the neck, which is defended by a gorget of scale or plate. An ample corselet protects the breast, and the shoulders, elbows, and hands have each their special defences, either of articulated plates or single pieces. The reinforcements to the chausses or hose of mail which protected the legs in the previous century, gradually give way to complete defences of plate, the greaves fitting to the knee-pieces, and these to the thigh-pieces, till in the latter part of the century the legs were completely incased in tubular *jambards*, or jointed casings of plate, which opened upon hinges on the outside of the leg, and fastened on the inside. The feet were inclosed in *sollerets*, or shoe-like casings, of articulated plates, the long-pointed toe of the solleret marking the second half of the century. Under the pointed or dome-topped helm, the coif or hood of chain-mail is discarded for the *bassinet*, a high-peaked cap of steel, round the lower part of which is laced the upper edge of the *camail* or tippet of chain-mail falling down over the neck and shoulders. The helm, when placed over the *bassinet*, completely covers the head and face; it is perforated with clusters of small holes for breathing,

and for sight is furnished with a narrow cleft extending from temple to temple. Before the close of the century, the visored bassinet and camail were often used instead of the unwieldy helm. The shields were still triangular, but shorter than in the previous century. On the shield and surcoat were emblazoned the wearer's armorial bearings, and the military belt of this period, which confined the lower part of the surcoat, was often the most brilliant and costly part of the equipment, formed of elaborately worked plaques of precious metals, jewelled or enamelled, and furnished with pendants. The horses were almost as closely clad in plate as their riders; and in consequence of the weight they bore, a fall was often fatal to them both. In the 15th century, the development of plate-armour proceeded until, towards the middle of the century, body and limbs were completely enveloped in an articulated casing of iron plates.

Fig. 3.—Suit of Armour presented by the Emperor Maximilian to Henry VIII., showing the Horse-armour.

Articulations fitted to the upper parts of the arm-plates were carried over the shoulders, and the joints were protected by fan-shaped projections. The body, below the breast and back plates, was enveloped in a skirt of wide, hoop-like plates called *tassets*. To the lower part of these there were attached a series of more loosely hanging plates called *tuilles*. The leg defences are angular in front, the long-pointed toes of the sollerets are shortened, and the gauntlets formed with articulating plates down to the points of the fingers. The bassinet and camail are being discarded in favour of the *salade*, a species of skull-cap, worn with a gorget and chin-piece separate from it. In this century, the introduction of gunpowder marks the period from which body-armour began to decline in importance, as being no longer proof against the new weapons of attack. The whole system of warfare was changed, tactics took the place of chivalry, and fortification of strong places against artillery superseded the system of iron-clad men. The full panoply of armour was still kept up for the joust and the tournament, but for actual service the tendency was henceforth in the direction of its disuse. In the 16th century, so prolific in changes, there was no longer the same uniformity of equipment. Instead of the long encircling skirt of hoop-like tassets, with tuilles attached, there is now a shortened skirt with a series of sliding and overlapping plates depending over each thigh, from the waist to the knee. The head defences are visored helmets or *salades* and morions. In the 17th century, officers and pikemen still retained the cumbersome body-suit of breast and back plates, with the short skirt of tassets and thigh-pieces; and in the 18th century, body-armour had been reduced to a mere embellishment of the military parade.

The most authentic sources of information as to the changing fashions of body-armour in the middle

ages are illuminated manuscripts, the Bayeux tapestry, and monumental effigies and brasses in churches.

See works by Meyrick (1842), Hewitt (1855-59), Bontell (1869), Lacombe (1874), Brett (1894), Laking (1920-22); and for modern armour, Dean (1920).

Arms or ARMORIAL BEARINGS. See **HERALDRY**.

Armstrong, JOHN (1709-79), physician and poet, was born in Castleton Munse, Liddesdale, Roxburghshire; took the Edinburgh M.D. in 1732; and commenced practice in London. In 1736 he published a nauseous poem, *The Economy of Love*, and in 1744 his principal work, *The Art of Preserving Health*, a didactic poem in four books, besides sketches, miscellanies, and notes of travel.

Armstrong, LORD (WILLIAM GEORGE ARMSTRONG; 1810-1900), inventor, born at Newcastle, was bred a lawyer, but in 1840-45 invented a hydraulic engine and crane and electric apparatus. F.R.S. (1846), he commenced the Elswick Engine works, Newcastle. This large establishment was soon to be famous for its ordnance, and especially the Armstrong gun, of which the barrel is built up of successive coils of wrought-iron. Till 1863 there existed a kind of partnership between government and the Elswick firm, Armstrong being knighted in 1858. The firm, which since 1882 comprises ship building, has a branch (for military engineering) near Pozzuoli. In 1887 Armstrong was created Baron Armstrong.

Army, a body of armed men organised and disciplined to act together for purposes of warfare on land in accordance with the will of one man. An army is organised in the sense that it is a whole composed of a large number of individual parts or powers arranged so that their aggregate force may be exerted in any required direction. The individual parts derive their value from this capacity for concerted action, and in order to maintain it must be systematically combined and inter-dependent. Discipline, on the other hand, is concerned with the element of human will. Through authority it secures the subordination of many wills to the single will of the general. Through training in evolutions and the use of weapons it secures that this single will shall be accurately expressed in a series of calculated and orderly actions. By these means large bodies of men are induced to perform in unison the evolutions of the march and battlefield under the absolute direction of a single commander. Armies may fall short of the full standard of cohesion and *moral* implied by this definition, but to deserve the name they must attain it in some degree; and generally speaking the object of all military operations is to destroy these elements in the opposing force. Technically the organisation of an army is of two kinds, tactical and administrative. The former enables the leader of an army to transmit his orders to three or four subordinate commanders, who pass them on to three or four others under them, until, through a regular chain of responsibility, the original impulse is communicated to the private soldier (see **TACTICS**). The latter, in a similar manner, divides the army into groups of gradually decreasing size, so that the men may be efficiently paid, fed, clothed, and armed (see **ARMY ADMINISTRATION**). The present article will treat only of the constitution and establishment of armies, and indicate their gradual historical development. Technical terms generally, as well as all the component elements of the army in *personnel* and *matériel*, and the organisation and duties of the troops, will be found noticed under their proper headings; the tactical positions of an army are defined below.

Ancient Armies.—The earliest regular military organisation is attributed to Rameses II., known

to history also as Seso-tris, who ascended the throne of Egypt about 1300 B.C. He is said to have divided Egypt into thirty-six military provinces, and established a sort of militia or warrior caste, to each member of which he allotted lands for the support of himself and his family. His army took the field in four territorial divisions, each called after the name of a god, and was supported by the sea-power of a fleet. If later historians may be believed, his conquests carried him beyond the Ganges, through Tartary, and into Europe from north of the Caspian. After him, little further progress was made in military art until the Persian empire arose. Its soldiers introduced the mass-formation, with cavalry in intervals of squares; but the most important feature of the Persian organisation was the establishment of what was practically a standing army, divided as garrisons throughout the conquered provinces, and under the control of military governors distinct from the satraps. In time of war this standing army was augmented by a general levy which included the tributary nations, and therefore resulted in a heterogeneous collection of barbarous and undisciplined peoples; a source of weakness which caused the defeat of Xerxes' numerically powerful army by the Greeks. In Greece, it was not a standing army, but a national militia, subjected to an almost continuous training in the field that gained Marathon, Plataea, and Mycale. Their discipline was the fruit of a highly specialised moral and physical education; but nevertheless, judged by later standards, was not remarkable. Organisation and tactics were closely studied, and the Phalanx (q.v.), the basis of Greek military formations, was successively modified and improved by the various states. Sparta was the inventor of this particular mass-formation for foot-soldiers. The Athenians made it more mobile and added lighter troops to cover its attack. Their cavalry did not come into existence until after the Persian War, and was at no time very efficient. The charge of the Athenian army at Marathon showed the crowning excellence of their rapid system of attack; and Miltiades, their leader, is said to have first invented the 'double step,' to increase the momentum of a phalanx when rushing on the enemy. The Thebans introduced the column formation, which, being deeper and narrower than the phalanx, was intended to pierce the enemy's line at some one point, and throw them into confusion. Philip, the father of Alexander the Great, established in Macedonia the world's second standing army; and, as a further change, made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use the Macedonian pike, a formidable weapon 24 feet in length. With a phalanx sixteen ranks in depth, six rows of men could present the points of these long pikes protruding in front of the front rank, forming a bristling array of steel terrible to encounter. Meanwhile a more western power was developing what was perhaps the most perfect organisation in the annals of military history. The Romans initiated changes in army matters which have had a widespread influence throughout the civilised world. About the period 200 B.C., every Roman from the age of 17 to 46 was liable to be called upon to serve as a soldier; the younger men were preferred, but all were available up to the middle time of life. They went through a very severe course of drill and discipline to fit them alike for marching, fighting, camping, working, carrying, and other active duties. Every year the magistrates sent up the names of eligible men, and tribunes selected a certain number from this list to form Legions (q.v.) or army corps. The Roman legion retained this militia character until Augustus established a permanent defensive

force on the frontiers. In its best days, it excelled all other troops alike in discipline and in *esprit*. So long as none but freemen were enlisted the position of a legionary was one of honour; but when, in the course of the civil wars, it became necessary to supply the armies of ambitious leaders with large drafts of slaves and criminals, the character of the body naturally fell with that of the individual. With a gradual laxity in discipline, the decline of the Roman power commenced. The undercurrent of insubordination resulted in reverses, and though discipline was revived spasmodically under great commanders, it ultimately died out.

Medieval Armies.—With the decline of the Roman power all that remained of scientific warfare was lost for a time. The northern invaders made little use of tactics, but relied chiefly on their personal bravery and on the impetuosity and weight of their attack in column. The army, among the Franks and Germans was the nation. Every freeman bore arms alike as a duty and as a privilege. Kings and generals were entrusted in time of war with an absolute power, which the nation resumed with the return of peace. The conquerors of the Roman Empire at first recognised no superior save the community, of which all conquests were the property. What all had aided to acquire all demanded equally to share. Hence arose a division of the conquered territory, individual chiefs rewarding their own followers with gifts of the lands they had helped to conquer. The growth of a feeling that such gifts could be revoked, and that they implied an obligation to future service, marks the beginning of the Feudal period (see FEUDALISM), when national armies disappeared, and each baron had a small army composed of his own militia or retainers, available for battle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the middle ages. Of military tactics or strategy there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valour than by any well-concerted plan. The characteristics of the system most strongly opposed to the progress of military science were the undue importance attached to the cavalry, the want of organisation resulting from the numerous rival commands which made up its armies, and the shortness of the service, extending only to twenty days, or at the most three months, in every year. The Crusades (q.v.) effected some improvement in all these respects. The forces which went to the Holy Land were at first mere armed mobs, upheld by fanaticism, but ignorant of all discipline, and under leaders destitute alike of forethought and powers of combination. The reverses they sustained, however, showed the necessity for some organisation, and the extended service called attention to and developed the value of the foot-soldiers. From this period dates the modern recognition of the importance of an arm which increased under the franchise extended to the towns, and the superiority of which, since the overthrow of the Burgundian chivalry by Swiss infantry in the three disastrous battles of 1476-77, has never been disputed. The invention of gunpowder effected much less change during the middle ages than is generally supposed. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valour, everything connected with the military art underwent a revolution. Historically, however, this great change was not very apparent until after this period. The art of making good cannon and hand-guns grew up gradually, like other arts; and armies long continued to depend

principally on the older weapons—spears, darts, arrows, axes, maces, swords, and daggers. As to army-formation, there was still little that could deserve the name; there was no particular order of battle; each knight sought how he could best distinguish himself by personal valour; and sometimes it happened that the fate of a battle was allowed to depend on a combat between two knights. No attempt was made, until towards the close of the 15th century, to embody a system of tactics and manœuvres for cavalry; and even that attempt was of the most primitive kind. Not was it far otherwise with the foot-soldiers; they were gradually becoming acquainted with use of firearms; but, midway as it were between two systems, they observed neither completely; and the armies in which they served presented very little definite organisation.

Modern Armies.—The Turkish Janissary force (q.v.), the earliest standing army in Europe, was fully organised in 1362; but the formation of standing armies among western powers, which may be said to have introduced the modern military system, dates from the establishment of *compagnies d'ordonnance* by Charles VII. of France, nearly a century later. These companies of men-at-arms amounted, with their attendants, to 9000 men; and to them the king afterwards added 16,000 franc-archers, largely recruited from the mercenaries which growing wealth and luxury had developed. The superiority of such a force over militia forced its adoption on the surrounding states. Monarchs contracted with powerful nobles to raise, by enlistment, regiments, which were now broken up into squadrons or battalions as tactical units, the regiment remaining the administrative unit. Between the beginning of the 16th and the end of the 18th centuries the proportion of musketeers gradually increased; the pike was abandoned for the bayonet, and even the cavalry were taught to rely more on their fire than on the effect of their charge. The improvements in weapons naturally affected the formation. During the Thirty Years' War (1618–48), Gustavus Adolphus and Wallenstein adopted opposite modes of dealing with masses of infantry; the former spread them out to a great width, and only six ranks in depth; whereas the latter adopted a narrower front, with a depth of twenty to thirty ranks. In Louis XIV.'s reign, the prolonged wars introduced the larger grouping in brigades and divisions. Frederick the Great, in the next century, reduced the depth of his infantry formation to three ranks, and introduced a most rigid and exact system of tactics and drill; so that when able to manœuvre he nearly always won his battles; but when the result depended on bold and unexpected onslaughts he was more frequently a loser than a winner. He, however, greatly improved the cavalry tactics, and restored to this arm a reliance on the effect of a rapid charge, while the introduction of horse artillery added to its power.

The French Revolution effected almost as great changes in the military as in the political organisation of Europe. Hitherto armies had been deprived of mobility on the march by the system of supply magazines and hampered in battle by the method of line tactics and a mistaken adherence to mere manœuvring. Napoleon destroyed these traditions, and devised the policy of living on the country and aiming at the direct destruction of the enemy's army. At the same time a great change took place in the relation of armies to the state. They now consisted no longer of mercenaries paid out of the proceeds of their victories, but of annual contingents of the native population. As early as 1793 France had almost exhausted her supply of voluntary recruits, and compulsory requisition was introduced. In 1799 systematic conscription was made the sole law; the population was classified according

to age; every citizen was declared liable to five years' service, and all between the ages of 20 and 25 were enrolled. The immense advantage which this terrible power gave Napoleon compelled other nations to follow the example of France, and in Europe voluntary enlistment has since survived in England alone, with a break during the Great War. From this period also dates the introduction of the short service and reserve system. Restricted under the treaty of Tilsit (1807) to 43,000 men with the colours, the Prussian strength was nevertheless annually added to by Schainhorst, who first developed the idea of sending the trained soldiers back to their homes at the end of the year, replacing them with fresh recruits, thus, while keeping the establishment within the required limits, producing a steadily growing reserve. In spite of this demonstration of strength the other powers did not at once accept the Prussian model. Finally, the lesson of Sadowa induced Austria to adopt it in 1868, and the events of 1870 and 1871 led to its establishment in S. Germany, Italy, and France. Now, in most nations will be found an army of reserve, intended to augment the standing army, or first fighting-line, from a peace to a war strength, and consisting of two classes—those waiting for an immediate call to arms if required, and those constituting the militia or second line of reserves—the entire effective military power of the state (see MILITIA, LANDWEHR, the latter dating from 1813). The principles of organisation were also modified in the large armies which took the field in the beginning of the century. In 1792, *mixed divisions*, composed of all arms, had been introduced, and in 1804 Napoleon organised, under his marshals, *corps d'armée*, each in itself a complete army. The Prussian model has been accepted as the best type of Army Corps (q.v.), and in that country originated also the territorial system now generally adopted by all European powers. A modern army, when mobilised, consists of several such corps and a mass of cavalry placed under one commander. A smaller force taking the field, consisting of one corps or less, is generally called an *expeditionary force*; this expression is also frequently used to designate the British regular army.

It may be convenient to mention here certain distinctions in the application of the word 'army.' A *Covering Army* is encamped or in cantonments for the protection of the different passes or roads which lead to the town or other place to be protected. A *Siege Army* is ranged around or in front of a fortified place, to capture it by a regular process of besieging. A *Blockading Army*, either independent or auxiliary to a siege army, is intended to prevent all ingress and egress at the streets or gates of a besieged place. An *Army of Observation* is posted to watch a doubtful neighbour country, such as the French force on the Italian frontier at the opening of the Great War, or a threatening enemy force at a distance. An *Army of Reconnaissance* has a special duty at a particular time and place, to ascertain the strength and position of the enemy's forces. A *Flying Column* is a small army carrying all its supplies with it, so as to be able to operate quickly, and in any direction, independently of its original *Base of Operations* (q.v.).

THE BRITISH ARMY.—The primitive national army of the English, as of other Teutonic nations, consisted of the mass of free landowners between the ages of sixteen and sixty; it was called in the Karolingian legislation by a form of the still existing name of *landwehr*, and known in England as the *fyrð*. Its term of service was fixed by custom at two months in the year. Its duties were to act within the limits of the kingdom to repel invasion, or within its counties to assist the shieff. The Conquest introduced the feudal system,

the kingdom being divided into some 60,000 *knight's fees*, which carried the obligation of forty days' service a year, at home or abroad. By the side of this cavalry force or feudal levy, the old *fyrde* or general levy continued to exist. But gradually the unfitness for foreign warfare of a composite force thus restricted in the time and place of its service compelled recourse to other methods. A *scutage* or fixed fine was substituted for personal service; mercenaries were raised by contract with a powerful baron or experienced captain; irregularities such as impressment and forced contributions, though declared illegal, were common from the reign of Edward III. to the time of the Stuarts. At this point the old general levy, or militia as it had come to be called, though unserviceable and disorganised, came into prominence as the chief potential factor in the Civil War. In spite of its uselessness, the question of its control was the principal cause of the war between Charles I. and the parliament; and the bitter feeling, when the king billeted his soldiers on the people and imposed martial law in time of peace, culminated in the presentation of the Petition of Rights (q.v.). In the event the militia was reorganised by statutes of 1662, which asserted the royal prerogative but transferred the chief powers to the lieutenants of counties, who retained them until they were revested in the crown in 1871. The British standing army dates not from 1661, but from 1645; not from Monk's regiment, but from the famous 'new model' which was established by act of the Long Parliament and maintained in substance until the Restoration. This army, which was modelled by Cromwell, consisted of some 80,000 men, mostly of the yeoman class, the most effective army, probably, that England has ever possessed; but the cost and the preponderating political influence of such a force produced finally a still deeper discontent. Consequently, on his restoration, Charles II. found himself at first compelled to agree to the abandonment of all the army except a kind of bodyguard or household brigade of 6000 men, sanctioned by the parliament. Monk's Coldstream regiment was retained, and the first regiment of guards was formed; the Earl of Oxford's Royal Regiment of Horse Guards (Oxford Blues) stood first upon the establishment, and two troops of cavalry raised by Charles formed the originals of the present Life Guards. The continuity of the Coldstream regiment's existence was practically unbroken by the ceremony of laying down its arms on Tower Hill and taking them up again; and this famous corps therefore forms the link that binds the 'new model' to the army of George V. In 1662 that famous corps now known as the Royal Scots, the representative of the Scots Brigade of Gustavus Adolphus, was brought over to England, and took its place at the head of the infantry of the line. The next regiments in order of precedence are the Queen's (Royal West Surrey) and the Buffs (the old Holland Regiment). Throughout Charles's reign the establishment grew, in spite of parliament's open jealousy of such an increase; and although the Commons by holding the purse virtually held the power, Charles's army numbered at his death 16,500 men. With Monmouth's rebellion as an excuse, James II. raised its strength to 20,000, some 13,000 of whom were kept in camp at Hounslow.

Although a few regiments were retained at the Restoration in 1660, it was only after the succession of William III. that, under the operation of the 'Bill of Rights,' the keeping up of a standing army was put on the legal footing which has been practically maintained ever since. The act opens with the words, 'Whereas the raising or keeping a standing army within the United Kingdom of

Great Britain and Ireland in time of peace, unless it be with the consent of parliament, is against law.' To punish certain offences against military discipline, which had hitherto been enforced by Articles of War emanating from the sovereign, the first Mutiny Act was passed in 1689, to last for six months only; but it was afterwards, with a few exceptions, annually renewed until its incorporation in the Army Discipline Act of 1879 (see ARMY DISCIPLINE). In 1691 the Commons sanctioned a vote of 65,000 men, but on the return of peace in 1697 this force was reduced to 19,000. During the Seven Years' War the strength of the army rose to 67,000 at home and on the Continent, with 37,000 in the plantations and garrisons abroad. Similarly, the war of American Independence caused a great increase; but on its conclusion in 1783 the numbers dropped to the 17,000 odd at home, at which they remained until the war of the French Revolution, 1793-94. From that time to 1815 the army experienced a more or less progressive development until the numbers reached over 250,000; but after Waterloo large reductions were made. During the Peninsular war the total strength of the British forces rose to over 800,000 men, including seamen and marines, militia and volunteers, and East India Company's troops. The elasticity which permitted these enlargements and contractions was obtained chiefly by raising additional battalions to existing regiments. During the half-century which followed the last date, the actual number of regiments varied but little. Five cavalry and thirty-five infantry regiments were added in the reigns of the first two Georges. Although a train of artillery had existed for some time previous, the present Royal Regiment of Artillery dates its corporate existence from 26th May 1716, when two companies were permanently established at Woolwich; horse and field artillery were not added until the end of the 18th and the commencement of the 19th centuries. The organisation of the Engineers as part of the military branch of the Ordnance was directed by an Order of Council dated 22d August 1717; but seventy years elapsed before privates were enlisted and that arm became a corps. It was also at first under the Board of Ordnance; and hence it is that the Artillery and Engineers are still called Ordnance Corps. The outbreak of the French Revolution found the service at a very low ebb. The laurels gained in the earlier wars of the century had been tarnished in America, where two British armies had surrendered; the ranks were largely filled with pardoned criminals and released debtors; and the system of billeting caused endless complaints from soldiers and civilians alike. In the Peninsula, the army was eventually organised in divisions, virtually grouped in army corps, and the commissariat and transport were brought to great perfection. But these services were afterwards reduced along with the army, which fell from 246,000 to 72,000, and the result was the miserable state of unpreparedness which was discovered when the strain of the Crimean war came.

After the Crimean and Indian Mutiny campaigns an impressive succession of events combined to excite in this country public interest in military concerns, to keep alive the sense of weakness inspired by our Crimean experience, and to point the way to a new order of things. The French campaign in Italy in 1859 afforded no new lessons of importance, but the Prussian concentration on the Rhine in the same year awoke attention. The commencement of the great civil war in America witnessed the commencement of the serious study of the art of war in England; the Staff College had been three years in existence. But what startled and electrified Europe was the success

of the Prussian army in the Seven Weeks' War (against Austria, 1866). Then was brought home for the first time the conviction that it was possible to have an army numerically small on the peace establishment, yet capable of expansion by means of a reserve at the shortest notice, and that a new system of tactics was necessitated by the introduction of breech-loading rifles. The events of the Franco-German war of 1870-71 hastened the transition from the old to the new order of things. The work was thereafter kept steadily in hand by the War Office, under successive ministries, both Liberal and Conservative. Mr (afterwards Lord) Cardwell began it in 1871, under Mr Gladstone; Colonel Stanley continued it during Lord Beaconsfield's administration; and Mr Childers, during Mr Gladstone's second tenure of office, completed a reorganisation by his measure of 1881.

It was Lord Cardwell who laid down the broad lines of the scheme of reconstruction. His policy comprised two principal objects: the creation of an adequate reserve capable of expanding an army relatively small in time of peace into a large and efficient force on the outbreak of war, and the closer union of the auxiliary with the regular forces. Before this could be accomplished some preliminary reforms were necessary—the admission of short as well as long service, the linking of regular battalions, the abolition of purchase of commissions by officers, and the localisation of the military forces. Hitherto there had been no true reserve composed of men immediately available for service with the first line abroad. Its foundation could only be laid, as the example of Prussia showed, under a system of short-service enlistment. In England ordinary enlistment had been for life, though Parliament favoured a policy of short periods, and in 1847 definitely prohibited all engagements except for 10 years, with re-engagement for 11. In 1867 the 10 years were increased to 12; a soldier might leave at the end of the 12 years, but if he continued he received extra pay, and by good conduct could earn a pension of 1s. 5d. a day for life on the completion of the full term. The Act of 1870 prescribed a period of 12 years, to be distributed between the colours and the reserve in such proportions as the Secretary of State might determine. Lord Cardwell himself fixed it at 6 years with each; at the same time he abolished the old bounties and added 1½d. a day to a soldier's net pay. This policy was completely successful. The reserves so created steadily increased and the system, which was tested in 1878 and 1882, gave striking proof of its value during the South African war, when it provided 80,000 reservists, of whom 96 per cent. were found efficient and enabled an army of 150,000 regulars to keep the field for 15 months. The establishment for 1910-11 was 138,000 of all ranks. The abolition of purchase by officers necessarily preceded the institution of linked battalions. It was required in order to enable officers to be placed on one list for promotion with those of the linked battalions. The proposal excited an opposition remarkable in view of the patent evils of purchase, and Mr Gladstone acted wisely though arbitrarily in ending the system by extra-parliamentary means in 1871. In 1873 the old regimental system was replaced by a universal double battalion organisation, and it now became possible without unnecessary expense to retain at home the men unfitted for foreign service by reason of age or youth, and to avoid the waste and congestion at the depôts abroad. There are now 69 regiments of infantry of the line, with a total before the Great War of 148 battalions, some few consisting of 4 battalions, and the remainder of 2. But the cardinal principle of the new policy was localisation. It was anticipated that this would encourage recruiting, and at the same time connect the army more

closely with the people and the land. When completed in 1881 the scheme showed the country divided into territorial districts, each comprising 2 battalions of the line and 2 militia battalions, together with the volunteer corps of the area. These troops formed administrative brigades with fixed depôts which served both as local centres for recruiting and as headquarters for the militia and permanent staff of volunteers. The two line battalions were linked together, one serving at home and the other abroad. These, as well as the affiliated militia and volunteer battalions, were renamed and renumbered by territorial districts. The exceptions were the former 60th (now King's Royal Rifle Corps) and the old Rifle Brigade, in each of which the first four battalions were regulars, and the Cameron Highlanders, which had but one line battalion. In place of the former regimental numbers, territorial designations were chosen, and each regiment recruits chiefly in the territory from which it takes its title, called the 'Regimental District.' The regimental districts take their number from the senior of the line battalions belonging to them, except in the case of the King's Royal Rifle Corps and Rifle Brigade; and as they have no numbers, this has led to their district being called the Rifle Depôt.

In 1907 came the next great period of army reform. The South African war and the series of royal commissions and committees which it provoked had abundantly illustrated the necessity for changes. A scheme of reorganisation was put forward in 1904, but did not secure general acceptance; and on assuming control of the War Office in 1906, Mr Haldane proceeded to reconstruct the entire military system with the aid of the newly created General Staff. The military forces of the country as he found them were broadly divided into three lines. In the first line was the regular army, composed of an army corps of 3 divisions at Aldershot, 6 other divisions, and 4 cavalry brigades: in all of these there were serious deficiencies and an absence of organisation for war. In the second line was the militia, which had been gradually brought into close dependence on the first line. Not only had the conditions of service been assimilated to those of the regular forces, but recruits were enlisted and trained by regular officers; facilities were freely granted to militia officers to obtain regular commissions, and bounties were offered to men on enlistment into the regular ranks. In these circumstances the militia was less a second line than an irregular addition to the first line. In the third line were the yeomanry and volunteers with every variety of organisation and training, and no assigned functions in peace or war. The 3 lines were uncoordinated, in different stages of training and discipline, and with no uniform system of command or even of armaments.

This organisation was completely remodelled, while at the same time the principles of the Cardwell system have been maintained and further developed. The new arrangement is of two lines closely connected, and each with a complete divisional organisation. The first line, or expeditionary force, was composed of 6 divisions, each of 3 infantry brigades of 4 battalions; 2 companies of mounted infantry; 2 field companies of engineers; 1 telegraph company; 1 transport and supply column; 3 field ambulances. Besides these there are 4 cavalry brigades, and also army troops, consisting of air squadrons, wireless, balloon, signalling, and other companies.

On mobilisation this force was raised to a total of 166,000 men by the addition of the reserve and the new special reserve. (See the articles MILITIA, RESERVE.) The question of the reserve and the provision of an expansive power for the regular

army outside its own limits was still in 1907 as in 1870 the crucial point of the army problem. Without the regular reserves not a single regular battalion sent from home could have taken the field in South Africa. But even for a short campaign some further draft-producing organisation was required. The militia as then constituted could not be compelled to serve abroad, and, further, was deficient in strength and unorganised for war. In practice its depleted battalions were invited to serve, and bravely accepted the duty. It was essential to assign to it some more definite function, and, after full consideration of the alternatives, it was decided to transform it both in name and in fact into a true reserve. As the special reserve it is in time of peace a part of the army reserve, and in time of war an integral part of the first line, supplying to it both drafts to replace wastage, and in some cases battalions for reinforcement in the field. The guiding principle throughout has been so to organise the military forces in time of peace that they can be rapidly and easily mobilised for war. The military history of the country exhibits a series of small wars, which cannot be reduced to any common denomination. The first line or expeditionary force is adapted to cope with them, or in its expanded form to wage war on a larger scale. The second line is filled by the Territorial Force, which represents the old yeomanry and volunteers. See VOLUNTEERS AND TERRITORIAL FORCE.

Recent developments of military policy have been no less striking in the sphere of imperial defence. The value of the services rendered to the mother-country by the Canadian and Australasian contingents during the South African war was gratefully recognised by all patriotic Britons, and called attention to an element of military power till then hardly realised by the empire. General plans of imperial defence have since then been under discussion at colonial congresses, and that of 1907 resulted in an agreement to organise the forces of the empire on a common basis. The labours of the Committee of Imperial Defence (q.v.) and of the General Staff advanced matters, and finally definite proposals were approved and ratified by the representatives of the overseas dominions at the Conference on Imperial Defence in 1909. The substance of the scheme is that the organisation, training, transport, and equipment of the available forces of the empire should be standardised, so as to become interchangeable. Each colony would provide troops for its local defence, but at the same time be prepared to give aid elsewhere on prearranged lines. Thus, while local autonomy was preserved, the various forces might, at need, be rapidly combined into a homogeneous imperial army. If to 7 divisions of regulars and 14 of Territorial Force at home, there were added the 9 of Indian, and a future 16 from the dominions and colonies, there would be a grand total of 46 divisions. The British army in France in the last year of the Great War stood at over 70 divisions. A unifying element was looked for in the General Staff (q.v.), which soon acquired an imperial character by the interchange of officers with colonial military staffs, all actively engaged in the study of imperial strategy and the formulation of war plans. It remained to create and organise the component forces, so that they could be readily concentrated anywhere. Meanwhile it is satisfactory to note an increasing tendency to keep the military problems of imperial defence outside the range of party warfare.

The cavalry was not included in the Cardwell reorganisation, but kept in single independent regiments. In 1893 it was divided into three corps—Dragoons, Lancers, and Hussars, with recruiting for each corps in general, and a draft-finding depot at Canterbury. In 1904

the Cardwell principle was applied, and 14 regiments abroad were linked with 14 regiments at home, which were given the duty of supplying drafts. In 1910 six new depôts were established, one in each command, to serve as mobilisation centres, and in time of war to produce reserve regiments and to train drafts. The South African war demonstrated the military value of mounted infantry. Every regular unit had a proportion of men who had been through a course of mounted infantry training, and in South Africa a staff was maintained as part of the garrison. But it is doubtful whether in future there will be any such. Yeomanry do the same work, and all cavalry are trained in dismounted combat. Yeomanry are not armed with the sword. It is estimated that on mobilisation about 150,000 horses would be required for military purposes. Steps were taken to institute an annual census of horses, and to organise machinery for their collection through the county associations. In the new method of training our cavalry, great importance is attached to scouting and reconnoitring, shooting, and fighting on foot. The weight carried by the horse was reduced, and, in opposition to the opinion of many cavalry officers, the lance was in many cases abolished.

The Indian army consists of Indian regular forces, the Hyderabad contingent, the Central India Horse, local corps, British volunteers, Indian army reservists, imperial service troops, and military police. The local corps are really police under military supervision, while the military police are under civil control. The imperial service troops are trained for service by certain feudatory chiefs under the superintendence of British officers. In the five years preceding 1909 a complete reorganisation of the Indian army was successfully carried out under the direction of Lord Kitchener, the commander-in-chief. The old presidential nomenclature was abolished, the regiments and units were renumbered, and a divisional organisation was introduced. On mobilisation India can now place in the field a force of 9 infantry divisions and 8 cavalry brigades, all complete with the necessary staff supply and transport. The troops are divided into two armies, a northern and a southern, numbering about 130,000 and 106,000 respectively, and they have been localised in large masses on the lines of railway: the artillery has been rearmed with quick-firing guns; and a staff college has been established at Quetta on the model of that at Camberley. The strength of our available military force in India before the Great War was:

British Regular Troops	75,250
Indian Regular Forces	158,000
British Volunteers	34,000
Indian Army Reservists	22,000
Imperial Service Troops	20,000
Local Corps	5,250
Military Police	28,340
	342,840

The spirit of reorganisation communicated itself from the mother-country to the overseas dominions, and they were soon largely engaged in increasing their military strength and adapting it to imperial needs on the lines laid down by agreement with the General Staff. The Great War effectually drew them out of the stage of transition. Canada soon had a permanent force of regulars who act as instructors, with an establishment of 5000 and a strength of over 3000. There is also an Active Militia and a Reserve Militia. By the act of 1904 all males between the ages of 18 and 60 are liable for service in the Active Militia. It was composed of 3100 mounted troops, 2000 artillery, and 35,000 infantry, or an approximate total peace strength of 3000 officers and 41,000 men. On mobilisation it was expected to reach a total of 100,000. A royal mili-

tary college has been established at Kingston. The Australian Commonwealth had a permanent force of about 1300, and citizen forces of 15,500 militia and 5000 volunteers. The troops were also divided into the Garrison Force and the Field Force. There were in addition some 43,000 members of rifle clubs and 18,600 cadets. A Defence Bill enforcing compulsory service was reshaped, so as to secure general acceptance, but the existing acts of 1903-4 already imposed a liability to serve in time of war on all between 18 and 60; yet Australia rejected compulsion during the Great War. The number of males between those ages was 1,161,000. It is proposed to organise the forces so that they may be capable of easy expansion. A military college has been established at Sydney. New Zealand had a force of approximately 20,000, out of a white population of less than one million. The Defence Act of 1908 authorises the raising of a militia for all males between the ages of 17 and 55. This might be used to create a force of at least 150,000. In South Africa, apart from the British garrison of 11,493, there were the following available troops: Cape, 611 Mounted Rifles, 5466 volunteers, 1265 Mounted Police; Natal, 2739 militia, 1006 Mounted Police, 6567 members of rifle associations, 3487 cadets; Transvaal, 10,000 volunteers, 4000 cadets. All of these forces overseas proved their power of expansion by huge increases during the Great War. There are also various permanent forces maintained at particular stations, the provision for which is voted by the Imperial Parliament. Malta has a garrison, which includes the local Royal Malta Artillery. There are two battalions of Royal Artillery, distributed as local companies at Ceylon, Mauritius, Hong-kong, and Singapore; two battalions of the W. Indian Regiment; and the W. African Regiment.

Since the Egyptian troubles of 1882, there had been an English army of occupation of over 4000. The numbers had usually been 6037 of all ranks, and to their upkeep the government of Egypt made an annual contribution of £150,000. The native Egyptian army, though officered in the senior ranks by English officers, was totally distinct, and in 1882 was entirely reorganised under a British general, as Sirdar. The extraordinary success of this reorganisation was shown by the series of brilliant campaigns, ending in the reconquest of the Sudan and the death of Mahdism. It took no part in the fighting of the Great War.

There has been a constant endeavour in recent years to improve the food, clothing, housing, and general conditions of the soldier's life, so as to bring them more into conformity with modern economic standards. It is satisfactory to note that the progress has been moral as well as material. Crime in the ranks tends to decrease, and the average stamp of recruit is undoubtedly of a higher type. Since 1906 enlistment has been for an elastic period—in the case of infantry of the line usually for 7 years, and part of an eighth if the man is serving abroad. Gratuities are granted to those leaving the colours, and after 21 years' service a pension may be obtained. The problem of the time-expired soldier has also received much attention. Under a short-service system the army is for many only a temporary career, to be followed by a return to civil employment. Their prospects have been greatly improved by various recent measures, such as the institution of a system of trade-training with the colours and the keeping of registers of civil employment at all district headquarters. Certain occupations in the post-office, police force, and other departments are expressly reserved for them, and valuable work is also performed by various private agencies and institutes. It was arranged to allot to the county associations im-

portant duties in connection with the care of reservists and discharged soldiers.

The great distinction between the British army and that of nearly every other state in Europe is that the service is voluntary. The subjects of the crown engage by free choice to serve in the army and reserve. The only form of compulsory service—and that is in abeyance—is the ballot for service in the militia; this, though still on the statute-book, has not been enforced since 1831.

The number of men provided for has varied considerably in recent years. The average strength of the regular army at home and abroad was 209,221 in 1890, 220,309 in 1895, rose to 450,000 in 1901-2 during the South African war, and dropped to 235,761 in 1903-4. The establishment of the regular army for 1910-11 was 255,438. Of this number 184,200 were serving at home, 45,215 in the Colonies and Egypt, and 75,884 in India. The composition of the home forces was as follows.

Cavalry	14,702
Horse and Field Artillery	19,185
Garrison Artillery	13,896
Engineers	9,610
Infantry	96,182
Army Service Corps	6,696
Army Medical Corps	4,637
Colonial and Native Indian Corps	8,780
Departmental Corps	3,405
Additional	1,870
Permanent Staff, &c.	2,857
Staffs and Departments	1,152
Miscellaneous	1,443
	184,200

The strength of the Special Reserve in March 1910 was 69,341, and of the Territorial Force 276,618, of all ranks. All categories increased greatly during the Great War, the total rising to over 5 millions. On peace arriving, steps were taken for reduction to the pre-war figure.

FOREIGN ARMIES.—Nations have tried at various times a number of experiments in the kind of armies they support, as distinguished from the strength of them. Roughly speaking, there are three different kinds, which may be, however, and often are, found in combination in a single country. There is, first, the regular or standing army, composed either entirely of men who make the army a life career, or of men who enlist for a spell with the colours, followed by service in a reserve. Here every man becomes a fully trained soldier before leaving the colours. The second type may be called the militia system, under which a man does only a short continuous training, and is called up at intervals for a few weeks of camp. The third type corresponds to British territorials, who have no first spell of continuous training, but do throughout the year a fixed number of drills. Herewith are given a few facts and statistics of the armies of foreign nations before the Great War, further details being given in relevant sections of the articles on the several countries.

Germany.—By the imperial constitution of 1871, the Prussian obligation to serve in the army was extended to the whole empire. The service in the standing army was 7 years, 3 with the colours in the cavalry or horse artillery, and 2 in all the other branches, and the remainder with the active reserve. After quitting the active reserve, the soldier passed 5 years in the landwehr and 7 in the reserve, remaining till his 39th year in its second levy, and concluding with 6 years in the landsturm. 'One-year volunteers' were passed into the reserve at the end of their first year, on condition of passing certain examinations, and bearing the expense of their clothing, equipment, &c. for the year. In the German organisation the territorial system was carried out thoroughly. The army consisted in

1914 of 26 'first-line' army corps, and comprised a peace strength of nearly 800,000 rank and file, exclusive of one-year volunteers and extra-recruits. The corps districts were divided into divisional and brigade districts, which were again subdivided into landwehr battalion districts, and these in turn into company districts, so that every village had its definite place. Each line regiment (3 battalions) drew its recruits from an allotted district, and passed its time-expired men into the landwehr regiment (2 battalions) of the same district. After the exemptions common to all countries had been granted, the ballot allowed a margin of about 10 per cent., those who drew the fortunate numbers passing at once into the Ersatz reserve, which received no training in peace-time, but would be called on to replace casualties in the field. The military strength upon mobilisation was estimated at a total of 4,200,000 trained men.

France.—A law passed in 1872 enacted that every Frenchman, with a few specified exceptions, unless serving in the navy, was liable to personal service in the army, and forbade substitution. The period of liability under a law of 1905 extends to 2 years in the active army, increased to 3 years in 1912; 11 years in the reserve of the active army; 6 years in the territorial army; and 6 years in the reserve of the territorial army. In 1909 the effectives with the colours were estimated at 22,000 officers and about 600,000 men. The forces were organised into 21 army corps in 1912, exclusive of the Paris and Tunis garrisons. The infantry of the active army consisted of about 376,000 men, the cavalry of 67,300, and the artillery (which was reorganised in 1912) of 98,500; the other arms numbered about 60,000. It is estimated that the French army, with its various reserve and territorial forces, included 3,500,000 men on a war footing, and that 4,000,000 untrained men might be embodied, all of whom were needed in the Great War. The French colonial army comprised 6 brigades of infantry, 12 batteries of field artillery, 6 mountain batteries, and 12 garrison batteries. There were also forces in Madagascar, W. Africa, and Martinique, and in Indo-China some 34,000 infantry.

Austria.—The military forces of the Austro-Hungarian monarchy were divided into the standing army, the landwehr, and the landsturm. All subjects were liable to service, and those exempted on physical grounds paid a fine proportionate to their means. In principle every qualified man throughout the monarchy was liable from his nineteenth year, and must serve 3 years with the colours, 7 in the reserve, 2 in the reserve of the landwehr, and then till his 42d birthday in the landsturm, from which, in time of war, men might be drafted into the landwehr; men who had passed through the regular army were liable for service in the landsturm as officers or non-commissioned officers till the age of sixty. In practice, however, financial considerations caused the division of recruits into three classes: about 95,000 annually formed the first class, trained as above; nearly 10,000 were drawn to supply the Ersatz reserve; and all the remainder passed at once into the landwehr, there to serve their twelve years. The standing army was under the control of the Minister of War for the monarchy, while the landwehr was controlled by the Austrian and Hungarian Ministers of National Defence. This common or active army comprised 468 battalions of infantry, 252 squadrons of cavalry, and proportionate artillery, which was frequently increased. It was organised in 16 army corps, with 6 cavalry divisions and 34 infantry divisions, to each of which was attached a corresponding landwehr division. The peace strength was 472,000 officers and men, and the war strength about 4,320,000.

Russia.—Universal liability to service was first

established in 1870, but, although prohibited, the purchase of exemption was commonly permitted. The period of service was 4 years in the active army (one on furlough), 14 years in the reserve, and 5 in the Opoltschenie or militia. The Russian military forces were composed of regular and irregular troops, and militia, only called out to repel invasion. Every man not included in the army or reserve belonged to the militia up to his 43d year. The country was divided into 13 military districts, with sub-districts and 'circles,' as in Germany. The irregular troops were supplied by the Cossacks, who gave military service in lieu of taxes, and comprised about 150,000 men, chiefly cavalry. There were 29 army corps in Europe, 3 in the Caucasus, 2 in Turkestan, and 5 in Siberia. The peace strength was about 1,300,000. At the outbreak of the Great War in 1914, the war strength of the Russian active army was about 67,800 officers and 3,426,000 men. The total war strength was estimated at nearly 6,000,000.

Italy.—The Sardinian law of conscription forms the basis of the Italian military system, and all are liable from 20 to 40. Substitution is allowed in the case of brothers, and one-year volunteers are accepted. Contingents were divided by lot into three classes, one going to the permanent army, a second enjoying unlimited furlough, and the third passing to the militia. In practice the soldier passed 2 years in the ranks, then 6 in the reserve on furlough, 4 years in the mobile militia, and 7 in the territorial militia. There were 12 army corps, and under the reorganisation of 1909 there should be 344 battalions of infantry, 145 squadrons of cavalry, and 24 regiments of field artillery. The war strength of the forces was given as over 3 millions, with some three-quarters of a million in first line, but all outside the latter were little trained or not at all.

United States.—At the commencement of 1861 the United States army consisted of only about 14,000 regular troops. In various successive levies by the president during the civil war (1861-65), as many as 2,653,062 men had been called out—nearly one-fourth of the entire population of the Northern States. After the war the standing army was steadily diminished; a law passed in June 1874 provided that the army at no time might exceed 25,000 enlisted men. During the war with Spain, however, 219,035 volunteers were enrolled, and the regular army aggregated 55,682; total, 274,717. And by the Reorganisation Bill of 1901, the maximum enlisted force was increased to 100,000 men. The authorised establishment, being fixed at 100,000, was reduced to 80,000 for 1910. The organised militia was contributed by the various states, and was then in a state of transition; by a law of 1908 it was reconstituted on the lines of the regular army and made liable for service abroad. When the United States entered the Great War it adopted conscription, and had at once a possible of 14 millions of recruits. These were called up a million at a time, and when fairly trained were shipped to Europe at the rate of 30,000 a week in British ships.

Japan.—The military development of Japan falls into three periods—the feudal, from which she emerged in 1873; the period of foreign tutelage, which ended with the China-Japanese war of 1894; and the present, in which she possesses an effective and mobile modern army, admirably equipped from her own arsenals and manufacturing establishments. The army, which was victorious over Russia in 1904, had been organised on the German model, with the aid of highly skilled German officers, and was largely increased. Service is compulsory on all males between the ages of 17 and 40, but actual service does not begin till 20. Each man serves 3 years (2 for infantry) with the colours out of a total of 7½ passed in the standing army and its

reserve, followed by 10 years in the second reserve and 2½ years in the territorial army. The establishment of the standing army was raised to 600,000, with total war strength nearly 2 millions.

China.—Under a progressive scheme of reorganisation, instituted in 1905, the Chinese military forces were acquiring consistency and unity. There were to be a first line and reserves, and ultimately it was proposed to create 37 divisions of all arms, with a strength of 28,000 officers and 430,000 men. Service was voluntary, and training was conducted by Japanese officers; but political disturbances, amounting to civil war, ruined national organisations.

Of the other military powers of the world the following were the conditions of service and the approximate strength in 1909:

Belgium, voluntary—peace establishment 43,000, but strength much less; war 169,000.

Denmark, national militia—peace 13,830; war stated to be 120,000.

Greece, compulsory service from 19 to 55—peace 30,000; war 70,000, intended ultimately to be 200,000.

Netherlands, militia, part voluntary, part compulsory, under new military system—peace 64,000; war 157,000; army of Dutch East Indies 40,000.

Norway, national militia, compulsory from 18 to 50—peace 30,000; war, nominal, 150,000.

Portugal, conscription—peace 31,000; war 250,000.

Spain, conscription, reorganisation of 1907—effective of 80,000, and total armed strength of 500,000.

Sweden, militia, part voluntary, part compulsory, under scheme of reorganisation begun in 1901—peace 64,000; war 450,000, rising to 600,000 in 1914.

Switzerland, national militia, universal and compulsory from 17 to 43—205,000 and 300,000 landsturm.

Turkey, being reorganised under the direction of German officers, probable strength nearly 1,000,000.

Bulgaria, universal and compulsory from 18 to 46—peace 58,000; war 400,000, out of a population of 4,500,000.

Montenegro, tribal militia, nominal war strength 50,000.

Rumania, universal and compulsory from 21 to 46—peace 90,000; war stated as 550,000.

Serbia, universal and compulsory from 18 to 50—peace average 25,000; war, potential, 300,000.

Argentine Republic, war 250,000.

Brazil, peace 30,000; war 50,000.

Chile, 94,000.

Mexico, nominal war strength 84,500, to be increased to 250,000.

Persia, after the Great War, a small growing regular army under British officers, and a cavalry and infantry militia.

Siam, universal training, standing force 6000.

ARMY ADMINISTRATION.—The whole of the operations connected with the raising, clothing, paying, maintaining, and controlling of an army are included in the term army administration. The sovereign has the supreme command of the British army, and controls it in every way through the Secretary of State for War, who is responsible to parliament for his own acts and for the advice he gives. This Secretary is the head of the War Office (q.v.), and is assisted by two under-secretaries, one permanent, the other parliamentary, but sitting in a different House from his chief. The sovereign's orders affecting organisation, entry into and retirement from the service, promotion, alterations in conditions of service, or, in fine, any fundamental matter of agreement between the sovereign and the soldier, are communicated by 'Royal Warrants' signed by the Permanent Under-Secretary for War, and published when necessary. These warrants are previously published in the 'Army Circulars,' a monthly issue of orders (signed

by the same functionary) dealing with minute details of allowances, supplies, arms and stores, of all kinds—in fact, any expenditure of money or material. Army Circulars are supplementary to the 'Revised Army Regulations,' and are incorporated in those books when a new edition is published. Orders connected with the *personnel* of the army, and not involving expenditure, such as training, discipline, medals, rewards, special promotions, &c., are published in monthly pamphlets called 'Army Orders,' signed by the adjutant-general of the army. They are supplementary to the 'King's Regulations and Orders for the Army.' By the 'Army Regulations' and the 'King's Regulations,' everything connected with army administration is determined.

In 1895, on the retirement of the Duke of Cambridge from the post of commander-in-chief, a partial reorganisation of the War Office was carried through, by which the subordination of commander-in-chief (as well as of adjutant-general, quartermaster-general, director of artillery, and inspector of fortifications) to the Secretary of State was clearly defined. The War Office continued to be the medium through which the Secretary of State exercised his functions as administrator of the military system and minister responsible to the crown for the efficiency of the forces. Till 1904 he was advised principally by the commander-in-chief, who exercised general command over the military forces at home and abroad, issued army orders, held periodical inspections, and controlled the military department of the army. The commander-in-chief was assisted by the adjutant-general, the director-general of mobilisation and military intelligence, the military secretary, the quartermaster-general, and the inspector-general of fortifications, director-general of ordnance, and the director-general of the army medical department. The financial secretary reviews and supervises the expenditure generally, and advises the Secretary of State on questions of army expenditure.

A more fundamental reorganisation of the War Office was effected on the recommendations of a committee presided over by Lord Esher, which presented its report in three successive parts in January, February, and March 1905. Among the reforms insisted on were the immediate creation of an Army Council of seven members, with defined duties; the abolition of the office of commander-in-chief; the appointment of an Inspector-general of the Forces; and the strengthening of the already existing Committee of Defence. All the members of the new Army Council were appointed, and the office of commander-in-chief ceased to exist within fourteen days of the issue of the report. The prerogative powers of the crown, previously exercised by the Secretary of State and other principal officers, were now vested in the Army Council. The designation of the members and the distribution of duties is as follows: (a) Secretary of State (the minister responsible to the crown and parliament for all the business of the council); (b) 1st Military Member, the Chief of the Imperial General Staff, controls the General Staff (q.v.), directs military policy in all its branches, mobilisation, and operations of war, intelligence, training, manœuvres, and the higher education of officers; (c) 2d Military Member, the Adjutant-general, *personnel* (recruiting and discipline), rewards, peace regulations; (d) 3d Military Member, the Quartermaster-general, supplies, remounts, transport; (e) 4th Military Member, the Master-general of Ordnance, armament, fortifications, and ammunition; (f) Civil Member, the Parliamentary Under-Secretary of State, civil business other than finance, and the Territorial Force; (g) Financial Member, the Financial Secretary, estimates, loans, expenditure, accounts and audit; (h) Surveyor-general of Supply,

contracts and the provision of stores in bulk; and two permanent secretaries. The Committee of Imperial Defence represents the previous Committee of Defence (originally a committee of the cabinet only), the Joint Naval and Military Defence Committee, and the Colonial Defence Committee, which it superseded in accordance with the recommendations made by Lord Esher and his colleagues. Its functions are advisory only, and it has no executive powers. A permanent nucleus is provided through the secretary, who is appointed for five years, and the two assistant-secretaries, who are appointed by the Admiralty and War Office for three years. Their duties are to consider all questions of imperial defence, from the point of view of the navy, the military forces, India, and the Colonies; to obtain and collate information from the Admiralty, War Office, India Office, Colonial Office, and other departments of state; to prepare any documents required by the Prime-minister and the Defence Committee, anticipating their needs as far as possible; to furnish such advice as the committee may ask for in regard to defence questions involving more than one department of state; and to keep adequate records for the use of the cabinet of the day and of its successors. By these means the government of the day is enabled to coordinate the work of the army and navy and to maintain a continuity of policy. The committee itself is a fluctuating body, but normally consists of the Prime-minister, 4 Secretaries of State, 1st Lord of the Admiralty, Chancellor of the Exchequer, 1st Sea Lord and Director of Naval Intelligence, Chief of Imperial General Staff and Director of Military Operations, together with other persons specially qualified to give assistance of a permanent or temporary nature according to the particular problems under discussion. The responsibility for policy rests with the Prime-minister. The committee holds frequent meetings, and in 1909 it held consultations with the representatives of the dominions who attended the Imperial Defence Conference. Lord Esher's committee further advised the appointment of an Inspector-general of the Forces. His duties consist of reviewing and reporting upon the practical results of the policy of the Army Council within the financial limits laid down by the cabinet. His field of action covers the whole United Kingdom and those portions of the empire where troops under the control of the home government are stationed. He must form a judgment, either personally or through his staff, on the efficiency of officers and men, on the handling of troops, on the standard and system of training, on the suitability of equipment, and generally on all that affects the readiness of the forces for war. Directly under him as part of his staff are inspectors of horse and field artillery, garrison artillery, engineers, and medical services, and a staff-officer for cavalry.

The business of the War Office is mainly conducted through a series of permanent committees and boards. In addition to the Army Council, which controls the general administration of the army, there is the Imperial General Staff, organised under orders of 1906 and 1909, with a central establishment at the War Office of 65 specially qualified officers, appointed for four years to study strategy, plan campaigns, collect intelligence, and thereby promote continuity of policy and uniformity of principles throughout the empire. The General Staff in commands and districts further assists in seeing that the prescribed policy is carried out and that military efficiency is secured. The Selection Board, composed of the military members of the Army Council, the Inspector-general, and four general officers commanding in chief, selects for commands and for special promotion. The Terri-

torial Force is represented by an Advisory Council, with the Parliamentary Under-secretary as president and the Director-general of the Territorial Force as vice-president, and a number of specially qualified officers and other persons. Among other committees may be mentioned those on Aeronautics, Military Education, Mechanical Transport, Mobilisation, and Spiritual and Moral Welfare of the Army.

ARMY AGENT, a person appointed by government to receive the pay of army officers and to act as their banker. Regimental officers draw their pay monthly in advance, staff and departmental officers in arrears, from the agent, who receives it from government when due, and depends for remuneration on the officers' private banking business and the use of their pay for the month. Every regiment has an agent named in the *Army List*.

ARMY CORPS, a miniature army composed of all arms of the service, under the command of a field-marshal or general, and complete with every requisite appliance for war. The strength almost universally throughout Europe is from 30,000 to 40,000 men. After the South African war an organisation of the British army in army corps was partially effected, but Lord Esher's committee condemned the system, and it was finally abandoned in 1907 as unsuitable to the military needs of the empire.

ARMY DISCIPLINE is maintained by the administration of military law as consolidated in the Army Act of 1881, which incorporates the main provisions of the Mutiny Act (q.v.), and the Articles of War (q.v.), and is brought into force, and amended, if necessary, each year by the Army Annual Act. This last act also specifies the number of men to be maintained, and the price to be paid in billets during the ensuing year; it must be passed before the 30th April, on which date the previous act lapses. Military law is regulated by the Rules of Procedure and King's Regulations, and by it the soldier is governed in peace and in war, at all times and in all places. It provides for minor breaches of discipline by the power of summary punishment (with a maximum of twenty-eight days' detention) vested in every commanding officer, and for graver offences by the constitution of courts-martial with powers of sentence varying, according to the rank and number of the officers composing them, from forty-two days' imprisonment to penal servitude and death. The punishment of detention was introduced in 1906 to relieve soldiers guilty of minor offences from the stigma and military consequences of imprisonment. On the abolition of flogging, aggravated offences on active service were made subject to 'field punishment' in accordance with rules laid down, and the power to award this was later extended to all officers on active service. There is no appeal from the sentence of a commanding officer, but in most cases a soldier has the option of being tried by a court-martial. The sentence of a court-martial requires first to be confirmed by a prescribed authority. From it there is strictly no appeal, but it may be mitigated or remitted by His Majesty or an authorised officer.

ARMY ESTIMATES.—Early each year the War Office sends to the Treasury a series of accounts, setting forth the probable cost of everything required for the period from April 1 to March 31 following. These accounts are called the Army Estimates. In preparing them the Secretary of State for War applies to the heads of all the departments under him for detailed accounts of their probable requirements, submits them to the Treasury, and, if approved, to the House of Commons.

In the United States annual reports are forwarded by heads of departments to the Secretary of War, and are referred by the president to congress,

whose duty it is to examine the details of the estimate, and appropriate from the public funds the sum voted.

ARMY LIST, a list issued monthly, by authority of the War Office, of all commissioned and warrant officers of the British army, including the Royal Marines, the Indian army, the Special Reserve, Territorial Force, and Officers' Training Corps, whether on full or half pay; together with a list of the headquarters staff at the War Office, and of the staff of each general officer's command at home, in India, and in the Crown Colonies, and of the various educational, manufacturing, and other establishments, the members of Territorial Force county associations, and other information. A full index, an obituary, a list of the changes gazetted during the past month, and of the last issue of royal warrants, army circulars, and general orders, complete the work. A similar but larger volume is issued quarterly by the War Office, in which, besides the lists of each regiment, the officers of the army are also arranged on a seniority list, with the dates of their commissions and birth, and an account of their war services.

In the United States a similar annual publication, the *Official Army Register*, is issued by order of the Secretary of War, and includes a list of the officers, with notices of their services.

ARMY MEDICAL SERVICE.—In the British army, lieutenant is the grade in which an officer enters the Royal Army Medical Corps on probation, becoming later a captain. After twelve years' service, three abroad, he becomes a major, and then lieutenant-colonel at twenty-five years' service, eight abroad; then in succession colonel and major-general. A captain or lieutenant would be attached to every regiment or battalion on active service, and majors would have charge of the field-hospitals and bearer-companies. In peace-time officers of the Royal Army Medical Corps are not as a rule attached to units, but have medical charge of several regiments, or of the district hospital. There are also dental surgeons—lieutenants, captains, and majors.

On active service, every battalion, battery, cavalry regiment, or other unit would have a medical officer from the Royal Army Medical Corps attached, assisted by a corporal and four privates from the same corps. The battalion itself provides 16 stretcher-bearers and a squad trained in sanitary duties to act as sanitary police. Other units have a similar proportionate organisation. In the field there would be a medical *personnel* of 384 of all ranks to each cavalry division, and 700 to each infantry division, but varying greatly with the nature of climate and campaign. The total strength for 1910-11 was 4637, increased thirtyfold in the Great War. The duties of medical officers include training stretcher-bearers and sanitary police, purifying the water-supply, and preventing disease. The collection and removal of the sick and wounded from the battlefield is carried out by field-ambulances, which both give first-aid and act as temporary hospitals. There are 3 to each division and 1 to each mounted brigade. The infantry field-ambulance has a *personnel* of 10 officers and 220 rank and file with drivers and transport, and provides for 150 patients. The link between the field-ambulances of a division and the hospitals at the base is provided by a special mobile unit, the clearing hospital, with a *personnel* of 85 and provision for 200 patients. Stationary hospitals along the routes of evacuation are furnished with 200 beds each, and general hospitals at the base with 520 beds. This department also includes convalescent depots, ambulance-trains, and hospital-ships. The Queen Alexandra Imperial Nursing Service has also been reorganised; it comprises a matron-in-chief, matrons,

sisters, staff-nurses, and orderlies. The medical department of the Indian army is separately organised.

ARMY PAY DEPARTMENT.—This department was, on the recommendation of Lord Esher's committee, absorbed into a new Army Accounts Department. The financial secretary is its representative at the War Office, and is responsible for the preparation of the army estimates. In 1910 the department was divided, the audit duties being retransferred to the War Office, and an Army Pay Department being constituted for army pay services. The directing staff are classified as command accountants, group accountants, and accountants. The officers of the Army Pay Department retain their military rank and titles, and are classified as chief paymaster, staff paymasters, paymasters. The duties of the Accounts Department comprise the issue and pay of allowances, the receipt and disbursement of all money for military purposes, examination and audit of all military accounts, and advising the major-general in charge of administration (see STAFF) on all questions connected with finance. In each command there is an audit office under the immediate charge of the chief accountant, with three accountants as deputy, for district services, and as cashier respectively; and there are offices under accountants at convenient centres for regimental services. The regimental pay master no longer exists.

ARMY SCHOOLS comprise only those for the school-tuition of soldiers and their children. Under **MILITARY SCHOOLS** will be found the Staff College, the School of Military Engineering at Chatham, the School of Musketry at Hythe, Garrison Classes, and the Royal Military College at Sandhurst. Under **ARTILLERY**, the Royal Military Academy, the Artillery College, and the Department of Artillery Studies, all at Woolwich, with the School of Gunnery at Shoeburyness, are alluded to. Chelsea Hospital is an asylum for veterans, not a school of instruction. The Duke of York's Royal Military School (now at Dover), and the Queen Victoria School at Dunblane, are orphanages for soldiers' children, not necessarily involving a military career for them. The Royal Hibernian School was abolished in 1924. In 1920 the inspectors of army schools and soldiers of the Corps of Army Schoolmasters were transferred to the new Army Educational Corps. Appointments (from September 1923) are made by a Board of Selection, consisting of the Deputy Director of Staff Duties (Education), two members nominated by the Chief of the Imperial General Staff, and two by the President of the Board of Education. Candidates for commissioned rank are required to undergo a year's course at an army school of education, and obtain at the end of it a diploma in education. For this course (in general) they are selected after an interview from commissioned officers of not less than one year's service who hold a university honours degree, and from warrant officers of the Army Educational Corps who pass an examination. Candidates for non-commissioned rank may be serving soldiers holding a special army certificate, or civilians holding an equivalent certificate. They will be required to undergo a course of two terms at an army school of education; but certificated teachers and certain others are normally exempt. All appointments are subject to a year's probation.

Recruits are examined after enlisting, and are classified. All non-commissioned officers and men must attend school till they obtain a second-class certificate of education, without which they are not promoted to sergeant's rank; while a first-class certificate is required before a soldier can be recommended for a commission. Where there are no facilities for attending civilian schools, soldiers'

children are taught by members of the Army Educational Corps, and by army schoolmistresses.

The ROYAL ARMY SERVICE CORPS, which has under its care the transport and supply departments, will be found described in the article COMMISSARIAT.

The ROYAL ARMY ORDNANCE CORPS, under the Master-general of the Ordnance, is charged with the providing, care of, and issuing of all military stores, ammunition, clothing, telegraph, telephone, and wireless apparatus, and countless other field necessities. The corps consists of a major-general, and four classes of subordinate officers, of whom there were about 120 before the Great War, in command of some 1600 warrant officers, non-commissioned officers, and rank and file, distributed in companies. In the war the corps increased about twenty times.

Amongst the numerous articles on military subjects in this work will be found—

Army-worm, a name applied to the larva of a small fly (*Sciara militaris*) occurring in northern Europe and in the United States. The maggots collect in millions, in bands many feet in length, six inches or so in breadth. The name is also applied to the caterpillars of *Leucania unipuncta*, which do great harm to grass and corn in the United States, and migrate in great bands in search of food and for other reasons.

Arnaboldi, ALESSANDRO (1827-98), Italian lyric poet, born at Milan, studied law at Pavia, and was till 1873 an official of the commune of Milan. Thereafter he lived in retirement in the neighbourhood, and gave himself up to literature. By his first collection of *Versi* (1872) he at once gained the reputation of a great poet, but failed to retain it. He published also *Nuovi Versi* (1888).

Arnal, ÉTIENNE (1794-1872), French actor, born at Meulan (Seine-et-Oise), was a soldier and button-maker before he took to the stage. Unsuccessful in tragedy, he made his name in comic parts, and acted near half-a-century in the Vaudeville and other Paris theatres. He published some verse.

Arnaldus Villanovanus, or DE VILLA NOVA, an alchemist, physician, and astrologer, probably of Spanish origin, may have been born about 1235. He lived in Aragon, Paris, and Sicily, and died in 1313 on his way to Avignon to treat Clement IV., who had sent for him. He wrote on medicine, alchemy, and religion, and was suspected of heresy.

Arnason, JON (1819-88), 'the Grimm of Iceland', born at Reykjavik, was long national librarian. His great collection of Icelandic legends (1862-64) has been translated by Powell and Magnusson (1864-66).

Arnau, a town of Bohemia, on the Elbe, 17 miles NE. of Gitschin, has an interesting old Rathaus and important linen industries: pop. 5000.

Arnaud, ARSÈNE. See CLARETIE (JULES)

Arnaud, FRANÇOIS THOMAS MARIE DE BACULARD D', French writer, was born in Paris, 15th

September 1718. He early attracted Voltaire's attention. In 1748-50 he corresponded with Friederick the Great, who called him to Berlin in 1750, designated him Voltaire's successor, and otherwise showed such favour as to excite the jealousy and active hostility of Voltaire. After some stay in Dresden, he returned to Paris in 1755. Besides tragedies and poems, he wrote a long series of romances which were admired by Rousseau, and were very popular in their time. His later life was spent in poverty. He was imprisoned during the Terror; and died in Paris, 9th November 1803.

Arnaud, HENRI (1641-1721), pastor and military leader of the Waldenses, wrote in exile at Schonberg his famous *Histoire de la Rentree des Vaudois dans leurs Vallées* (1710).

Arnaud, ST. See ST ARNAUD.

Arnauld, ANTOINE (1560-1619), the greatest advocate of his time in France, won a wide celebrity by his zealous defence of the university of Paris against the Jesuits in 1594.—His eldest son, ROBERT ARNAULD D'ANDILLY (1588-1674), quitted the world for Port-Royal des Champs, and published translations of Josephus, Augustine, and St Teresa.—The advocate's twentieth son, ANTOINE (1612-94), 'the great Arnauld', studied at the Sorbonne, became doctor and priest, and, living mostly in seclusion, became famous for his brilliant controversial writings, mainly against the Jesuits and in defence of the Jansenists. He became the religious director of the nuns of Port-Royal des Champs, the convent of which his sister was abbess. Here he and his friends, Pascal (q.v.), Nicole, and other 'Port-Royalists' living near him, produced many books, including treatises on grammar, geometry, and logic. He also wrote in defence of transubstantiation and against Calvinism. Under Jesuit influence, the king issued an order for his arrest. Arnauld hid himself for some time, but finally withdrew to Brussels, where he died. His works were published in 45 vols. (1775-83).—His sister, MARIE-ANGÉLIQUE (1591-1661), was made abbess of Port-Royal at eleven, ultimately reformed the convent by her holy example and severe discipline, resigned, and returned to be prioress under her sister Agnes (1593-1671).—Their niece, la Mère ANGÉLIQUE (1624-84), the daughter of Robert, became a nun at Port-Royal, was successively subprioress and abbess; and during the persecution of the Port-Royalists, sustained by her heroic courage the spirits of the sisterhood and their friends. See books by F. Martin (1873) and A.K.H. (1905), and Sainte-Beuve's *Port-Royal* (4th ed. 6 vols. 1878).

Arnault, ANTOINE VINCENT (1766-1834), was born in Paris, suffered four years' exile as an Imperialist (1815-19), and died secretary of the Academy. A rigid classicist, he produced seven dramas—the best *Les Vénitiens* (1799), but all inferior to his *Fables et Poésies* (1812), and *Souvenirs d'un Seigneure* (1833).

Arndt, ERNST MORITZ, German poet and patriot, was born in the then Swedish island of Rügen, 26th December 1769. The son of a former serf, he was trained with a view to the church at Stralsund, Greifswald, and Jena; but in 1805 he became professor of History at Greifswald. His history of serfdom in Pommern and Rügen (1803) led to its abolition; and in his *Geist der Zeit* (1807) he attacked Napoleon with such boldness that, after the battle of Jena, he had to take refuge in Stockholm. He was able to resume his functions at Greifswald in 1810; but he resigned the following year, in order to become an active co-operator with the minister Stein in stirring up the national feeling of Germany. His songs, poems, and fugitive writings, full of

energy and fire, contributed not a little to rouse and sustain the spirit of Germany before and during the war of liberation. His famous song, *Was ist des Deutschen Vaterland?* and many others, are sung wherever German is spoken. In 1817 he married a sister of Schleiermacher's, and in 1818 became professor of History in the new university of Bonn; but, aiming steadily at constitutional reforms, he was suspended in 1819 for participation in so-called 'demagogic movements,' and was not restored till 1840. He was elected a member of the German national assembly in 1848, but retired from it in 1849. He returned to Bonn, and continued in his fugitive writings to advocate the views of the German national party. Vigorous in mind and body, beloved and revered by the whole German people as 'Father Arndt,' he died at the age of ninety, 29th January 1860. His works comprise an account of the Shetland and Orkney Islands (1826); numerous political addresses to the German nation; some volumes of reminiscences; and his poems (2d ed. 1865). See German lives of him by Langenberg, Baur, and Schenkel, and an English one, with preface by Seeley (1879).

Arndt, JOHANN, a German Lutheran divine, was born at Ballenstedt, Anhalt, in 1555, and died at Celle, Hanover, in 1621. His *Wahres Christenthum* ('True Christianity') was translated into most European languages, and is yet popular in Germany. Its object is edification—the promotion of practical religion; and it is written with great warmth and unction, and in a strain of piety bordering on mysticism. It has been called the Protestant *Imitatio*, and its author the Fénelon of the Protestant Church. There are two English translations—by Boehm (1720) and by Jaques (1815).

Arne, THOMAS AUGUSTINE, Doctor in Music, one of the best and most pleasing of English composers, was born in London, 12th March 1710, and received his early education at Eton. His father, who was an upholsterer, intended to educate him for the bar; but the love of music was too strong to be restrained. Young Arne became skilful as a violin-player, forming his style chiefly on the model of Corelli; and his zeal in the study of music induced his sister (afterwards the actress Mrs Cibber, 1714-66) to cultivate her excellent voice. He wrote for her a part in his first opera, *Rosamond*, which was first performed with great success in 1733. Next followed his comic operetta, *Tom Thumb, or the Opera of Operas*; and afterwards his *Comus* (1738), which displayed greater cultivation of style. He married a singer, Cecilia Young (1736); and after a successful visit to Ireland, was engaged as composer to Drury Lane Theatre, and wrote many vocal pieces for the Vauxhall concerts. The national air, *Rule Britannia*, which was originally given in a popular performance, *The Masque of Alfred*, was of his composition, as was also the well-known setting of *Where the Bee Sucks*, written for a performance of the *Tempest*. Besides music for many long-forgotten works, he composed two oratorios, the opera *Eliza*, and another, *Artaxerxes*, in the Italian style; but his genius was better adapted to simple pastoral melody than to great dramatic compositions. In later life he enjoyed considerable reputation as a music teacher, his most distinguished pupil being Miss Brent. He died in London, 5th March 1778. See CIBBER.

Arnee, the wild Buffalo (q.v.) of India.

Arnhem (anc. *Arenacum*; Ger. *Arnhem*), the capital of the Dutch province of Guelderland, on the right bank of the Rhine, 38 miles ESE. of Utrecht by rail. It manufactures tobacco, woollen and cotton goods, soap, beet-sugar, and

paper. The environs are exceedingly picturesque, forming a favourite residence of merchants of the Low Countries. Among its most remarkable buildings are the 'great church,' with interesting monuments, and the town-hall, whose grotesque carvings have gained for it the name of 'Devil's house.' Sir Philip Sidney died in 1586 at Arnhem; in 1813 the town was taken by the Prussians. Pop. 71,000.

Arnhem Land, the peninsular northern projection of the Northern Territory of the Commonwealth of Australia, so called from the ship of the Dutch navigators who discovered land here in 1618.

Arnica, a genus of Tubulifloral Composites. The rhizome, leaves, and flowers of the Mountain Arnica (*A. montana*), sometimes called Mountain Tobacco, formerly enjoyed much repute in medicine as a stimulant in paralytic affections, low fevers, &c. The flowers are still employed to yield a tincture which is of service as an external application to wounds and bruises. The plant yields a considerable quantity of tannin, resin, volatile oil, and a peculiar alkaloid (arnicin). The rhizome is perennial and crooked, the stem about two feet high, simple or little branched, with few leaves, bearing on the summit a head of flowers of a dark golden yellow, often two inches in breadth. It flowers from June to August, forms an ornament of mountain meadows in Germany and Switzerland, and is found upon the Continent as far south as Portugal, and as far north as Lapland. There are a few North American species.

Arnica.

Arnim, HARRY, GRAF VON (1824-81), representative of an ancient noble house in the Mark Brandenburg, in 1864-70 was Prussian ambassador at Rome, and supported the German bishops at the Vatican Council; but as German ambassador to France (1872-74) he fell into Prince Bismarck's disfavour, and on a charge of purloining state documents was sentenced to a year's imprisonment. He had already retired into exile, and died at Nice. His only son Henning (1856-1910) married Miss Beauchamp, born in Sydney, who became famous as authoress of *Elizabeth and her German Garden* (1898), *Elizabeth's Adventures in Rugen*, *Fraulein Schmidt* and *Mr Anstruther*, *The Caravaners* (1909), and other characteristic works. She married Earl Russell in 1916.

Arnim, LUDWIG ACHIM VON, born at Berlin in 1781, began his career as an imaginative author with *Hollins Liebleben* (1802), with Clemens Brentano stirred up sympathy for interest in the old popular poetry, and by the publication of *Des Knaben Wunderhorn* (1808-19). In 1809 appeared *Der Wintergarten*, a collection of novels; in 1810, a romance, *Die Gräfin Dolores*; in 1811, *Halle und Jerusalem*, a humorous dramatic poem; and in 1817, *Die Kronenwächter*, an historical novel. He died in 1831.—His wife, BETTINA VON ARNIM, a sister of Clemens Brentano, was born in 1785 at Frankfurt, and married him in 1811. The great event of her early life was her enthusiastic attach-

ment to Goethe, whom she first saw in 1807, he being then nearly sixty. The correspondence, published under the title of *Goethes Briefwechsel mit einem Kind*, in 1835, and translated by Bettina into English, is mainly founded on fancy. Her later works were semi-political in character. She died at Berlin, 20th January 1859. See Loper, *Goethes Briefe an Bettina* (1879).

Arno, next to the Tiber the most considerable river of Central Italy, rises on Mount Falterona, an offset of the Apennines, at an elevation of 4444 feet above sea-level, and 25 miles N. of Arezzo. It flows 140 miles in a generally westward direction, till it falls into the sea, 11 miles below Pisa, where it once had its embouchure. At Florence it is 400 feet wide, but is fordable in summer; and so far, except in the summer, it is navigable for barges. The Italian poets speak of 'the golden Arno'; but, in truth, its waters have mostly the colour of *café-au-lait*. The Arno is noted for the rapid and destructive character of its inundations, the most memorable being those of 1537 and 1740.

Arnobius (1) the Elder, a teacher of rhetoric at Sicca, in Numidia, about 320 A.D. He became a Christian about 300, and died most probably in 327. He wrote, according to Hieronymus, to prove the sincerity of his faith to the bishop who was to baptise him, his seven books, *Adversus gentes*, in which he meets the objections brought against Christianity, but shows that his own theology was not free from Platonic-gnostic conceptions. His work has great value to the student of the religion of Rome from the materials it contains. The standard edition is that by Reifferscheid (1875). An English translation will be found in vol. xix. of the *Ante-Nicene Library*.—(2) **ARNOBIUS** the Younger was a bishop in Gaul in the second half of the 5th century. He wrote a commentary on the Psalms, which is still extant, and which shows traces of semi-Pelagian heresy. It is reprinted in the 53d vol. of Migne's *Patrologia Latina*.

Arnold OF BRESCIA, was a native of that town, and was distinguished by the success with which he contended against the corruptions of the clergy in the early part of the 12th century. He was educated in France under Abelard, and adopted the monastic life. By his preaching, the people of Brescia were exasperated against their bishop, and through him Arnold was cited before the second Lateran Council, and banished from Italy (1139). He retired to France, but experienced the bitter hostility of St Bernard, Abelard's opponent, who denounced him as an enemy of the church. He thereupon took refuge in Zurich, where he remained five years. Meanwhile, an insurrection against the papal government had taken place in Rome, and thither in 1143 Arnold repaired, and endeavoured to lead and direct the movement. He exhorted the people to organise a government similar to the ancient Roman republic, with consuls, tribunes, and equestrian order; but they were disunited and restless, and gave way to the grossest excesses. The city, indeed, continued for ten years in a state of agitation and disorder; but these violent struggles were subdued by Pope Adrian IV. (Nicholas Breakspear), who, feeling the weakness of his temporal authority, turned to the spiritual, and resorted to the extreme measure of laying the city under an interdict, when Arnold, whose party became discouraged and fell to pieces, took refuge with certain influential friends in Campania. On the arrival of the Emperor Frederick Barbarossa for his coronation, in 1155, Arnold was arrested, brought to Rome, and hanged, his body burned, and the ashes thrown into the Tiber. But his influence lived after him, and through his sympathetic insight into his country's needs, his

name is even yet revered and loved in Italy, though he left no record of his doctrines save in the heart of the people. His eloquence and disinterestedness are acknowledged even by his enemies, who are also his biographers, and who have yet placed him in history alongside Rienzi and Savonarola. His life is the subject of tragedies by Bodmer and by Nicolin.

Arnold of Winkelried. See SEMPACH.

Arnold, BENEDICT, a talented American military officer, whose early brilliant exploits are obscured by his attempt to betray his native country, was sprung from Rhode Island stock, and born in Norwich, Connecticut, 14th January 1741. By nature reckless and fond of adventure, he ran away from home when fifteen years of age, and joined the provincial troops then engaged in the old French war, but soon deserted. At twenty-one he became a merchant in New Haven. On the breaking out of the Revolutionary war, he joined the colonial forces; accompanied an expedition of 'Green Mountain Boys' (Vermonters), which, under Ethan Allen, captured Fort Ticonderoga; and in 1775, led an isolated detachment of an invading army through the wilds of Maine to Quebec, in the unsuccessful siege of which city he bore an important part. Here he was severely wounded, and for gallant conduct was made a brigadier-general by the colonial congress. Retreating from Canada by way of Lake Champlain, he superintended the construction on its waters of a flotilla, which he handled with much skill at the battle of Valcour Island.

Arnold was of an imperious and violent temper, and was frequently in difficulties with his fellow-officers; and, though greatly admired by General Washington and others high in rank, he appears to have had bitter and influential enemies. In 1777 five of his inferiors in rank were promoted by congress over his head to be major-generals—a circumstance which may be presumed to have sown the seeds of his subsequent disaffection towards the colonial cause. Though greatly chagrined, he was induced by Washington to retain his connection with the army; and, when on leave of absence he heard of the invasion of Connecticut by Governor Tryon, he hastened to join the colonial forces, and was present at the battle of Ridgefield, where his horse was killed under him. For gallantry in this action, he was made a major-general.

In the same year Arnold was sent by Washington to aid in the military operations in eastern New York, and fought with his customary impetuosity in the battles of Saratoga (having his horse killed, and being himself severely wounded), and is credited with having contributed largely by his skill and bravery to the capture of the invading army under General Burgoyne. Disabled temporarily by his wound, he spent much of the winter of 1777-78 in the hospital at Albany, and on the retirement of the royal forces from Philadelphia in the following spring, he was placed in command of that city. Here he met and married the accomplished daughter of Mr Edward Shippen, at whose house the unfortunate Major André (q.v.) had been a welcome guest during Howe's occupation of the city; and through this marriage appears to have begun that fatal acquaintance which resulted in the death of André as a spy, and the disgraceful downfall of Arnold as a traitor.

In 1780 Arnold sought and obtained the command of West Point, on the Hudson River (one of the most important posts in the colonies), which, through a conspiracy with André, he agreed to betray into the hands of the British commander. On the capture of André, and the discovery of the plot, Arnold precipitately fled to the British lines, and was given a command in the royal army. In

1781 he led an expedition against his native state. Four of his sons served with distinction in the British army. After the war Arnold lived in England, and died disappointed and obscure in London, 14th June 1801.

There are Lives by Jared Sparks (1838), I. N. Arnold (1880), and C. B. Todd (1903); and see Trevelyan's *George III. and Charles Fox* (vol. 1, 1912).

Arnold, SIR EDWIN (1832-1904), the son of a Sussex magistrate, was a scholar of University College, Oxford, and won the Newdigate (1852) with a poem on *Belshazzar's Feast*, for a while was second master at Birmingham, and afterwards became principal of the Deccan College at Poona. Returning to England in 1861, he joined the staff of the *Daily Telegraph*, of which he became editor. He published a volume of poems in 1853, and as early as 1875, in the *Song of Songs of India*, was busy with his life-task of interpreting in English verse the life and thought of the East. His most important book is *The Light of Asia, or the Great Renunciation* (1879), a verse-rendering of the story of the life of Buddha. His statement of Indian philosophy has not been accepted by experts as impeccable, and his fluent and sometimes grandiose blank verse was by critics generally regarded as lacking in distinction; but the work attained great popularity. In *The Light of the World* (1891) he attempted, more audaciously and less successfully, to do for Jesus Christ's life and teaching what he had done for Buddha. Other works were *Pearls of the Faith; With Sa'adi in the Garden* (translations from the *Gulistan*); *The Tenth Muse, and other Poems; Potiphar's Wife; Adzuma, or the Japanese Wife* (a play); *The Voyage of Ithobal*. He was C.S.I. (1877) and K.C.I.E. (1888).

Arnold, MATTHEW, was born on December 24, 1822, at Laleham near Staines, where his father, Thomas Arnold, afterwards head-master of Rugby, then lived and took private pupils. He was sent to Winchester in 1836, but was in 1837 transferred to Rugby, where he won the school prize for English verse in 1840, the subject being 'Alaric at Rome.' In 1840 he went to Balliol College, Oxford, where he won the Newdigate prize in 1843 for a poem on Cromwell. In 1844 he took his degree, with only a second-class in Greats; but in spite of this comparative failure in the schools, in 1845 he was elected a fellow of Oriel College, a distinction only conferred on men of the highest promise. In 1847 he became private secretary to the Marquis of Lansdowne, a Whig statesman of great sagacity and influence, who was unofficially consulted by the queen on most matters of political importance. He had been for a short time a master at Rugby, when in 1851 Lord Lansdowne appointed him an inspector of schools, and in the same year he married a daughter of Mr Justice Wightman. He had in 1849 published a volume entitled *The Strayed Reveller and other Poems*, under the initial 'A.' Five hundred copies were printed, but the reception of the book was so discouraging that the remainder of the edition was withdrawn from publication. In 1852 appeared a second volume, *Empedocles on Etna*, also under the initial 'A.', which was similarly withdrawn. In 1853 a volume of *Poems* appeared under his name, containing some of the suppressed poems, and also including 'Sohrab and Rustum,' a fragment of a romantic epic, the subject being an episode taken from Firdusi's *Shah-Nameh*. In 1855 a further volume of *Poems* (second series) appeared, including the epic poem of 'Balder Dead.' In 1857 Arnold was elected to the professorship of poetry at Oxford, and in 1858 published his tragedy of *Merope*, modelled on the traditions of the Greek drama. In 1867 he published his *New Poems*, which contained 'Thyrsis' and 'A Southern Night.' In

1869 two volumes of *Collected Poems* were published, 'Rugby Chapel' here appearing for the first time. Meanwhile he had been also publishing some of the selections of his professorship—*Studies in Homeric Translation* in 1861 and 1862, *On the Study of Celtic Literature* in 1867; some important educational treatises, such as *The Popular Education of France* in 1861, *A French Eton* in 1864; as well as the famous volume of *Essays in Criticism* in 1865, *Culture and Anarchy* in 1869, and *Friendship's Garland* in 1871. He then began to interest himself in the question of popular religion, publishing in 1870 *St Paul and Protestantism*, in 1873 *Literature and Dogma*, in 1875 *God and the Bible*. Beside these volumes he published selections from Wordsworth and Byron, with introductions, and wrote introductions for selections from Gray and Keats in Ward's *English Poets*. He retired from his inspectorship after over thirty years' service, was awarded a government pension for his services to literature in 1883, and a few months later visited America to give lectures, which were admittedly ineffective, owing to his inaudible delivery. Before his American tour he had published *Mixed Essays* in 1879 and *Irish Essays* in 1882. In 1883 appeared a second series of *Essays in Criticism*. He died suddenly on April 15 in the same year, at Liverpool, of heart disease, and was buried at Laleham. In 1895 there appeared a collection of his *Letters*, which have little literary distinction, but serve to illustrate the simple and domestic nature of his temperament. Most of these letters were, however, written to members of his own family, and it is possible that they do not represent adequately his epistolary quality.

Matthew Arnold's work falls into four distinct sections—(1) his poems; (2) his literary and critical essays; (3) his studies in popular religion; (4) his educational writings—a volume of selected passages from his reports appeared in 1911.

(1) The poems of Matthew Arnold have a perfectly distinct quality of their own. They are deeply penetrated with Greek ideas and Greek methods of expression. His larger enterprises, such as *Merope*, 'Balder Dead,' and *Empedocles on Etna*, are the least effective. On the other hand, 'Sohrab and Rustum' is a most majestic fragment of Homeric epic, loaded with noble similes. But he had a great power of producing stately and beautiful elegiac poems, in which the passion of the past, touched with mournful regret, frames itself in lovely English backgrounds of the tilled and pastoral country which he loved the best. In his lyrics there is to be found a note of strictly suppressed passion, which emphasises a temperate control rather than a natural expansion of emotion. And there are many lyrics as well of exquisite freedom and colour, besides sonnets of gnomic weight and measured bareness. Taken altogether, the poems are not the work of a hopeful or impulsive mind. They are stern, reflective, sorrowful, regarding the world as a place full of beauty which it is impossible to enjoy lightly, and as a scene of duty which it is unmanly to wish to avoid. Their most striking characteristics are refinement, economy of effect, stateliness, and nobility of a learned order. They are the work of a poet whose emotion is held serenely in check by a scholarly and philosophical instinct.

(2) It is perhaps as a literary critic that Matthew Arnold did the most marked service to his generation. He protested with all his might, trenchantly and ironically, against the besetting sin of the English mind in literature, which is a species of individualistic anarchy. The Englishman in literature has no respect for the expert; his heady theory of liberty makes him value private judgment above authority. Matthew Arnold's position was that a

critical tradition must at all costs be developed; that the critic's business was to acquaint himself with the best that has been thought and written, so as to discern the law of literary development, by virtue of which masterpieces establish and retain their hold upon the mind. This critical authority, if established, would prevent writers from weltering in lazy experiment, and would save the readers of literature both from base and mean preferences, as well as preserve them from being at the mercy of deft tricksters. His own taste in literature was more irresponsible than his creed, and his judgment both of established and contemporary writers was highly eclectic. He undervalued many great authors, and disliked them petulantly; he also expended much curious interpretation on little attractive figures of no great significance. But he did undoubtedly suggest to the literary circle of England the truth that expert tradition has an immense formative influence, and it may be plainly said that he did more to rehabilitate the office of the critic than any modern English writer.

(3) In his studies of popular religion Arnold had a great temporary effect in dispersing the mists of ecclesiastical dullness and pedantry, in making religious speculation respectable, and in doing something to break down antiquated popular theories of revelation and biblical authority. He induced a great many thoughtful people to look beneath a conventional orthodoxy, and to discern the progress of the religious spirit, through the emphatic Jewish ideal of righteousness, up to the infinitely more noble and tender principles of Christianity. He sent many men and women back to the Bible, not as a verbally inspired manual of faith, history, and morals, but as a great collection of inspiring rather than inspired writings, in which the dealings of God with man were passionately and fallibly presented. The books did not gain by the compassionate sort of condescension which characterised their expression. Their lambent irony, their almost painful kindness, irritated a certain sturdy type of orthodox believer. But it was a fine crusade against that human tendency to annex religion to conventional and respectable conservatism, and to convert the most protesting influence and the most regenerating force in the world into a tame and acquiescent optimism.

(4) Arnold's educational utterances are suggestive rather than profound. He was the first to enforce the need of organisation in secondary curricula, a problem which has still been left untackled, and with regard to which he made no practical proposals. But Matthew Arnold's whole theory of education was based upon literary culture, and takes no account of the expanding needs of scientific and technical training, still less of the psychological element which is tending to revolutionise the whole system of national education. His theory of education was that of a process, partly intellectual, partly emotional, in which the acquisition of information played a large part, and the root-idea of which was to subject the mind, under critical guidance, to the influence of the masterpieces of literature; it was this attitude which drew from a critic the well-known gibe about Matthew Arnold's belief in the marked preference of the Almighty for university men; and it is clear that his instinctively academical traditions blinded him to the wider tendencies which were making themselves felt in educational theory. It is almost startling to realise, from the volume of selections (1911) mentioned above, how ineffective and unfruitful his doctrines have proved to be, and the impracticability of reducing his ideal of culture to anything like a comprehensive system. Secondary education is even more chaotic at the present moment than it was in Matthew Arnold's day, because the curriculum has been flooded with new

subjects, while co-ordination seems as far off as ever.

Matthew Arnold as a man was one of the most gracious and princely personalities. He was tall and impressive, and his motions and gestures had a bland and insinuating courtliness. His great head with its dark, rippled hair, his big features, his large, expressive mouth, framed in heavy side-whiskers, his gentle glance, made him a marked figure at any gathering. His nature was simple and affectionate, as his letters abundantly show; but this simplicity was often overlooked in face of his elaborate manner, his courteous deference, his mellifluous and *soigné* utterance. The popular impression of his attitude was brilliantly indicated by Mr W. H. Mallock in the *New Republic*, under the thinly veiled disguise of 'Mr Luke.' But all who knew him loved, trusted, and respected him to an extent which nothing but genuine affection and perfect loyalty could have earned. In a generation of notable figures, he was one of the most attractive and impressive. He threw his whole weight on the side of reasonableness, urbanity, persuasiveness, and sympathy; and it is remarkable that a writer whose favourite attitude was a cultivated irony should have given so little personal offence, and on the whole have been so little misunderstood.

It is understood that Matthew Arnold expressed a definite wish that his biography should not be written, but there are three small monographs dealing with his life and work, by Professor Saintsbury in the 'Modern English Writers' series (1899), by Mr H. W. Paul in the 'English Men of Letters' series (1902), and by Mr G. W. E. Russell in the 'Literary Lives' series (1904). Further biographical details can be obtained from *The Letters of Matthew Arnold*, from 1848 to 1888, edited by Mr G. W. E. Russell (1895, reprinted 1901), and from *Matthew Arnold's Notebooks*, with a preface by the Hon. Mrs Wodehouse (Matthew Arnold's daughter, now Lady Sandhurst), 1902. *The Works of Matthew Arnold*, in 15 volumes (1904-5), includes his letters, and contains, in vol. iii., a complete bibliography. An article in the *Quarterly* in Jan. 1905, by Dr T. H. Warren, contains a survey of several of the above-mentioned books.

Arnold, SAMUEL (1740-1802), successively organist to the Chapel Royal (1783) and to Westminster Abbey (1793), produced operettas and oratorios, but is best remembered for his collection of cathedral music.

Arnold, THOMAS, head-master of Rugby, was born 13th June 1795, at East Cowes, in the Isle of Wight. In 1807 he went to Winchester, whence in 1811 he was elected a scholar of Corpus Christi College, Oxford. Having taken a first class in classics (1814), he was next year elected a fellow of Oriel, and he gained the chancellor's prizes for the Latin and English essays in 1815 and 1817. He took deacon's orders in 1818, and the year after settled at Laleham, near Staines, where he prepared pupils for the university. In 1820 he married Mary Penrose, daughter of a Nottinghamshire rector, and sister of one of his earliest friends; in August 1828 he entered on the task of regenerating Rugby, where he had the tact to make himself both loved and feared. His influence was felt in all the public schools of England, and he remains a noble type of a head-master. In 1832 he purchased for his vacations Fox How, between Rydal and Ambleside. A Whig and a Low Churchman, in 1841 he received from Lord Melbourne the Regius Professorship of Modern History at Oxford. He died suddenly of *angina pectoris*, 12th June 1842, and was buried in Rugby Chapel. His principal works are six volumes of Sermons (best ed. 1848); an edition of Thucydides (3 vols. 1830-35); the *History of Rome* (3 vols. 1833-43, broken off at the end of the second Punic war), in which he very closely followed Niebuhr in the theory that the early history was

largely fabulous and founded on the lays of minstrels; and his Oxford *Lectures on Modern History* (1842). 'These,' in the words of an *Edinburgh* reviewer, 'are all proofs of his ability and goodness. Yet the story of his life is worth them all.' And that story has been admirably told by Dean Stanley in his *Life of Arnold* (1845; often reissued, edited, and abridged, as in 1901 and 1910). See, too, works by Findlay (1897), Worboise (1897), and Fitch (1897).

Arnold, THOMAS KERCHEVER (1800-53), born at Stamford and educated at Cambridge, was rector of Lyndon in Rutlandshire, edited school classics and a Latin lexicon, and produced manuals of Greek and Latin prose composition.

Arnot, WILLIAM (1806-75), Scottish preacher and author of religious works, was born at Seone, and was the popular minister of a Free church, first in Glasgow and then in Edinburgh. See his *Autobiography and Memoir* (1877).

Arnot, NEIL (1788-1874), born at Arbroath, the son of a Catholic farmer, studied at Aberdeen and in London, where from 1811 till 1855 he carried on a medical practice. He wrote on physics, and invented the water-bed, a stove, and a ventilator.

Arnotto. See ANNATTO.

Arnsberg, a manufacturing town of Westphalia, on the Ruhr, 45 miles S.E. of Münster, was a main seat of the famous Velmgetichte (q.v.); pop. 10,000. Paper is the principal product.

Arnstadt, a town of Thuringia, on the Gera, 10 miles S. of Erfurt; pop. 20,000.

Arnsvalde, a Prussian town, 41 miles S.E. of Stettin, between three lakes, with manufactures of iron, machinery, matches, and woollens; pop. 10,000.

Aroideæ. See ARUM.

Ar'olsen, capital of the state of Waldeck, on the Aar; pop. 3000.

Aromatics constitute a class of medicines which owe their properties to the essential oils, to benzoic and cinnamic acids, to volatile products of distillation, or to odorous glandular secretions. The plants that contribute to this class of medicines are those which yield essences, camphor, or odorous resins, and amongst the families which yield the most important aromatics are the Labiatae, Umbelliferae, Lauraceae, Myrtaceae, Rutaceae, Coniferae, Zingiberaceae, Orchidaceae, &c. In some cases the aromatic matter is diffused throughout all parts of the plant, but it is usually condensed in particular organs, such as the root, in the case of ginger and galanga; or the bark, in the case of cinnamon, canella, and cascarilla; or the flowers, as in the case of cloves; or the fruit, as in the case of anise and vanilla; or the wood, as in the case of sandal-wood and aloes-wood; or the leaves, as in the case of most of the Labiatae, Umbelliferae, &c. They may be grouped thus: (1) those in which the active principle is an essential oil, as the oil of thyme, lavender, cajeput, neroli, fennel; (2) those containing camphor, or an allied body, such as artificial camphor obtained from turpentine; (3) bitter aromatics, in which there is a mixture of a bitter principle and an essential oil, as chamomile, tansy, wormwood; (4) those of which musk is the type, such as civet and ambergris, and certain plants with a musk-like odour; (5) those containing a fragrant resin, as benzoin, myrrh, olibanum, storax, and the balsams of Peru and Tolu, which possess stimulant properties; (6) those which are artificially produced by destructive distillation, as tar, creosote, benzol, or the various empyreumatic oils. They are mostly stimulants and antispasmodics; some act as vermifuges and tonics. See also PERFUMERY.

Aromatic Series. This term is applied to a large group of organic chemical compounds, many of which occur in balsams, essential oils, and other substances having an aromatic odour. It was originally limited to the compounds of the benzoic group, but it has now been extended so as to include other series homologous with them, and ranging round the group of hydrocarbons, C_nH_{n-6} . The simplest of these hydrocarbons is Benzene (q.v.), in which there are six atoms of carbon, the formula being C_6H_6 . Now, such a body is an unsaturated one (see ATOMIC THEORY), and is capable of uniting with monatomic elements such as chlorine to form chlorides, containing from one to six atoms of chlorine. To account for this, Kekulé has devised a structural formula for benzene, which assists one in understanding the complex relations of the aromatic series; but it must be borne in mind that such formulae do not profess to represent the actual positions of the atoms in the compound, but are only used as convenient stand-points from which to regard them. In Kekulé's

formula, the double lines, uniting the atoms of carbon, indicate that each of these atoms can still unite with an atom of hydrogen. From this peculiar construction, it is evident that the compounds of the aromatic series must have distinctive properties, and the number of these compounds be very large. Thus, referring to chlorine, we see that we may either replace hydrogen by chlorine, or add chlorine to benzene, the resulting bodies having the composition C_6Cl_6 and C_6H_5Cl , when the full amount of chlorine has been taken up. So also oxygen may enter into the compound, giving us a series of bodies called *phenols*, which are monatomic, diatomic, or tetratomic, according to the number of atoms introduced. The phenols correspond to the alcohols of the fatty series (see ALCOHOLS), ordinary phenol having the formula C_6H_5OH , that of common alcohol being $C_2H_5(OH)$. Hydrogen may also be replaced by amidogen, NH_2 , giving rise to *Amines* (see ALKALOIDS), the best known of which is Phenylamine, or Aniline (q.v.), $C_6H_5NH_2$. The *nitro compounds*, in which hydrogen is replaced by the group NO_2 , include nitrobenzene, or artificial oil of bitter almonds (not to be confounded with the true oil), the formula of which is $C_6H_5NO_2$. See NITRO-BENZENE.

When carbon enters the benzene group, C_6H_6 , it forms many new compounds. Thus hydrogen may be replaced by radicals such as methyl and ethyl, CH_3 and C_2H_5 , giving rise to such compounds as

Methyl benzene..... $C_6H_5CH_3$;
Ethyl benzene..... $C_6H_5C_2H_5$;

or, again, more than one molecule of these radicals may be introduced, as in

Dimethyl benzene..... $C_6H_4(CH_3)_2$;
Methyl-ethyl benzene $C_6H_4CH_3C_2H_5$.

From these again are derived aldehydes, alcohols, and acids, of which we can only give a single example:

Methyl benzene, or toluene... $C_6H_5CH_3$;
Benzyl alcohol..... $C_6H_5CH_2OH$;
Benzyl aldehyde..... C_6H_5CHO ;
Benzoic acid..... C_6H_5COOH .

All of which, in their composition and properties, show close analogies to the corresponding fatty compounds. An account of the aromatic series would be incomplete without reference to the *isomerism* which exists among its members. A reference to the formula for benzene will show that when only one atom of chlorine has been

introduced into the molecule, there can only be one monochlor benzene. When two, however, are present, or when one atom of chlorine and one of bromine have replaced hydrogen, as in chlorobromo benzene, the case is different:

Here we see that the atoms of hydrogen replaced may be either contiguous (1·2), separated by one group of CH (1·3), or by two groups (1·4); and that this is not a mere distinction on paper is borne out by experiment, which has succeeded in producing three chlorobromo benzenes, differing in properties, but identical in percentage composition. There are many other isomeric bodies known, but for further information the reader must refer to the article on ISOMERISM, or to a practical treatise on the subject.

Aromatic Vinegar differs from ordinary vinegar (which is acetic acid diluted with water) in containing certain essential oils which impart an agreeable fragrance. It is generally prepared by adding the oils of cloves, lavender, rosemary, bergamot, neroli, and cinnamon to the strongest acetic acid. Aromatic vinegar is a very pleasant and powerful perfume; it is very volatile, and when snuffed up by the nostrils, is a powerful excitant, and hence is serviceable in fainting, languor, headache, and nervous debility. Aromatic vinegar is generally placed on a sponge in a smelling-bottle or in a *rinaigrette*; it can also be purchased as a liquid in phials; and a drop or two allowed to evaporate into a sick-room, overpowers, but does not destroy any unpleasant odour. The liquid must, however, be cautiously dealt with, as it is very corrosive.

Aronia. See CRATÆGUS.

Aroostook, a river which, rising in the north of Maine, falls into the St John in New Brunswick, after a course of about 120 miles. It possesses an historical interest from its connection with the long-agitated question of the north-east boundary between British America and the United States.

Arouet, the family name of Voltaire (q.v.).

Arpad, the national hero of Hungary, under whom the Magyars first gained a footing in that country, about 884. Chosen duke on his father's death, he extended his conquests by incessant and mostly successful warfare with the Bulgarians, Wallachians, and Moravians, and made more than one successful incursion into Italy. He died in 907, leaving his power to his son. The Arpad dynasty ruled Hungary as dukes from 889 to 1000, and as kings from that year until it became extinct in the male line with Andreas III. in 1301. Arpad yet lives in the popular songs of the country, and not a little legend has gathered round his name.

Arpad, or ARPHAD, was the name of a city in Northern Syria, long dependent on Damascus, and usually associated in Scripture with Hama (q.v.). See ASSYRIA.

Arpeggio, a chord of which the notes are given, not simultaneously, but in rapid succession.

Arpent, an old French land-measure, corresponding to the English acre. It contained a hundred square perches, and varied with the varying value of the perch from about an acre and a quarter to about five-sixths of an acre; or, in modern French measure, from one-third to one-half of a hectare.

Arpino (anc. *Arpinum*), the birthplace of Cicero and Marius, stands perched on an eminence, midway between Rome and Naples, about 65 miles from each; pop. 5000

Ar'quà, an Italian village with about 1000 inhabitants, 12 miles SW. of Padua, in the heart of the Euganean Hills. Here Petrarch died July 18, 1374; his house may still be seen, and his monument of red marble in the churchyard.

Ar'quebus, or HARQUEBUS (from Dutch *haakbus*, lit. 'a gun with a hook'), was the first form of hand-gun which could fairly be compared with the modern musket. Those of earlier date were fired by applying a match by hand to the touch-hole; but about the time of the battle of Morat, in 1476, guns were used having a contrivance suggested by the trigger of the arbalest or cross-bow, by which the burning match could be applied with more quickness and certainty. Such a gun was the arquebus. The arquebus being fired from the chest, with the butt in a right line with the barrel, it was difficult to bring the eye down low enough to take good aim; but the Germans soon introduced an improvement by giving a hooked form to the butt, which elevated the barrel; and the arquebus then obtained the name of the *haquebut*. Soldiers armed with these two kinds of weapon were designated *arquebusiers* and *haquebutters*—the former were common in the English army in the time of Richard III., the latter in that of Henry VIII.

Arquebusier.

Arraca'cha (*Arracacha esculenta*), a plant of the natural order Umbelliferae, a native of the elevated tablelands in the northern parts of South America. It is much cultivated in its native country for its roots, which are used as an esculent. When boiled, they are firm and tender, with a flavour not so strong as that of a parsnip. The plant is very like hemlock, to which genus Humboldt indeed referred it, and has a similar heavy smell. The flowers are in compound umbels, and are of a dull purple colour. The arracacha was at one time very strongly recommended as a substitute for potatoes; it was introduced into Britain through the exertions of the Horticultural Society, and its cultivation perseveringly attempted; but it has been found unsuitable to the climate of Britain, and of other parts of Europe where it has been tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavourable to it. The climate of the south of Ireland resembles that of its native regions more than any other in the British Islands. It seems to require a very regular temperature and constant moisture. There are probably some parts of the British colonies in which the arracacha would be found a very valuable plant. In deep loose soils

Arracacha.

it yields a great produce. It is generally propagated, like skirret, by offshoots from the crown of the root. By rasping the root and washing, a starch, similar to arrowroot, is obtained.—There is another species of the same genus, *A. moschata*, the root of which is uneatable.

Arracan. See ARAKAN.

Arrack, or RACK, is an East Indian name (derived from the Arabic) for all sorts of distilled spirituous liquors, but chiefly to that procured from *toddy* or the fermented juice of the coco and other palms, as well as from rice and the kind of brown sugar called *jaggery*. The palms in other tropical countries furnish a fermented beverage similar to the toddy of India, and in a few instances also it is distilled, but arrack essentially belongs to India and the adjacent countries. The coconut palm (*Cocos nucifera*) is a chief source of toddy or palm-wine, which is obtained from trees ranging from twelve to sixteen years old, or in fact at the period when they begin to show the first indication of flowering. After the flowering shoot or spadix enveloped in its spathe is pretty well advanced, and the latter is about to open, the toddy-man climbs the tree and cuts off the tip of the flower-shoot; he next ties a ligature round the stalk at the base of the spadix, and with a small cudgel he beats the flower-shoot and bruises it. This he does daily for a fortnight, and if the tree is in good condition, a considerable quantity of a saccharine juice flows from the cut apex of the flower-shoot, and is caught in a pot fixed conveniently for the purpose, and emptied every day. It flows freely for fifteen or sixteen days, and less freely day by day for another month or more; a slice has to be removed from the top of the shoot very frequently. The juice rapidly ferments, and in four days is usually sour: previous to that it is a favourite drink known in some parts of India as *callu*, and to the Europeans as *toddy*. When turning sour, it is distilled and converted into arrack. It is largely manufactured in Goa, Batavia, Ceylon, and Siam. A similar spirit is made pretty largely from the magnificent fan-leaved palm, *Borassus flabelliformis*, and also from the so-called date-sugar palm, *Arenga saccharifera*. The name is also given to a spirit obtained from rice and sugar fermented with coconut sap. An imitation arrack may be prepared by dissolving benzoic acid in rum.

Arragon. See ARAGON.

Arrah, a town of Bengal, 368 miles NW. of Calcutta. Here in 1857 a dozen Englishmen, with 50 Sikhs, held out for eight days in a small bungalow against 3000 sepoys. A force despatched to their aid fell into an ambush, and lost 290 out of 415 men; but finally they were relieved by Major Eyre. Pop. 50,000.

Arraignment, in the practice of the criminal law in England, means calling a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. His innocence being presumed, it is the law, and is so laid down in the most ancient books, that, though charged upon an indictment of the gravest nature, he is entitled to stand at the bar in the form and in the garb of a free man, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands. When arraigned on the charge of treason or felony, the prisoner may be called upon by name to hold up his hand, by which he is held to confess his identity with the person charged. This form, however, is not an essential part of the proceedings at the trial, and it is sufficient for the prisoner, when arraigned, to confess his identity by verbal admission or otherwise. When thus

duly arraigned, the indictment is distinctly read over to the accused in the English tongue, and he then either confesses the fact—that is, admits his guilt—or he puts himself upon his trial by a plea of 'Not Guilty.' If, as occasionally used to happen, the prisoner stood mute—that is, persistently refrained from or refused a direct answer to the indictment—the court proceeded to inquire whether the silence was of malice on the part of the prisoner, or was produced by the visitation of God. In old days the contumacious prisoner became liable to the appalling procedure of the *Peine Forte et Dure* (q.v.). But by the statute of 1828 (7 and 8 Geo. IV. c. 28) it was enacted that where a prisoner shall stand mute of malice, it shall be lawful for the court to order the proper officers to enter a plea of 'Not guilty,' on which the trial shall proceed, as if the plea had been actually pleaded by the prisoner himself. Where, however, there is room for doubt as to the sanity of the prisoner standing mute, a jury consisting of any twelve persons who may happen to be present is forthwith charged to inquire whether he has intellect enough to plead and to understand the course of the proceedings. If they find the affirmative, the plea of 'Not guilty' is entered, and the trial goes on; but if the negative, the insane person is ordered by the court to be kept in strict custody during His Majesty's pleasure, according to a relevant statute passed in 1800.

In the Scots criminal law, the expression *Calling the Diet* corresponds to arraignment. The prisoner is called upon by name by the presiding judge to attend to the indictment against him, which is read aloud by the clerk, and the prisoner is then required to plead, as in England, either 'Guilty' or 'Not guilty.' If 'Not guilty,' the trial proceeds—the prisoner, either by himself or his counsel, having always the last word.

The term arraignment is derived from the Old French *araisnement*, from *araisnier*, Lat. *adrationare*. See CRIMINAL LAW, PLEA, VERDICT.

Arran, an island of Buteshire, in the Firth of Clyde, 5½ miles SW. of Bute, 10 W. of Ayrshire, and 3 E. of Kintyre, from which it is separated by Kilbrannan Sound. It is of an oval form, 19 miles long and 10½ broad, with an area of 166 sq. m., about a seventh part being cultivated. Pop. in holiday season, 8300. The general aspect of Arran is mountainous, and in the north the jagged peaks are singularly grand. All around the coast is the low platform of an ancient sea-margin, with lofty cliffs on the S. and SW., from which the country rises abruptly. The highest point is Goatfell (2866 feet), a very prominent feature of the island. From its sides slope the romantic glens of Rosa and Sannox, and at its base to the SE. opens Brodick Bay, at the head of which lay, until lately, Brodick village. The new village is at Invercloy, on the opposite side of the bay. To the south, round a bluff headland, is Lamash Bay, the chief harbour of Arran, and the best on the Firth of Clyde, sheltered by Holy Island, once the seat of a monastery. A picturesque mass of columnar basalt, 1030 feet high, succeeds. Farther south lies Whiting Bay, near which are two cascades 100 and 50 feet high respectively. Whiting Bay has of late outstripped its neighbours as a holiday-resort. At the SE. point of Arran is Kildonan Castle, opposite which is the small isle of Pladda. Large caverns occur in the cliffs of the S. and SW. coast. In one of these, the 'King's Cave,' north of the columnar promontory of Drumadoon, Bruce hid for some time. Shiskine Vale, opening into Drumadoon Bay at Blackwaterfoot, is the most fertile part. Loch Ranza, a bay in the north end, is a herring-fishing rendezvous. The island is a favourite summer-resort. Arran is in some respects unique, contain-

ing, as it does, a fuller record of several geological epochs than any other part of the British Isles of equal extent. The oldest rocks represented are schists, grits, and conglomerate, which are confined to the northern part of the island, where they form a belt that almost completely encircles the large circular area of granite of which Goatfell is the culminating point. A narrow strip of Silurian crosses north Glen Sannox in the N.E., immediately to the east of which appears a band of Old Red Sandstone that trends south along the margin of the granite to near Brodick Bay, and thereafter crosses the island to Machrie Bay. Strips of Carboniferous strata occur along the margin of the Old Red Sandstone on the south and east side of the island, but they are much broken and interrupted by faults. They are well seen, however, on the coast at Corrie, and between the Fallen Rocks and the Cock. The Trias occupies a wide area in the south of Arran, but is largely overlaid by igneous rocks of various kinds; it is well exposed, however, in certain valleys and along the sea-coast. That strata of still younger age formerly overspread the island is shown by the occurrence of large blocks and masses of Lias and Cretaceous in a great volcanic vent midway between Brodick Bay and Machrie Bay. The volcanic phenomena of Arran are specially interesting—no fewer than seven separate zones of volcanic rocks having been detected, ranging in age from Silurian to Tertiary times. It has now been definitely ascertained that the granite of Goatfell, &c., belongs to the latest period (Tertiary) of volcanic activity. Glacial phenomena are well developed everywhere. The chief crops are oats and potatoes. The island belonged almost wholly to the Dukes of Hamilton, but passed by marriage to the House of Montrose. Many antiquities occur, such as cairns, standing stones, and stone circles. Loch Ranza Castle, now in ruins, was once a residence of the Scots kings. From Brodick Bay, Bruce sailed to Carrick on his memorable expedition. Standard works are Landsborough's, Bryce's (for geology), and *The Book of Arran* (ed. Balfour and Mackenzie, 1910-14).

Arranging, a term in music which means the adapting of a piece of music so as to be performed on an instrument or instruments different from those for which it was originally composed. It corresponds with the work of translation in literature, and requires similar gifts. The pianoforte arrangements of Franz Liszt have excelled all others, although in some cases he may have overstepped the boundary of propriety. Many classical masters, especially Bach, Beethoven, and Mendelssohn, have arranged their own music.

Arras, the capital of the French department of Pas-de-Calais, on the navigable Scarpe, 120 miles N. of Paris. It consists of an old town on an eminence, and a new town in the plain. Among the principal edifices are the cathedral (1755-1833) and the old citadel. The beautiful Gothic hôtel-de-ville (1510) and its belfry were destroyed in the Great War (q.v.). There are manufactures of lace, hosiery, beet-sugar, and agricultural implements, and a brisk trade in corn and oil. It was long so famous for its tapestry that in England the name *arras* was given to tapestry hangings. Arras was the capital of the Celtic Atrebatas (whence the name), and subsequently of the province of Artois. As such it was long a part of Burgundy. It was ceded to France in 1482, but came to Austria in 1493; nor did it finally become French till 1640, when Louis XIII. took it after a long siege. Robespierre was a native. Pop. 25,000.

Arrest. To arrest an offender or a debtor is to seize his person, in order that he may be brought to trial, or compelled to obey the law. In English

criminal practice, arrest may take place in two ways: (1) *Without Warrant*.—According to Mr Justice Stephen, any person may arrest any one who commits a felony or gives a dangerous wound in his presence, any one whom he reasonably suspects of felony (if a felony has in fact been committed), or any one whom he finds committing certain offences specially provided for by statute. A peace-officer may also arrest any one who commits a breach of the peace in his presence, or any one whom he reasonably suspects of felony (whether a felony has been committed or not). His statutory powers of arrest are also wider than those of private persons; he may, for example, arrest any person whom he finds loitering at night, whom he has reason to suspect of having committed or being about to commit a crime; and (in the Metropolitan district) any person loitering at night who cannot give a satisfactory account of himself. (2) *With Warrant*.—A warrant is an order addressed by a judge or magistrate to a peace-officer, or to the officers within a certain district. If the person against whom it is issued is not within the jurisdiction of the authority issuing it, the warrant must be 'backed' by a magistrate of the place where such person is, or is supposed to be. Warrants issued in one part of the United Kingdom may be backed by a magistrate in another part. By an act of 1881, provision has been made for backing warrants throughout His Majesty's dominions. The act applies to treason, piracy, and every offence which, by the law of that part of the empire where it was committed, is punishable by twelve months' imprisonment with hard labour. For the arrest of offenders against foreign law, or of offenders against British law taking refuge in a foreign country, see EXTRADITION.

In executing a warrant, or in making a lawful arrest, an officer, or even a private person, may break open doors in pursuit of the person whom he is authorised to take. Obstruction of an officer making an arrest has always been treated as a serious offence; it seems that a person may still be charged with treason if he rescues a prisoner charged with treason. Modern legislation treats this offence as a misdemeanour, for which imprisonment with hard labour is the appropriate punishment. But to rescue a murderer or a prisoner is punishable by penal servitude. The same subject is treated in Scotch law under the head *Deforcement*, which Sir Archibald Alison, in his work on the Criminal Law of Scotland (vol. i. p. 491), says, 'consists in the resistance to the officers of justice in the execution of their duty.' It is essential to such deforcement that it should be such as to defeat the warrant or other process which authorises the arrest. Mere unsuccessful attempts with this view are charged under the name of 'resisting and obstructing the officers of the law in the execution of their duty.'

On the other hand, persons who are active in assisting the officers of the law may be compensated for their expense and trouble, as provided by an act of 1851, which amends and extends the provision contained in an act of 1827. A special allowance may be made to any person who has shown extraordinary courage, diligence, or exertion.

In English civil procedure, arrest takes place only in exceptional cases. All the superior courts have power to arrest or attach persons for contempt. By an order of the court or a judge (which is not made without notice to the party), a writ may be issued to the sheriff, commanding him to arrest a certain person, and have him before the court to answer his contempt. Defendants on civil process were formerly arrested by means of the writ of *ca sa* or *capias ad satisfaciendum*. But this writ is now rarely issued, unless in the cases expressly

excepted out of the Debtors Act, 1869. That act put an end to imprisonment for debt, except where non-payment of money due involved contempt of or disobedience to the order of a competent court, as, for example, where a trustee refuses to comply with the order of a court of equity. Orders of committal are now made for the most part by judges of county-courts, to compel payment of a debt by instalments, where the debtor is drawing weekly wages, or has other means of paying the instalments, but has no furniture or other goods on which execution can be levied.

Arrest may also be made to prevent a debtor from absconding, or from removing his property out of the jurisdiction. Ancient writs available for this purpose were those of *capias ad respondendum* and *ne exeat regno*; the modern practice is regulated by the Debtors Act, 1869, and the Bankruptcy Act, 1883, sect. 25. Arrest on mesne process (i.e. during the progress of a suit, and before judgment given) is now abolished, except as above explained.

The following are privileged from arrest on civil process: Ambassadors and diplomatic representatives of foreign courts; peers of the United Kingdom; Scottish and Irish peers; members of parliament; clergymen during divine service, or going to or returning from service; and all persons attending any court of justice, as parties, witnesses, solicitors, or counsel. Barristers are probably entitled to their privilege only when attending the superior courts; Archbold, in his *Practice of the Common Law*, refers to a case where a barrister was discharged who was arrested on circuit. Persons in attendance on the sovereign are privileged; writs of protection were formerly issued to persons in the royal service, but this prerogative is now seldom or never exercised. In regard to privilege of parliament, it may be observed that though members of both Houses are free from arrest on civil process, actions may be brought against them; and the 10 Geo. III. chap. 50 provides that such actions are not to be delayed on pretence of privilege. It is also provided by the Bankruptcy Act, 1883, that if a person having privilege of parliament becomes bankrupt, he may be dealt with as if he had no privilege. No person who is a bankrupt may sit in either House; and if a member of the House of Commons fails to satisfy his creditors within a year after he is adjudicated a bankrupt, his seat becomes vacant. Privilege does not exempt any person from arrest for contempt of court.

In the Scots law, the word arrest is not a technical term for process against the person. But see ARRESTMENT and ARRESTMENT FOR FOUNDING JURISDICTION; also ATTACHMENT.

Arrestment, in the Scots law, is the legal process or diligence, as it is called, by means of which a debtor is prohibited from making payment or delivery to his creditor until another debt or claim due to the person making use of the arrestment is secured or paid. Thus, if A owes £100 to B, but B, again, is indebted to C, arrestment may be used by C in the hands of A; the effect of which is to prevent A paying to B until C's claim has been satisfied. A, the party in whose hands the arrestment is laid, is called the arrestee; C, the user of the arrestment, is called the arrester; and B, the arrester's debtor, is called the common debtor. The arrestment, however, has not the effect of transferring the debt or subject arrested. For that purpose, a particular form of action, called an *action of furthcoming*, is necessary, decree in which operates as a complete transfer to the arrester. Arrestment in security is also used on the dependence of an action, so as to secure the debt which the pursuer expects to establish by decree. Arrestments are frequently recalled by

the court as oppressive. The court, on petition, may recall or restrict an arrestment, either on caution or without caution. The corresponding diligence against land is called Adjudication for Debt, or, if in security, Inhibition.

The corresponding English term is Attachment of Debts (q.v.).

ARRESTMENT FOR FOUNDING JURISDICTION is a procedure in Scots law, by which a foreigner, or other debtor abroad, who is not subject to the jurisdiction of the Scottish courts, but who has movable property in Scotland, may be made subject to the jurisdiction of the Court of Session. By the Sheriff Courts Act, 1907, arrestment may found jurisdiction in the Sheriff Court. In the ordinary case, what is attached is money due to the foreigner, and any sum, however small, and any movable, if of appreciable value, is sufficient. The procedure is therefore one liable to great abuse; it should not be extended beyond the convenience of trade, on which the custom was originally based in the Netherlands. In practice it has been extended to all actions of a pecuniary nature, but not to actions relative to *status*. The practice must be treated as an exception to the general rule that a pursuer should go to the court of his debtor's residence. The only equivalent in England is the custom of foreign attachment in the city of London. Heritable property in Scotland is a distinct ground of jurisdiction against foreigners, without special procedure.

ARRESTMENT OF WAGES, so far as required for the aliment of the artisan or servant, has always been prohibited by the common law of Scotland. Similarly, salaries annexed to offices and pensions granted by the Crown are regarded as alimentary debts, and are not arrestable. By statute in 1845, the arrestment of wages was prohibited absolutely in small-debt actions. The limit of what is required for aliment in the case of artisans and farm-servants and labourers was fixed by statute in 1870 at 20s. per week, the excess being arrestable. This rule, however, does not apply to claims for rates and taxes, or to decrees for aliment.

Arrhena'therum, a genus of Grasses (q.v.).

Arrhenius, SVANTE AUGUST, born 1859 near Uppsala, was educated at the university there, and in 1895 became professor at Stockholm. Much of his best work has been done in establishing the 'ionic' theory of electrolytic dissociation, which has largely influenced modern chemical doctrine and research; but he has published a text-book of electro-chemistry (trans. 1902) and of cosmic physics, and has written on the relations of chemistry to toxins, anti-toxins, and serum-therapy, and on cosmic evolution.

Arrian, FLAVIUS, a native of Nicomedia, in Bithynia, was born about 100, A.D. A disciple of Epictetus, the Stoic philosopher, he was admitted to the citizenship in Athens, and in 124 A.D. to that of Rome at the hands of the Emperor Hadrian. He was appointed prefect of Cappadocia in the year 136, and under Antoninus Pius, the successor of Hadrian, he was promoted to the consulship. But some four years afterwards, he appears to have retired from public life, and devoted himself to literature in his native place, where he died at an advanced age in the reign of Aurelius. As the pupil and friend of Epictetus, he edited the *Manual of Ethics (Enchiridion)* left by his master, and wrote the lectures of Epictetus (*Diatribe*) in eight books, of which only four have been preserved. The most important work by Arrian is the *Anabasis Alexandrou*, or history of the campaigns of Alexander the Great, which has come down to us almost entire. This book is our chief authority on the

subject of which it treats, and is a work of great value. Arrian had chosen Xenophon as his model of composition, and hence the Athenians called him the young Xenophon. In close connection with his former history, Arrian wrote his Indian History, giving an account of the people of India. Other writings by Arrian, his letter to Hadrian on a voyage round the coasts of the Euxine Sea, and another, a voyage round the coasts of the Red Sea, are valuable with regard to ancient geography.

Editions of the *Anabasis* are by Kruger (1848), Sintenis (1867), Abicht (1876), Chinnock (1893), and Roos (1907), a trans. by Chinnock (1884).

Arrondissement, an administrative district forming a subdivision of a French Département (q.v.).

Arrow. See ARCHERY.

Arrow-grass. The popular name of *Tirglochin*, a genus of Alismaceæ, of which two species occur in Britain.

Arrowhead (*Sagittaria*), a genus of petaloid monocotyledons of the order Alismaceæ, distinguished by unisexual flowers, having three herbaceous sepals and three coloured petals, with numerous stamens and carpels, the latter separate. They are aquatic plants, natives of very different climates, from the tropics to the cold regions of the world.—The Common Arrowhead (*S. sagittifolia*) is a beautiful aquatic, a native of England, with arrow-shaped leaves which rise above the surface of the

Arrowhead (*Sagittaria sagittifolia*).

water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The starchy corms have sometimes been used for food, but have an acrid unpleasant taste. *S. sinensis* has long been cultivated in China and Japan; and *S. obtusifolia* (N. America) is also used as food. Several species and many varieties of this genus are found in North American waters.

Arrow-headed Characters. See CUNEIFORM.

Arrow-heads. See ELF-BOLTS and FLINT IMPLEMENTS.

Arrowroot is a variety of starch extracted from the roots of certain plants growing in tropical countries. It is a fine starchy farina, much valued as a delicacy, and as an easily digestible food for grown children and invalids. It is obtained from the root-stocks (*rhizomes*) of different species of *Maranta*, belonging to the Marantaceæ (Scitamineæ). The species chiefly yielding it is *M. arundinacea*, a native of tropical America, cultivated in the West India Islands, and growing about 2 feet high, with ovate-lanceolate somewhat hairy leaves, clusters of small flowers on two-flowered stalks, and globular fruit about the size of currants. The rhizomes are often more than a foot long, of

the thickness of a finger, jointed, and almost white, covered with large papery scales. They are dug up when a year old, washed, carefully peeled, and reduced to a milky pulp. In Jamaica the roots are reduced by beating in deep wooden mortar; in Bermuda, by means of a wheel-rasp; but modern machinery has now been introduced. The pulp is

Arrowroot (*Maranta arundinacea*):

A, flowering branch, B, base of flower stem; C, branch of the rhizome. (From Bentley and Trimen's *Medicinal Plants*.)

then mixed with much water, cleared of fibres by means of a sieve of coarse cloth or hair, and the starch is allowed to settle to the bottom. The water dissolves, and so removes the greater part of the albumen and salts, the starch quickly settling down as an insoluble powder, which is then purified by successive washings. The arrowroot is finally dried in the sun or in drying-houses, from which dust and insects are excluded by means of gauze. The careful peeling of the roots is of great importance, as the skin contains a resinous matter which would impart a disagreeable flavour. Great precautions are taken against impurities; and the knives used in peeling the roots, and the shovels used in lifting the arrowroot, are made of German silver. The West Indian arrowroot most esteemed in the market is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East Indian arrowroot is not in general so highly valued, perhaps because substitutes for the genuine arrowroot more frequently receive that name. The *Maranta arundinacea* is now, however, cultivated to some extent both in the East Indies and in Africa. *M. indica* is to be regarded as a mere variety, with perfectly smooth leaves. It is cultivated both in the East Indies and in Jamaica, and other species and varieties are sometimes cultivated. What is called Florida arrowroot is in part prepared from *Zamia integrifolia*; but the genuine *Maranta* arrowroot is also produced in Florida.

The amount of starch present in the rhizomes varies, according to age, from 8 to 26 per cent.

Arrowroot is exported in tin cases, barrels, or boxes, carefully closed up. It is a light, opaque, white powder, which, when rubbed between the fingers, produces a slight crackling noise, like that heard when newly fallen snow is being made into a snowball. Through the microscope the particles are seen to be convex, more or less elliptical, sometimes obscurely triangular, and not very different in size. The dry starch is quite inodorous, but when dissolved in boiling water, it has a slight peculiar smell, and swells up into a very perfect

jelly. Potato-starch, with which it is often adulterated, may be distinguished by the greater size of its particles, their coarser and more distinct rings, and their more glistening appearance. Refined sago-flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculated. Arrowroot is also sometimes adulterated with rice-starch, and with the common starch of wheat-flour.

Tapioca (see MANIOC) was formerly sometimes called Brazilian arrowroot; and the starch prepared from many other plants has often also usurped the name. Thus 'Chinese arrowroot' is said to be from the tubers of *Nelumbium speciosum*. East Indian arrowroot is often prepared from different species of *Curcuma* (see TURMERIC), while *Dionedyle*, *Zamia*, and other cycads are used in Mexico, *Thera oceanica* in the Sandwich Islands, and so on; even the starch of maize sometimes appearing as Oswego arrowroot, that of *Arum* as Portland arrowroot, and that of potato as 'English arrowroot'. Although materially differing in rate of digestibility, arrowroot proper having in this respect the advantage, all these varieties of starchy food have much the same nutritive value, and all alike require the addition of milk to form an adequate food. It should further be borne in mind that all starches alike are indigestible to infants, whose salivary ferment is undeveloped.

The name has been (probably wrongly) supposed to arise from use of the fresh roots to counteract the effects of poisoned arrows; and the expressed juice has been accordingly recommended as an antidote to poisons, and a cure for the stings and bites of venomous insects and reptiles.

Arrowsmith, AARON, born at Winston, Durham, in 1750, at the age of twenty came up to London, and by 1790 had established a great map-making business, his chief productions being maps of the World, North America, Scotland, and Southern India. He died 23d April 1823.—His nephew, JOHN (1790–1873), was also an eminent cartographer.

Arroyo Molinos, a village in Estremadura, Spain, noted as the scene of the complete discomfiture of the French forces under General Girard by Lord Hill on the 28th October 1811, who took 1500 prisoners, the whole artillery, colours, baggage, &c., with a trifling loss to himself. French historians (Thiers and others) maintain that the battle was 'undecided.'

Arru Islands, a group of over eighty islands in the Dutch East Indies, lying west of New Guinea, with a united area of about 2650 sq. m., and a population of some 25,000. The largest island is Tanna-Besar (77 miles long by 50 broad). The surface is low, and the coasts are steep and inaccessible, on the east side fringed with coral reefs. The soil is covered with the most luxuriant vegetation. The islands are remarkably rich in animal life, especially birds, mostly related to those of New Guinea. The inhabitants resemble the Melanesians of New Guinea more than the natives of the Moluccas. On the ground of this inclination to the Papuan type, in connection with the peculiar formation of the Archipelago. Russel Wallace advanced the theory that the Arru Islands formed originally a part of New Guinea. There is an active trade, but not in native hands. Cotton and woollen goods, iron and copper wares, Chinese pottery, knives, rum, rice, opium, and arrack are imported, and bartered for mother-of-pearl, trepang, edible nests, pearls, tortoise-shell, and the skins of birds of paradise.

Arsacidae, a dynasty of Parthian kings, so called from the name of its founder, Arsaces, who wrested a kingdom for himself from the feeble

grasp of the Seleucid Antiochus II. about 250 B.C. Its greatest kings were Mithridates, Phraates, Mithridates 'the great,' Volagases I., and Artabanus, who lost his crown and his life at Hormizdjan, in 227 A.D., in his attempt to stem the conquering career of Ardashir, first of the Sassanian kings of Persia (q.v.); see ARMENIA, PARTHIA.

Arsamas, a Russian town, 60 miles S. of Nijni-Novgorod. It has thirty-four churches, three monasteries, important leather manufactures, and considerable trade in sail-cloth and sheep-skins. Pop. 12,000.

Arsenal (through Ital. and Span. forms from Arab. *dār aḥḥiḥ*, 'workshop,' made up of *dār*, 'house,' *al*, 'the,' *aḥḥiḥ*, 'art.' The Span. *atarazana* best preserves the wider sense of the Arabic original; the other languages have narrowed its meaning to 'dock' or 'armoury'), a term formerly applied merely to a repository of naval stores and ordnance, but now extended to the foundries and factories of warlike stores, for both army and navy, as well as to the depôts where they are stored. The principal arsenals of Great Britain, in their true sense as naval stores and dockyards, are at Deptford, Chatham, Pembroke, Sheerness, Portsmouth, Plymouth, Rosyth. The only government foundry for shell and heavy guns in Great Britain is at Woolwich (q.v.); but there are several privately owned arsenals. There is a manufactory of small-arms at Enfield, and abroad arsenals at Gibraltar, Malta, and Calcutta, with a gun-factory at Cossipore. During the Great War vast temporary arsenals were constructed to manufacture munitions, most notable being Gretna. See DOCKYARDS.

Arsenic (through Lat. from Gr. *arsenikon*) is the name popularly given to a well-known poison, arsenious oxide, but, strictly speaking, the term is restricted to the metal, of which the symbol is As, and the atomic weight 75. The metal arsenic is found free in nature, but in a state of combination it occurs more frequently. The most important of all arsenical minerals, because of their use as ores of arsenic, for the preparation of white arsenic, or arsenious oxide, are those in which arsenic is combined with nickel and cobalt. The chief of these are arsenical pyrites, or leucopyrite, nickeline, cobaltine, and smaltine, which are found in Cornwall and the continent of Europe, as well as in other parts of the world. The last-named two are used for the preparation of blue colours for porcelain or stoneware. The presence of arsenic in a mineral may commonly be detected by the garlic odour which it emits before the blowpipe.

The metal is generally prepared from native arsenic, or arsenical pyrites. The latter is heated in long earthenware retorts with condensing chambers attached. The arsenic volatilises over into the receivers, where it condenses as a crystalline solid, leaving sulphide of iron. It is purified by redistillation. At present the supplies come from Germany, Spain, England, and America. Metallic arsenic is very brittle, can easily be reduced to powder by hammering, or even pounding in a mortar; and when a freshly cut surface is examined, it presents a brilliant dark steel-gray lustre, which, however, readily tarnishes on exposure to the air. The metal, as such, is not considered poisonous, but when introduced into the animal system it is there faintly acted upon by the juices and in part dissolved, at the same time exhibiting poisonous properties. When heated in the open air it burns with a peculiar bluish flame, and emits a characteristic garlic odour. The only use to which the metal arsenic is applied in the arts is in the manufacture of leaden shot of the various sizes, when its presence in small quantity in the lead renders the latter much more brittle

than it ordinarily is. Of all the compounds of arsenic the most important is the one already alluded to—namely, arsenious oxide. With sulphur, arsenic forms two important compounds: *Realgar*, As_2S_2 , a red, transparent, and brittle substance, which is employed in the manufacture of the signal-light called *White Indian Fire*; and *Orpiment*, As_2S_3 , or *King's Yellow*, a cheap pigment of a yellow colour. With hydrogen, arsenic forms arsenuretted hydrogen (arsine), AsH_3 , a very poisonous gas, and one which has been fatal to several chemists.

ARSENIUS OXIDE is the arsenical compound most familiarly known. It is obtained principally during the roasting of the arsenical nickel ores in Germany in furnaces communicating with flues. When the arsenic of the ore burns, it passes into the condition of arsenious oxide, As_2O_3 , and rising as vapour into the somewhat cool flue, is there deposited as a grayish powder, known by the names of *Smelting-house Smoke*, *Flowers of Arsenic*, *Poison-flour*, or *Arsenuretted Soot*. In this condition the arsenious oxide is contaminated with some impurities, from which it may be separated by introducing the gray powder into an egg-shaped vessel, and applying heat at the lower end, when the arsenious oxide rises in vapour, and condenses in the cool end as a transparent glassy or vitreous substance. Ordinary arsenious oxide of the shops (which is what is popularly known as *arsenic*) is a white crystalline powder, which feels decidedly gritty, like fine sand, when placed between the teeth, and has no well-marked taste. It is very heavy, so much so as at once to be noticeable when a paper or bottle containing it is lifted by the hand. It is soluble in about 10 parts of boiling water, or 100 parts of cold water. As ordinarily sold in quantities under 10 lb. in weight, the arsenious oxide is required by law to be coloured with $\frac{1}{10}$ of its weight of indigo, or $\frac{1}{8}$ of its weight of soot, the object of the admixture being to render any liquid to which the arsenious oxide might be added, with a murderous intent, of a black or bluish-black hue, and thus indicate the presence of something unusual. In packages of 10 lb. and upwards, arsenious oxide is allowed to be sold in the pure white crystalline form without coloration. When placed in a spoon, or other vessel, and heated, the arsenious oxide volatilises, and condenses in crystals on any cool vessel held above. Again, when arsenious oxide is placed on a red-hot cinder, the strong garlic odour characteristic of arsenic is given off. When thrown upon water, notwithstanding its great density (specific gravity 3.70) it partially floats on the surface, as wheat-flour does; and that portion which sinks in the water rolls itself into little round pellets, which are wetted only on the outside, and contain much dry arsenious oxide within. With water, arsenious acid is formed, which is soluble in water. Arsenious oxide is the anhydride of the acid. The solution of arsenious acid in water is recognised by three tests:

(1) Hydrosulphuric acid and hydrochloric acid produce a *yellow precipitate* of sulphide of arsenic, As_2S_3 , soluble in ammonia.

(2) Ammonio-sulphate of copper, an *apple-green precipitate* of arsenite of copper, CuHAsO_3 .

(3) Ammonio-nitrate of silver, a *yellow precipitate* of arsenite of silver, Ag_3AsO_3 .

In many cases arsenious oxide is used as a means of destroying animal life, but, happily, the processes for the detection of the poison in organic mixtures and in the animal tissues are unerring and trustworthy.

For the isolation and recognition of arsenious oxide in organic mixtures, such as the contents of a stomach, the method generally pursued is called *Reinsch's process*, from the name of its discoverer.

The manner of its application is to treat the organic mixture with water sufficient to render it thin, then add hydrochloric acid to the extent of one-eighth of the volume of the liquid, apply heat, and when the whole has been raised to near the boiling-point, introduce clean, newly burnished pieces of copper in the form of wire, gauze, or foil. If arsenious oxide be present in the mixture, a steel-gray coating of metallic arsenic will form on the surface of the copper. This apparent tarnishing of the copper may take place when no arsenious oxide is in the mixture, and may be produced by salts of mercury, antimony, &c., as well as by sulphur compounds, and even occasionally by fatty matters. To distinguish between the coating formed by arsenious oxide and that produced by other substances, the copper is taken out of the mixture, washed with water to remove acid, immersed in ether to dissolve off any adherent fatty matter, dried between folds of blotting-paper, introduced into the lower end of a dry glass test-tube, and there cautiously heated. The metallic arsenic, As , is driven off by the heat from the surface of the copper, rises in vapour into the upper portions of the test-tube, there meets the oxygen of the air, with which it combines, forming arsenious oxide, As_2O_3 , and deposits itself in the cool part of the tube in little glistening crystals. On cooling, the arsenic is obtained in a convenient form for applying tests. This method is not altogether free from possible error, for copper and hydrochloric acid sometimes contain traces of arsenic, for which they must be previously tested. For other medico-legal tests and modifications of the foregoing, see books on poisons, &c.

Arsenious oxide forms with bases salts called arsenites. Arsenious oxide, boiled with a solution of potash, or carbonate of potash, forms an arsenite of potash, used in medicine, and known as *Fowler's Solution* or *liquor arsenicalis*. Many sheep-dipping mixtures are composed of arsenious oxide, soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. A compound of arsenious oxide and the oxide of copper, called the arsenite of copper, or *Scheele's Green*, is a pigment used by painters as a pretty and cheap green paint. The same substance is, or was formerly, extensively employed in the manufacture of common green paper-hangings for the walls of rooms; and it seems certain that rooms covered with paper coated with this green arsenite of copper are detrimental to the health of human beings residing therein, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. Another green pigment is named *Schweinfurth Green*, and contains arsenious oxide, oxide of copper, and acetic acid, being a double arsenite and acetate of copper; it is also called *Paris Green*, and used as an insecticide, and for the destruction of parasitic fungi.

When taken into the stomach arsenic is soon absorbed into the blood, acting powerfully in such skin diseases as Psoriasis, Lepra, Eczema (q.v.), &c., and in Cancer. As a tonic alternative it holds a high place. The usual method of administering arsenic is in small doses (from three to five drops) of the liquor arsenicalis, largely diluted with water, twice or thrice in a day. When it is given, in the doses above mentioned, for eight or ten days, symptoms of poisoning begin to appear, the skin becoming hot, the pulse quick, the eyelids hot and itchy; the tongue has a silvery appearance; the throat is dry and sore, the gums swollen and tender; and if the treatment is persisted in,

salivation ensues, and then come nausea, vomiting, diarrhoea, nervous depression, and faintness. The quantity necessary to destroy life, of course, varies, but under circumstances favourable for its operation the fatal dose for an adult is from *two to three grains*. Death from a poisonous dose of arsenic may occur in a few hours, or after the lapse of days. Arsenic has been used frequently as a slow poison, the symptoms being attributed to inflammation of the bowels from natural causes. Fortunately, in most cases its detection is easy.

In some countries, especially in Austria, arsenic is given to cattle and horses to render the skin bright and glossy. In Styria arsenic is taken by the peasant girls to increase their personal attractions; and it has been definitely ascertained that over a considerable area, including Styria, Carinthia, Salzburg, Tyrol, Lower Austria, and the Erzgebirge, arsenic-eating is largely practised by men, who nevertheless attain a healthy old age. Arsenic-eaters, who generally begin the use of the drug secretly, say that it improves the complexion, increases the digestive powers, and so strengthens the respiratory organs as to enable the bearers of heavy burdens to climb mountains with ease. At first a dose may be taken once a week, afterwards daily; and there are authenticated cases of men who consume six grains—enough to poison three men—at one dose without inconvenience. Once the habit is established, it is impossible to give up arsenic-eating, terrible heart-gnawings following any attempt gradually to stop the practice; and sudden cessation causes death. Arsenic-poisoning in England, causing many deaths in 1900, was traced to the presence of the poison in beer, due to the employment of impure sulphuric acid in preparing the 'inverted' sugar used in brewing.

The *antidote* for arsenic-poisoning is a mixture of hydroxide of iron and oxide of magnesium. This is given in a moist state every few minutes until the urgent symptoms are relieved. If this is not to hand, one is recommended to evacuate the stomach, either with a vacuum-pump or else to cause vomiting by tickling the throat with a feather. Then demulcent drinks should be given, such as milk, white of egg and water, or flour and water. If the fatal symptoms be averted, let the patient for a long time subsist wholly on farinaceous food, milk, and demulcents.

Arsenopyrites, or **MISPICKEL**, a mineral consisting of arsenosulphide of iron (FeAsS), often worked (as in Cornwall) as an ore of arsenic. It is opaque, silver-white with grayish-black streak and metallic lustre; hardness, $5\frac{1}{2}$; sp. gr., 6. It crystallises in the orthorhombic system, the crystals being twinned.

Arsinoë, daughter of Ptolemy I., king of Egypt, born 316 B.C., married at sixteen the aged Lysimachus, king of Thrace, whose eldest son, Agathocles, had already wedded Lysandra, her half-sister. Desirous of securing the throne for her own children, Arsinoë prevailed on her husband to put Agathocles to death; whereupon Lysandra fled with her children to Seleucus in Asia, and induced him to declare war against her unnatural father-in-law. Lysimachus was slain, and Seleucus seized the kingdom. Arsinoë now sought refuge in Macedonia, which, however, was also taken possession of by Seleucus; but on his assassination, a few months later, by Ptolemy Cerannus, her half-brother, she received a hypocritical offer of marriage from the usurper, who wanted to destroy her two sons lest they should prove formidable rivals to his ambition. She consented to the union, and opened the gates of the town in which she had taken refuge, but her children were butchered before her eyes. She then fled to Egypt, where,

in 279, she married her own brother, Ptolemy II. Philadelphus.—There was a city of Arsinoë in Middle Egypt, formerly called Crocodilopolis; another near the head of what is now the Gulf of Suez; and three of the same name in Cyprus.

Arsinoëtherium, a remarkable Eocene mammal found by Andrews in 1902 in the Fayyûm in Egypt (along with ancient elephants, turtles, &c.)—a huge prehistoric rhinoceros with a pair of small horns behind the two enormous nasal horns. See Ray Lankester's *Extinct Animals* (1903).

Arson (Old Fr. from Lat. *ardere*, 'to burn'), in the criminal law of England, is a felony, described as the malicious and wilful burning of the house or building of another man. At common law, it was essential to the offence that the house or building burned should be that of *another*; but the common-law definition has been greatly widened by various statutes. Mere negligence will not support a charge of arson—there must be criminal intention. The matter is dealt with by the Criminal Law Consolidation Act of 1861, and various penalties of penal servitude and imprisonment are imposed. The statutory offence includes the setting fire to a house in the possession of the offender, if it be done with intent to defraud, and also the setting fire to growing woods or crops, or to a stack, a coal-mine, or a ship. To set fire to goods in a building is not arson unless the building catches fire, or unless the incendiary knew and disregarded the danger to the building. To cause explosions which are likely to endanger life or do serious injury to property is a felony. By special statutes for the protection of the public service, setting fire to ships of war, arsenals, government stores, &c., or the attempt to do so, is punishable by death.

In Scotland the technical term is *wilful fire-raising*. This is properly confined to setting fire to buildings, growing or stored corn, growing wood, or coal-heughs; but the common law extends to many minor offences, such as burning sheds, haystacks, and furniture. A man is of course entitled to burn his own property; but one of the most common offences is burning property with intent to defraud insurers. The tendency of the Scots law is to exact a wider criminal responsibility than in England for negligence in fire-raising, and for the indirect results of the offender's act. Until 1877 the statutory punishment of wilful fire-raising in Scotland was death, but penal servitude and imprisonment are now the sentences.

Ars-sur-Moselle (Ger. *Ars an der Mosel*), a town of Lorraine, on the river Moselle, 6 miles SW. of Metz by rail; pop. 5000.

Art. The category of art includes every object skilfully made or action skilfully performed by one or more persons for the purpose of giving pleasure to others by the emotion of beauty. The distinction between the arts and sports of action lies in this, that in the case of sport the action skilfully performed is done for the sake of giving pleasure to the doer. A work of art, therefore, implies, first, the birth in the mind of an individual, the artist, of an emotion or idea of beauty; secondly, the incorporation or execution of that idea in a work of art—that is to say, in material or visible form—either by his own hand or by the hands of others under his direction; and, thirdly, the existence of one or more persons then or thereafter capable of receiving from the work of art the emotion or idea of beauty which arose in the mind of the artist, and which he intended to convey. Thus every work of art stands as it were between two individuals, and depends upon both for its existence, the artist and the art-lover or person sensitive to beauty, but for this latter individual there is no name in the English language. We call him a connoisseur, or an art-

critic, or an art-amateur, but these designations are a mere makeshift for a missing word in our tongue. No work of art would ever be produced if the faculty of appreciating it did not exist in other persons. Moreover, the power which the public, or merely a small number of individuals, possess at a given date for appreciating a particular kind of art largely determines the kind of works of art produced by artists at that date. There is a continual action and reaction going on between artists and lovers of art which determines the character or style of art at any given date in any given place. As people vary from age to age, and likewise differ in different localities in the same age, the character of works of art varies likewise both in time and in geographical disposition. It follows that the only possible description of the art of the world is the history of art, which is the history of the mutations of the sense of beauty in mankind. We often hear people talk of the evolution of art as though far back at the beginnings of civilisation art had emerged in some rude form, and had thenceforward gradually, or more or less continuously, developed. Such, however, is by no means the case. Art does not evolve from age to age, but one school or kind of art succeeds another, and each may be supreme and unsurpassable in its kind. Particular schools of art evolve and decay, as, for instance, the school of Greek sculpture from, say, the 6th century B.C. to the 4th century A.D., between which limits it rose, flourished, and declined, its last stages being as feeble as its first. The history of art is a history not of an evolution, but of a succession. The earliest known works of art—paintings of the Stone Age on the walls of caverns—are as fine in their kind as the finest work of our own day is in its kind. We have not progressed at all in the fundamental quality which makes an object a work of art, nor will mankind ever progress in that respect.

From the definition with which we started it follows that the category of art and the category of morals are distinct. Art is not in itself either moral or immoral, good or bad. This is easily seen if we take a concrete instance. Any material may be employed by an artist to fashion into a work of art. Thus life itself may be so employed. A man who treats the raw material of his own life artistically, who learns to perform every action of life in an artistic manner, is called a 'gentleman.' A gentleman is an artist in living. It does not by any means follow that he is a good man. He may be a consummate blackguard. Conversely, a wholly good man may be no gentleman; and thus it is with any other category of art. A beautiful picture may be instinct with religious feeling or may be subservient to vice, art being alike independent of the one and the other. Only, a vicious kind of painting will be the work of vicious artists appealing to a vicious public, and therefore, for reasons entirely independent of art, such a school must of necessity be short-lived and, supported by a small coterie, doomed to rapid extinction. Art may be of a high or low type, and both alike good art. Thus cooking is an art, but even the best cooking is not art of a high type. No one would put the finest dish on a level with one of Beethoven's symphonies. Yet the one in its kind may be as good as the other in its kind, only the kinds are not equal. Again, a music-hall ditty that appeals to the groundlings is no less a work of art than the said symphony, only the creator that produced it and the public that appreciates it are of a lower order. The music-hall ditty, however, in its kind may be good, whilst a symphony in its kind may be bad; so that you may have a good work of art of a low sort and a bad work of art of a high sort, the words 'good' and 'bad' not being applicable to

kinds, but only to qualities of works of art. A work of art is good of its kind when it avails to convey the idea of beauty from the creator to the recipient. The idea of beauty, high or low, must first exist. Granted that it exists in however low a form, the test of a work of art is its power of conveying that idea from the creator to the recipient. All men are not alike capable of receiving every idea of beauty or sensitive to every form of expression. No man is universally so gifted. Thus no artist addresses, or can be appreciated by, all mankind. Some appeal to a larger number than others without necessarily being thereby actually greater artists than those who appeal to a smaller number of persons of a superior human quality. Thus popularity is no test of the quality of an artist. Popularity only proves that at least a germ of true art exists in the thing admired. Every one knows, for instance, that the most popular novels at a given date are seldom, if ever, the best, but no novel attains large popularity which contains no artistic element. There must exist some quality of beauty in every really popular work. The large public admires what it is capable of discerning, and is necessarily blind to what it has no capacity of seeing.

It follows that art history is the only complete definition of art. All that has been actually made or done in the past for the purpose of giving delight is art. What the future may produce in that kind no one can foretell, but it also will be art, however foreign it may be to existing taste. Works of art may be divided into two large groups: those which exist for their own sake, and those which consist of objects of utility to which a form or covering of beauty has been intentionally added. Thus a knife with a carved handle is a work of decorative art, the carving being intentionally added solely for the purpose of giving pleasure. Works of expressive or creative art did not develop out of works of decorative art, as far as we can tell, but sprang into existence independently. The earliest of either sort known to us come from the latter part of the early Stone Age, twenty thousand years ago or more. Certain caves in Spain and southern France have in recent years been found to contain remarkable wall-paintings and modelled figures of animals now extinct, which are not so much accurate copies of the beasts as idealised representations of them, evidently drawn and coloured under the influence of emotion. Bones have also been found carved in about the same period or engraved with the likenesses of similar beasts. All these are works of creative art of a high order. Other bones have been found evidently shaped to be used as utensils, and at the same time decoratively shaped into animal forms. This late Palaeolithic school of art stands alone as far as we at present know; but, of course, we cannot be sure that it was so, because they have only survived as by a miracle, whilst everything then and for thousands of years later made in perishable materials has naturally vanished. The Neolithic Age is more widely and variously represented, and decorated objects of many kinds have come down to us from it over widely scattered areas. Of its creative art we know nothing, but it does not follow that none existed. Neolithic culture was widely spread, and its traces have been discovered over all except the very north of Europe, all round the Mediterranean, up the Nile, and in many parts of Asia. During this period pottery was invented. In Egypt the neolithic people reached a high development, and formulated the type which Egyptian art afterwards followed. They wrought the hardest stones into polished vessels of beautiful form, they employed human and animal figures decoratively with skill, and they initiated the type

of Egyptian architecture. In Lower Mesopotamia a corresponding development went forward, though on a basis of clay instead of stone. In south Russia and the Danube district, with off-shoots down the Balkan peninsula and across into Asia Minor, what is known as the Tripolje culture flourished. It has left some very remarkable pottery, whose decoration suggests a widespread influence exerted by it on some art-groups of the Bronze Age. The Ægean likewise and Syria were early centres of nascent civilisation, and other centres have been identified along the Mediterranean coast and in west Europe. Towards the close of this epoch copper began to be used side by side with stone for utensils. This Copper or Eneolithic Age seems to have been relatively short, copper before long being replaced by the harder alloy, bronze. The Bronze Age produced remarkable schools of art in many parts of the world, from China in the Far East to Ireland in the West. It lasted roughly from about 3000 to 1500 B.C., beginning and ending sooner in some places than in others. The great schools of Ancient Egyptian, Chaldean, Elamite, Hittite, and Minoan arts flourished during this period. At the beginning of this age building with great stones (megalithic architecture) was popular, and examples may be cited from the pyramids of Egypt in the East to Stonehenge in Britain, the Egyptian works being, of course, earlier. Egyptian art, though not in itself religious, had its forms and subjects largely directed by the religion of its time and place. The preservation of the body or the likeness of the dead was essential in the estimation of every Egyptian. Hence arose mummification; hence also portrait sculpture for burial, and monumental sculpture for display. It was likewise essential to preserve the aspect of the ordinary occupations of life, because, by the intervention of Osiris, such representations were believed to be made real for the souls of the dead. Hence the number of incidents of everyday life depicted on the walls of Egyptian tombs, often with great skill, especially in the rendering of animal forms, the traditions of the treatment of which may have descended from a remote antiquity. The monumental architecture of Egypt was likewise encouraged by the same desire for permanence. In its earliest known forms (the pyramids, mastabas, &c.), it was an architecture of the tomb. The quantity of the harder rocks readily available helped to determine the nature of Egyptian art. Chaldaea is a stoneless country. Its arts chiefly depended upon the nature of clay for their forms. The Chaldeans (proto-Babylonians) wrote upon clay tablets, which were afterwards baked. They built with bricks, chiefly sun-dried. They employed the potter's wheel at an early date, and they found out how to enamel. Some of their buildings were covered with enamelled bricks. They imported stone, which they sculptured well (the statues from Tello in the Louvre), treating it as a precious thing. They were great magicians, believers in the power of many spirits capable of being represented by natural objects—a belief at first not far removed from fetishism. They therefore studied the motions of the heavenly bodies; and their temples were solid staged towers of sun-dried brick, raised above the mists of the plains. They invented the forms of winged men and animals to represent certain demons and spirits; the figures of angels also come to us from Chaldaea. The dome was a Chaldean invention. The wonderful discoveries made by Sir Arthur Evans at Knossos, supplementing the results of Dr Schliemann's excavations at Troy, Mycenae, and Tiryns, have thrown a flood of light upon the Bronze-Age culture of the Ægean. It now appears that Crete was a centre of art-life contemporary with Ancient Egypt

and Chaldaea, and having a style of its own no less remarkable than theirs. Cretan artists were influenced by, and in their turn influenced, the artists of Egypt. They produced beautiful examples of coloured pottery, works in the precious metals, painting, and small sculpture, and they exercised a wide-spread influence throughout the Mediterranean. In central and especially in northern Europe (Scandinavia) there were admirable craftsmen during the Bronze Age, and this was true as far off as Ireland. The development of the bronze spear out of the flint knife seems to have been accomplished in Britain. The sword grew out of the knife in the East.

When tools and weapons began to be made of iron, what is known as the Iron Age began. The transition from bronze to iron was gradual, and in Europe accompanied a considerable movement of the peoples. Most important was the coming down on to the Mediterranean region of hordes of less civilised peoples from the north. Achæans and presently Dorians overran the Ægean coast and put an end to Minoan art. At this time the Assyrians rose to power. Italy also was invaded by a new population. The Hittite power, flourishing in the highlands of Asia Minor and the north of Syria in those days, and possessing a culture of its own, must likewise be remembered; whilst the Phœnicians, settled on the Syrian coasts, and borrowing indifferently the arts and crafts of Egypt and Assyria, were active as a sea-trading folk, who incidentally brought the artists of one country into contact with the products of another. The destruction of the old-established schools, and the introduction of an entirely new purchasing or employing public, resulted in the gradual development of altogether new styles of art, in which old traditions from all quarters were mingled together. Greece was the centre where eventually all rays of ancient arts were focussed, and where the art of the new world arose during the 6th century B.C., to attain its first culmination in the 5th century. Asiatic, Egyptian, and Minoan forms, revitalised by the spirit of the new peoples from the north, produced the art which in the hands of the Greeks was destined to dominate the civilised world for a thousand years. It was under the influence of the passionate struggle of Greece against the Persian hosts that the Hellenic ideal took final form. It may be called an Ideal of Reserve. In architecture and sculpture alike this ideal reigns, culminating in the age of Pericles. Gods are represented in perfect human shape, without exaggeration of form or posture, and with little expression beyond an aspect of benevolent calm and satisfaction. After the Peloponnesian war the purity of this ideal passed away. Sculpture tended to become theatrical or portrait-like, and portraiture became the leading art. In Italy the Villanova style of the early Iron Age gave way before that of the intrusive Etruscans, oriental in origin, much influenced by the Phœnicians, and presently wholly dominated by the Greeks, especially in those parts which were colonised by Greek settlements. After the conquest of Greece by Rome, Hellenic influence in art became supreme. Roman artists, in the time of the empire, developed in architecture a style founded upon that of the Greeks, with certain oriental elements added. The dome and the semi-dome were very much employed by Roman architects. Fresco and mosaic were likewise much used. Portrait sculpture flourished.

Whilst Greek art was waxing and flourishing in the West, a more or less independent school in Persia was expressing and developing the traditional style of Babylonia; and these two great schools, Eastern and Western, have continued their existence, with various actions and reactions

on one another, from that day to this. The conquests of Alexander the Great for a time brought these schools into intimate contact. Hellenistic art, especially architecture, borrowed a good deal from the East, whilst in Bactria and north-west India arts sprang up with a strong Greek infusion. This Greco-Indian or Gandhara School, as it is called, which took its subjects from Buddhism, was the foundation from which all later important Asiatic schools took their origin. Its offshoots have been revealed by Stein in central Asia, and away off to China; whilst in India the style had a continuous development unbroken down to the present day. Roman Imperial art was a form of Hellenistic, which for three or four centuries maintained itself supreme throughout the whole Roman Empire. It was not, however, in Rome or the West that it flourished best, but rather in the great Hellenistic cities of its origin—Alexandria, Damascus, Oesiphon, and the cities of Asia Minor. Christianity for a long time had no effect upon the style of Roman art. Such works of art as the early Christians employed were in nowise different in style from that of their pagan contemporaries. Even the subjects chosen were adaptations of pagan subjects. When Constantine moved the capital of the Roman Empire to Byzantium, it was not Christianity which effected a change of style and the growth of the new Byzantine school, but it was the nearer proximity of the East and the influence of the contemporary and flourishing school of art in Sassanian Persia. Just as in the 5th century B.C. Greek and Achaemenian Persian art had flourished side by side, so in the 5th and 6th centuries A.D. Byzantine and Sassanian art blossomed together. At this time, however, a new school destined to a wonderful future was obscurely arising. To approach it lucidly we must for a moment retrace our steps. In the Bronze Age there had developed in Siberia and thereabouts a very prolific output of decorative art, of which the greatest number of existing remains are either in the museum of Minusinsk, near which place most were found, or in that of Petrograd. Objects in bronze of this style are found in a vast area from Lake Baikal in the east to the Dnieper in the west. The influence of the style is discoverable in bronze-work of the Danube basin and the Caucasus as well as in China. This is the ancient art of the Asiatic nomads, whose blood has fertilised the world, an art rude in its forms, but full of vigour and life. The Scythians, a branch of this great human horde, came in contact south of the Caspian with the Persians, and north of the Crimea with the Greeks. Works of art of fine quality made in gold have been found, of which some were the work of Persian, others of Greek, craftsmen. The Treasure of the Oxus in the British Museum represents the former; the latter are exemplified by the countless golden objects yielded by Crimean tombs to the Hermitage Collection at Petrograd, and only there to be studied. These date from a period ending towards the approach of the Christian era. In about the 3d century A.D. a new style of decoration applied to small objects of personal ornament is found arising in this region in and about the Crimea. It has been named the Bosphoran style, and appears to have been employed by a mixed population in which Greek and Scythian elements were combined. Not far away dwelt for a time a Germanic population of Goths, who had wandered down from the Baltic region. They adopted this style of art and made it their own, if it was not actually they who invented it. The eruption of the Huns out of Asia in the middle of the 4th century A.D. set the Goths in motion westward, and inaugurated the period of the Barbarian invasions. The kind of art liked by the Goths

commended itself also to the other barbarian tribes, and they carried it with them whithersoever they spread. As we know it, it was in the main an art of metal-work, especially goldsmithy, in which garnets, or, failing them, glass pastes, cut flat, were framed in gold or gilt cells or cloisons, or it consisted in covering the area of a bronze brooch or other small object with a decoration as elaborate as possible, in which beasts were often introduced, and in process of time so much contorted and elongated as to become a mere pattern of interlacing. Whether this kind of decoration was also applied to the embellishment of wooden architecture (which was the only architecture they used) we cannot say, but it is probable. The finest works of the kind were all of gold and jewels for personal ornament, the sort of art obviously best suited to an itinerant martial race who must take with them on their wanderings every precious possession they owned. In the 6th and 7th centuries this style of art flourished in every European country in which barbarian colonists had settled. In England it is Anglo-Saxon, in north France and Belgium Frankish, on the Rhine Frank or Allemannish, in south-west France and Spain Visigothic, in Italy Ostrogothic and Lombard. Only in Ireland and parts of England did the late Celtic forms of art maintain themselves, which had flourished there and in Gaul before the coming of the Romans, and even there the influence of the Teutonic beast-style was felt and to some extent amalgamated with the local style. Thus the school of Irish and Anglo-Saxon Celtic Christian art was formed, of which we shall have a word to say presently. All the barbarian schools were merely forms of the root school of the Gothic, and may be called Early Gothic together. They were not merely exercised by barbarian craftsmen, but equally, perhaps mainly, by east and west Roman craftsmen working for *nouveaux riches* barbarian princes and other employers. The tomb of Childeric (d. 481), father of Clovis, rendered up a characteristic group of the finest early works of the sort, quite possibly made at Constantinople, but in the barbarian style, to be given as a pleasing gift to a barbarian prince. In the 7th century, when more settled conditions had arisen, finer works of the kind were made, such as the wonderful Visigothic crowns of Guarazar in the Cluny Museum. By this time the style had taken firm root, and was practised by such considerable artists as Saint Eloy, bishop and minister of Dagobert. Of course, it was not uninfluenced by classical Roman traditions, but it was always stronger than they, and maintained its individuality in spite of them, only annexing from them what it could completely assimilate. One of the great influences that operated to spread Christianity among the barbarians came from Ireland. Irish missionaries brought Irish art with them, and that style was well suited to mingle with and influence, as it did, the purely barbarian style of their pagan days. East and west Roman manuscript illuminations also greatly affected the early barbarian schools of script embellishment, there being no other tradition to set off against them; whilst, as the barbarians had no stone architecture of their own, they naturally borrowed whole-heartedly from Rome and the East in this kind. Only fragments of Merovingian and Visigothic buildings remain, yet they are very unlike Roman. It was in north Italy that the first vigorous school of stone architecture of a new type arose. Structurally it followed Roman traditions, but no one could confuse a Lombard church with an ancient Roman building. The style, once formed, grew rapidly and spread abroad. We call it Romanesque, but it is really a Lombard style that, taking root in north France, became Norman, and as Norman was brought over to England.

In the decorative details of Lombard buildings, the forms of Early Gothic decoration as modified by the centuries are plainly visible. All through the 10th and 11th centuries it is still experimental, the great difficulty being to cover buildings over with a vaulted stone roof that would not fall in, and that could be adapted to whatever plan was required. It was in the process of solving this problem that what is universally known as Gothic architecture was invented, a kind of building in which the groined pointed stone vault determines the chief architectural features. This style emerged definitely in the latter part of the 12th century. It was, as we have seen, an ultimate outcome of the initiative first given to Europe in the 4th century by the invading Goths.

Meanwhile in the East a distinct art-development had been going on on lines of its own. When in the 7th century Islam sprang into being, and Moslem conquerors obtained possession of a vast territory, which presently reached from India northwards to Samarkand and west round the coast of the Mediterranean through Spain to the Pyrenees, this new style of art was supreme wherever the muezzin called to prayer. It was a style in which Sassanian, Egyptian, and Byzantine elements mingled. The craftsmen that handled it were largely Christian, but it was a new and truly Moslem style, for in all art, as in cooking, it is not the *chef* but the diner who determines the character of the *menu*. The centres of this art were the old centres in Persia, Mesopotamia, Syria, and Egypt. It cut itself off from many an old tradition by the prohibition (in orthodox districts) of the representation of the human form. All its strength was devoted to decoration, with the result that it produced in ceramics, glass, woven stuffs, plaster-work, carved ivory, &c. objects of a decorative splendour that have never been and can never be surpassed in their kind. When in the 13th century Gothic art was culminating in the north of Europe, Italy was in a relatively backward condition compared with France. The religious revival brought about by Francis of Assisi in the 13th century rapidly changed this state of things, and an intellectual revival followed. Fresco-painting improved under the hands of Cimabue, Giotto, and their followers at the end of the 13th and the beginning of the 14th century, who worked chiefly for Franciscan patrons. The Dominican revival soon succeeded, and then, in the 15th century, fine schools of art of all kinds flourished in various parts of Italy. The revival of classical study gave a new impetus to art. Ancient sculptures and buildings were studied and imitated, and about the commencement of the 16th century the culmination of this epoch of art was reached. Meantime, in the north of Europe, in the 15th century, painting had been cultivated with great success, whilst Gothic traditions were everywhere losing power. Under the influence of the mystic preachers a beautiful school of painting arose in the Rhine Valley in the 14th century, Meister Wilhelm and Meister Stephan of Cologne being its leading artists. At the beginning of the 15th century the centre of art-life in the North shifted to the Low Countries. There the Van Eycks made technical improvements in the method of painting, besides introducing the study of nature as the chief aim of their art. The Flemish school influenced all Germany, and generated the schools of Nuremberg, Augsburg, and other towns. When the classical revival spread north of the Alps Gothic art ceased, and the so-called Renaissance reigned everywhere.

The Reformation came, and for a time ruined the arts (with the exception of music) which had grown up in the service of the medieval church. In some

parts of Europe the old traditions lingered on longer than elsewhere. Portraiture survived longer than other forms of art, and indeed culminated in excellence when ideal painting was already on the decline. The life of the 16th century was a life of action, and the art of action (*drama*) was naturally the one most cultivated. Painting, then, was succeeded by drama, the age of Raphael by that of Shakespeare. Splendid schools of painting, however, flourished in the Low Countries and Spain when the art was enfeebled everywhere else. Under the protection of drama music also developed, and may be thought to have culminated in our own day. In the 18th century there was another revival of painting, and schools of a new character arose in different countries. These schools have developed in different directions, and felt the influence of the contemporary literary and scientific movements which have gone on about them. The Romanticists of Germany and the Pre-Raphaelites of England were thus produced. They have been followed by Impressionists, Post-Impressionists, Futurists, *et hoc genus omne*, about all of whom the future must judge.

The English style of painting was practically founded by Van Dyck in the reign of Charles I. He was succeeded by Sir Peter Lely, and he in turn by Sir Godfrey Kneller. Richardson, Hudson, and other mediocre painters followed, the mass of their work consisting of portraits. In the 18th century a revival was effected by Hogarth, Reynolds, and Gainsborough. Wilson painted landscapes in the classical style; Gainsborough introduced into the rendering of landscape a broader treatment of country scenes. Turner's art was primarily founded upon the classical style, but he united with that a direct appeal to nature, and by unbounded study he attained a skill of handling and a minute knowledge of nature in every mood such as has never before or since been attained. Constable carried on the traditions of Gainsborough, and strongly influenced the landscape-painters of France. The decline of landscape art in the present day is marked by increasing triviality on the one hand, and slovenliness on the other. There can be little doubt that the invention of photography, with its later developments of process-reproduction and of living pictures shown by the cinematograph, had a great influence upon contemporary art. When pictures were rare they were prized. Now we are overwhelmed by coloured reproductions of all the famous paintings in the world. We are thus liable to be sickened by too much sweetness. Moreover, when the only representations of living creatures that were to be had were drawings, paintings, sculptures, and so forth made by the hand of man, there was an element of marvel about any picture. Now photography has made the likeness of living things utterly common. Cheap newspapers are full of them. They are poured upon us by advertisers. We see pictures everywhere. The poorest can have almost as many as he pleases. They are no longer precious, and there is nothing surprising about any of them unless they are badly drawn, for the cheapest photograph draws correctly. Moreover, no picture can for a moment compete with the cinematograph as an agent for representation of actual facts about living people. We can still see Edward VII. walking, talking, smiling, far more vividly than any painter could ever have presented him. Thus the public is tired of pictures that correctly represent facts, and is indeed probably tired of any and every possible kind of picture. Hence the coming of post-impressionist art, which is bound to devote itself to decoration rather than merely to the painting of pictures which no one has wall-space left to hang. But if the days of painting are perhaps for the time over, the day of decoration

has returned, and we may expect the future to produce decorative arts which we hope in their kind may rival the finest that Sassanian, Byzantine, or Moslem artists ever imagined.

The impulse to decorate a useful object is one common to all mankind. It is merely to continue a little further the labour of simple manufacture. With this instinct is involved the equally natural impulse which drives men to imitate the objects seen about them, by which they are chiefly interested. Landscape-painting, for example, is suggested by the desire to fix upon some portable surface the image of a view which pleases or interests the draughtsman. But out of this effort at imitation arises a new desire—that of creation. The artist is not satisfied merely with attempting to copy what he sees. The study of nature fills his mind with thoughts of beauty; he conceives persons and scenes which he has never beheld, and the impulse arises in him to give visible form to such conceptions, to transfer the idea from his own mind to that of another. Works produced in this spirit are new creations, and take rank as the highest form of art. Their excellence is determined by a twofold test. Is the thought itself fine? has it been duly expressed? In the works of early schools of art we often meet with the finest thoughts expressed by very undeveloped means, and yet completely. In works of a declining school the expressive power of the artists is generally great, but their thought feeble or mean. Complete powers of expression, themselves beautiful, and fullness of lovely and ennobling thought, are the marks of a culminating school. Every school of art arises in the wake of some new ideal which it endeavours to express. Some ideals are best expressed in monumental buildings, like the ideal of Persistence of the Egyptians. The Greek ideal of Reserve found its clearest expression in perfect sculpture. Each ideal exercises a formative power, and directs at once the desires and the hands of men. It wins for itself, step by step, clearer and nobler expression, and enjoys a brief time of perfect life. Then a decadence sets in, and after a longer or shorter period of transition or barrenness, another ideal arises to produce a new art. Such a transition can best be watched taking place in the 15th century, between the mediæval ideal, which produced chivalry, feudalism, and Gothic architecture, and the Renaissance ideal, which produced the study of antiquity, the revival of learning, a tendency towards despotism in government, and the great schools of painting in Germany, Italy, the Low Countries, and Spain. It follows from this, that in every epoch there is one dominant art to which the rest are subsidiary. In the 13th century architecture ruled. Painting and all the minor arts derived their forms from those developed in the service of architecture. The very binding of books was decorated with bas-reliefs. Ivory carvings were like little buildings.

It is impossible to draw a sharp line of division between fine and decorative art. Sculpture primarily intended to decorate a building may be (as in the case of Notre Dame at Paris) amongst the finest, considered as pure sculpture. In a time of artistic culmination, almost everything that is made is endowed with somewhat of the splendour of the supreme art. Nevertheless, one law can be stated to which all art, primarily decorative, must conform. Decoration must not interfere with the utility of the object decorated, but must rather express, or at all events be conformable (in spirit as in shape) to, that utility. Giving to this same principle a wider application, we may deduce from it the law, applicable to all art whatsoever, that the material in which a work of art is executed must to some extent govern the style of the

work. There is one style suitable for sculpture in granite, another for sculpture in marble, another for metal, another for wood. A figure rightly carved in the one substance would be wrong if copied into another. Again, the process of working has also to be taken into consideration in the design. A cartoon for a painting would not be suitable for translation into a stained-glass window, a tapestry, or a mosaic. In line-engraving, the lines are ploughed into a copperplate by the direct application of the strength of the engraver's arm. In etching, the copperplate is first covered with varnish, and then the varnish is scratched off in fine lines by the point of a needle. The lines are afterwards bitten in by the chemical action of an acid. The artist's hand acts in the one case deliberately and with force, in the other swiftly and lightly. What, therefore, is suitable treatment in line-engraving is unsuitable in etching, and *vice versa*. In pen-and-ink drawing, the pen lays black lines on a white surface. In wood-engraving, the white spaces are cut out, and what is to print black is left standing in relief. A good pen-and-ink drawing, therefore, will make a bad woodcut.

All the decorative and many of the creative arts may likewise be considered as 'glorified handicrafts.' As long as an object is only intended for use, it is not a work of art. An object made purely for use may indeed be beautiful. If, like a ship or a water-wheel, it is made to be as it were used by the forces of nature, its forms are then as much dictated by the action of the forces of nature as the forms of a cloud or a hill, and it shares the beauty of all natural objects; but it is not a work of art. It is only when the workman goes beyond what is necessary for use, and consciously aims at giving also pleasure by his work, that he becomes an artist. Weaving is not an art, but tapestry-making is; it is the glorified handicraft of weaving.

Much has been written about the artistic or inartistic nature of certain peoples. Thus the ancient Greeks are considered an artistic race, the Romans inartistic. In all probability there is an artistic potentiality in every people. The ideal of the Greeks was representable, and their circumstances were at the time favourable to its representation. The Romans were chiefly employed in the government and administration of a large empire. Their ideal was not representable, and their energies were fully occupied in developing it in other than artistic directions. It is not the natural gifts so much as the condition and circumstances of a people at a given date that determine whether it shall be artistic or not. The French in the 13th century were the most artistic people in Europe. In the 15th century the French produced relatively little of supreme excellence, whilst the Italians had in the meantime gone to the front. Art is primarily an expression of happiness, and a product of passion in leisure. When the passions of a race are fully occupied in the business or troubles of life, art languishes. It grows strong when a strong race is enabled by circumstances to devote its strength to joy. The passion of life in the present day is chiefly enlisted in scientific discovery. Art, therefore, is not the first thing in the life of any existing nation, and no supremely great school is at present culminating.

ART INSTRUCTION has to secure the power of outlining correctly in pencil from a copy, and after this has been attained, the pupil proceeds to add light and shade to his previous work in outline. The next step is to draw—or, if a sculptor is being trained, to model in clay—from the object itself, and for this purpose plaster casts of fruit, flowers, and leafage, and afterwards casts of statues, form the most convenient models. When sufficient power has been gained by these exercises, the pupil enters

the life-school, and works from the draped and the undraped human figure; if a sculptor, modelling the subject in clay; if a painter, rendering it in light and shade, and afterwards in colour. On leaving the life-class he is free to choose his own special department of art, but for the landscape-painter, and even for the decorative designer, as for the sculptor and the figure-painter, the fittest preparation and the most searching training lies in study from the human figure, though the latter require a knowledge of anatomy which is unnecessary in the case of the former. The training of the painter includes instruction in the various technical processes of oil and water-colour painting, as that of the sculptor includes instruction in the qualities and capabilities of the marble and other materials with which he works; while the architect requires a wider scientific knowledge, and a full acquaintance with the laws of mechanical construction.

In the early times of art the painter or sculptor was trained like any other craftsman. He entered the studio of some recognised practitioner of the art to which he meant to devote himself; and began, if under a painter, to prepare colours and to ground canvases, learning all that his master had to teach him; and finally he took part in the production of the monumental frescoes and even of the easel-pictures which were given to the public under the master's name. Gradually, however, the fine arts began to separate themselves more sharply from the other crafts. Their professors assumed a higher status than formerly. It became more and more the custom that an artist should finish with his own hand every portion of each work which issued from his studio. Academies of art were formed, and, in connection with them, art training was conducted by certified instructors. Thus a class of art-teachers, as distinct from artists, arose, a change not altogether favourable in its influence upon the future of art.

In England, one of the first efforts in the direction of systematic art training was made by Sir Godfrey Kneller, who in 1711 founded an institution for giving professional instruction in design. In 1724 Sir James Thornhill established a similar academy in his own residence; but several students seceded from his class, headed by John Vanderbank, who started a short-lived academy, in which study from the life was introduced. This was followed by the well-known St Martin's Lane Academy, founded by William Shipley, where for thirty years those who afterwards became the leading artists of the time received their training. It was superseded by the schools instituted by the Royal Academy after its foundation in 1768.

The establishment of the South Kensington Department of Science and Art marks an important epoch in the history of art instruction in England. It may be said to have arisen out of the report of a select committee of the House of Commons appointed in 1835 'to inquire into the best means of extending a knowledge of the arts and principles of design among the people (especially the manufacturing population) of the country.' On the recommendation of this committee a sum of £1500 was devoted to the establishment of a Normal School of Design, with a museum and lectures. The school was opened in 1837, and by 1851-52 the government grant for this school and its various branches throughout the country had attained the amount of £15,055. In 1852, in accordance with a report of a select committee, the scheme was reconstructed, and a 'Department of Practical Art' created, with Sir Henry Cole, K.C.B., as superintendent; and a Science Department was added in 1853. It was under the management of the Board of Trade till 1856, when it passed under the control of the Lord President and the Vice-

president of Council on Education. The Department of Science and Art was united with the Education Department to form the Board of Education in 1899, and the Royal College of Art was reorganised. The South Kensington Museum, founded in 1851, has played an important part in the art education of the country, and perhaps entirely for good. See *South Kensington and its Art Training*, by Frank P. Brown, A.R.C.A. (1912).

In 1869 a great stimulus to art education was given by the foundation, through the bequest of £45,000 by Felix Slade, of the 'Slade Art Professorships' in the universities of Oxford, Cambridge, and London. These chairs have been held by Ruskin and other persons of the highest eminence.

In Scotland a remarkable effort in the direction of art instruction was made by Robert Foulis, the well-known printer. In 1751 he visited the Continent, engaged drawing-masters, and purchased pictures, casts, and engravings; and on his return to Glasgow in 1753 he started a school of art. The classes were continued till about 1776, and were far from a pecuniary success; but they afforded training to such excellent artists as David Allan and James Tassie, and exercised a most important and beneficial influence upon Scottish art. In 1760 the Board of Manufactures in Scotland founded a school of art in Edinburgh which, under the name of 'The Trustees' Academy,' afforded instruction to almost every Scottish painter of distinction for a century and a half. In 1858 this school was affiliated with the South Kensington Science and Art Department. Its functions, and those of other schools, were taken over by the Edinburgh College of Art, founded by the Town Council in 1908 to teach painting, sculpture, architecture, and design. In 1880 art instruction was brought within the scope of the Scottish university curriculum by the establishment of the Watson-Gordon chair of Fine Art in the University of Edinburgh, in memory of Sir John Watson-Gordon, F.R.S.A., through the bequest of a sum of about £12,000 by his brother and sister.

In Ireland there are classes in connection with the Royal Hibernian Academy for study from the antique and the life; and the Dublin Metropolitan School of Art is under the Department of Agriculture and Technical Instruction.

Various Continental schools, especially those of Munich and Antwerp, have attained celebrity; but Paris is now the great centre of art instruction, in which many British and American students have been trained. Since the time of J. L. David—who, when in exile, also influenced the school of Belgium—the French have been celebrated for their command over form; and, in recent years, their power as colourists has greatly increased. The Parisian method of study is admirably adapted for giving its pupils a certain technical dexterity. The *Prix de Rome* of the French Academy is a much-coveted distinction, ensuring a residence for study in the Villa Medici, Rome.

See *ÆSTHETICS, ANTHROPOLOGY, ARCHITECTURE, ENGRAVING, IMPRESSIONISM, PAINTING, SCULPTURE, &c.*; and for the other fine arts such articles as *MUSIC, DRAMA, POETRY*.

Arta (Turkish *Narda*, the ancient *Ambraciu*), capital of a division of Epirus, ceded to Greece by Turkey in 1881 (area, 700 sq. m.; pop. 50,000). The town stands on the left bank of the river Arta (the ancient *Arachthos*), 8 miles from its mouth in the Gulf of Arta (the ancient *Ambracian Gulf*), an arm of the Ionian Sea. It is the see of a Greek archbishop, and has a considerable trade. It was on the Turkish frontier till 1912-13. Pop. 10,000, of whom more than two-thirds are Greeks.

Artabazus, the name of several distinguished Persians under the dynasty of the Achemenidae. When Xerxes advanced against Greece, an Artabazus led the Parthians and Chorasians. At a later period he warned Mardonius, but in vain, against engaging in battle at Platea; and on his defeat fled with 40,000 men, and reached Asia in safety.—Another Artabazus was general under Artaxerxes II., revolted against Artaxerxes III., but was forgiven, and served Darius faithfully.

Artagnan, COUNT D' (1612-72), prototype of Dumas's hero of the *Trois Mousquetaires* cycle, a Gascon who, under the Duc de Nemours, commanded the Royal Guards, arrested Fouquet, and fell at the siege of Maastricht. See his *Memoirs* (translated by Nevill, 1899-1900).

Art and Part. See ACCESSARY.

Artaxerxes (ancient Persian *Artakshathra*), the name of several Persian kings. (1) **ARTAXERXES I.**, surnamed *Longimanus* ('long-handed,' no doubt from his wide-reaching power), the second son of Xerxes, after the conspiracy of Artabanus, which caused the death of the king, put to death his elder brother, and ascended the throne in 465 B.C. His long reign, extending for forty years, was marked by a decline of power.—(2) **ARTAXERXES II.**, surnamed *Mnemon* ('the mindful'), succeeded his father, Darius II., in 404 B.C. After the death of his rebellious brother Cyrus in the battle at Cunaxa, he became involved in war with Sparta, which ended with the peace of Antalcidas. He died in 358.—(3) **ARTAXERXES III.**, named *Ochus*, was the son and successor of the preceding. He found the empire falling to pieces, but did much to build it up again, and stave off the coming ruin. After putting down the revolts of Artabazus and Orontes, he subdued Phœnicia and Egypt, and reduced Cyprus. He mainly owed the conquest of Egypt to his general, Mentor, and him he rewarded with the satrapy of the west coast of Asia Minor. He outraged the religion of the Egyptians by desecrating their temples and slaughtering their sacred animals. He was poisoned in 338 by his favourite eunuch, Bagoas.—(4) **ARTAXERXES**, or Ardeshir, the founder of the new Persian dynasty of the Sassanidae, overthrew Ardavan (Artabanus), the last of the Parthian kings, and was hailed as 'king of kings' on the battlefield in 227 A.D. He next conquered Media and a large part of the Iranian highlands, but had less success in Armenia, and was defeated by Alexander Severus in a great battle in 233. He made most of the former vassal states of the Arsacidae into provinces of an empire, which he consolidated so well that it endured for four hundred years. He died in 242.

Artedi, PETER, a celebrated Swedish naturalist, was born in 1705. He studied for the church at Uppsala, but soon betook himself to the natural sciences, having Linnæus for fellow-student and friend. He became specially distinguished in ichthyology; and having gone to England in 1734, he there completed his great work, the *Ichthyologia*, the first which gave a truly scientific character to the study of fishes. He was also a distinguished botanist. He went to Leyden in 1735, and in the same year was drowned in a canal near Amsterdam.

Artemis, a goddess of Greek Mythology, daughter of Zeus and Leto, twin-sister of Apollo, born with him in Delos, whence she is often called *Ortygia* from the ancient name of the island, or *Cynthia* from Mount Cynthus there. To the Greeks she was (1) a kind of feminine Apollo, armed like him with the bow, dealing plagues and death to beasts and men, but also healing diseases and averting evils. She has a special care over the

young of animals, and is therefore the goddess of the flocks and the chase. Her heart has never yielded to love. She slew Orion for an attempted insult, and changed Actæon into a stag simply because he had seen her bathing. As the sister of Apollo, regarded as identical with Helios ('the sun'), she came to be regarded as the goddess of the moon, corresponding to Selene, and latterly the worship of the two was amalgamated. (2) The Arcadian Artemis is merely a goddess of the nymphs, hunting together with them on the Arcadian mountains, drawn in a car by four stags with golden antlers. (3) In Attica and Sparta the goddess was worshipped under a somewhat sterner aspect, and the usages point back to original human sacrifices. According to tradition, Iphigenia, who had herself been about to be sacrificed to the goddess, brought her image from Tauris and set it up at Brauron in Attica, whence *Brauronia* became a name of Artemis. At Sparta boys were scourged at her altar until it was sprinkled with their blood. (4) The goddess worshipped as Artemis at Ephesus was originally, according to Hogarth, an archaic Greek type of woman; the many-breasted figure was a late Hellenistic importation or invention (according to the result of excavations at Ephesus). Frazer insists that Artemis was nowhere a chaste vestal, but typified the fecund forces of nature, and was even associated with child-bearing. See Acts xix.

By the Romans Artemis was identified with the ancient Italian divinity Diana, a goddess of light, representing the moon, corresponding to Dianus or Janus, a god of light, the sun. The attributes proper to Artemis were attached to her name.

In art Artemis is represented as a young and handsome huntress, her hair tied up around her head, modestly clothed in the chlamys, but with the legs bare below the knees. She carries the bow and quiver of arrows, and is attended by dogs or stags. As the moon-goddess, again, she is clothed in a long robe, her head covered by a veil, above her brow the crescent of the moon. Her most famous statue is the 'Diana of Versailles,' found in Hadrian's villa near Tivoli, now in the Louvre.

See **ASTARTE**, **DIANA**, **NEMI**; Claus, *De Dianæ antiquissima apud Græcos natura* (1881); Schreiber's 'Artemis' in Roscher's *Lexikon der Mythologie* (1884-1905); Frazer, *The Golden Bough* and the *Fortnightly*, Dec. 1904; and Hogarth's *Excavations at Ephesus* (1908).

Artemisia, queen of Caria from 352 to 350 B.C., was the sister and wife of Mausolus, and is celebrated for the magnificent mausoleum which she caused to be erected to her husband's memory (see **MAUSOLEUM**).—Another Artemisia, queen of Halicarnassus, accompanied Xerxes, with five ships, in his expedition against Greece, and distinguished herself at the battle of Salamis (480 B.C.); she ended her life, in consequence of an unfortunate attachment, by leaping from a rock.

Artemisia. See **WORMWOOD**.

Artemus Ward. See **BROWNE**, C. F.

Ar'teries (Gr. *artēria*, probably from *air-ein*, 'to raise,' but by some connected with *air*, 'air,' from the old idea that these tubes were air-carriers, since after death they are generally found empty), the vessels through which the blood passes from the heart to the tissues. The structure of an arterial tube is very complex, and a section of it may be roughly subdivided into three layers, called the coats of the artery: an external, consisting of interlacing bundles of fibrous tissue mixed with elastic fibres, which in large vessels such as the aorta are gathered together to form an elastic layer; a middle, which is muscular, contractile, and brittle, the fibres being arranged in a circular

direction; an internal, also brittle, the free surface being smooth and formed of a single layer of endothelial cells. External to these cells there is a layer of delicate connective tissue, outside which there is the elastic layer constituting the bulk of the inner coat, and distinguished by numerous perforations, causing its fenestrated appearance. The tube is also enveloped in cellular tissue, termed the *sheath* of the artery. When an

artery is wounded by a sharp instrument, the effect varies with the direction of the cut. Thus, if longitudinal, the edges may not separate, and the wound may heal without much bleeding; if oblique or transverse, the edges gape; and a nearly circular orifice allows of a profuse hemorrhage. If the artery be completely divided, its walls do not collapse like those of a vein, but pass through certain changes provided by nature to prevent fatal bleeding. The cut orifice contracts, and also retracts into its cellular sheath; this checks the flow of blood, a clot of which shortly forms on the outer side; then another forms inside the vessel; and together, they stem the flow, till the cut edges of the artery have time to throw out lymph (see ADHESION), and heal as wounds of other tissues. When an artery is compressed by a ligature, the brittle inner and middle coats crack and curl inwards. The interior of the vessel becomes filled with a clot which extends as far as the nearest collateral branch. Gradually the clot is absorbed and fibrous tissue deposited in its place, the result being that this part of the artery is entirely obliterated. See BLEEDING.

The arteries of the human body consist of two groups—those belonging to the lesser or pulmonic circulation, and those belonging to the greater or systemic circulation. All the offshoots of the latter group are branches, more or less direct, of the aorta. As each main trunk passes into a portion of the body, it divides into two principal divisions: one, which breaks up into branches for the supply of the tissues in the vicinity—the artery of *supply*; and another, which passes almost branchless to supply the parts beyond—the artery of *transmission*. These, however, anastomose freely (see ANASTOMOSIS), so that the distant tissues are not solely dependent for their supply on only one arterial trunk. Thus the femoral artery divides in the groin into the profunda or *deep* femoral, to supply the thigh, and the *superficial* femoral, to supply the leg below the knee. Again, the common carotid divides into the *external* carotid, to supply the neck and head, and the *internal* carotid, to supply the brain. Although arteries have generally the same distribution or arrangement of branches, they frequently vary, and thereby are apt to puzzle a superficial anatomist. Some of the varieties are so common that it becomes difficult to decide which is normal. These peculiarities are often found as constant forms among lower animals, but in many cases they may be due simply to enlargement or diminution of vessels already existing. The principal arteries will be considered under their distinctive names, as at

Aorta (q.v.); and see CIRCULATION, BLOOD, HEART, VEIN.

DISEASES OF ARTERIES.—Arteries, like other organs of the body, are liable to acute inflammation (Arteritis); but this rarely occurs except as a consequence of inflammation in the neighbourhood of the vessel, or of obstruction of its tube (see below). By far the most common and important disease affecting arteries is Atheroma (from Gr. *athērē*, meal). Atheroma is commonly a disease of advanced life, but may be found at any age. Its occurrence is favoured by any cause which produces greatly increased arterial pressure (occupations or amusements involving very great physical exertion, excessive use of alcohol), probably also by syphilis. It commences with a chronic inflammation, with greatly increased formation of cells in the outer layers of the inner coat of the arteries, perhaps also in the middle coat. This infiltration causes destruction of the natural tissues of these coats, and consequent loss of elasticity and contractility in the parts of the artery affected. The inflamed portions of tissue undergo fatty degeneration, and may either (a) become so softened as to be carried away by the blood-stream, or, more commonly, (b) become gradually calcified—i.e. converted into bony plates by the deposition in them of chalky matter. (a) A portion of the wall of an artery weakened in this way rarely becomes perforated, but frequently yields to the blood-pressure, becomes dilated, and forms an *Aneurism* (q.v.). (b) Calcification is much commoner, especially in old people, and may frequently be recognised in the superficial arteries by the hard feel the vessel has under the finger.

Atheromatous deposit is at first attended with a narrowing of the calibre of the vessel, varying with the thickness of the deposit, and most marked at the points of bifurcation. Smaller arteries may be completely obliterated, whilst the larger arteries may be very much contracted. Thus the common iliac has been found to have its canal diminished by about one-half, and the great ascending branches of the arch of the aorta, the subclavian and carotid arteries, have been found very nearly closed. A later consequence of the same disease is dilatation of the vessel. The elasticity of the outer coats being insufficient to contract the artery after the distension produced by each contraction of the left ventricle of the heart, it remains distended during the relaxation of the ventricle, and thus slowly expands; the enlargement being most marked at parts where there is most obstruction to the blood-current, as, for example, in curved arteries. These changes have also an effect on the retractile power of the arteries. A healthy artery, if cut across, may shorten to the extent of an inch or more; but the retractile power is destroyed by the deposition of bony rings or plates. But although incapable of shortening, the arteries sometimes become abnormally lengthened, and consequently become not only dilated, but also tortuous. All these changes produce great interference with the normal circulation of the parts whose arteries are affected; and where the disease is advanced, a cause that would otherwise be trivial may lead to serious results—e.g. softening of the brain, gangrene of the limbs, &c.

Another condition involving much danger is this: an ossified artery loses the smoothness which the interior of the vessel ought to present, and from the displacement or cracking of a bony plate, there may be sharp rough projections exposed, to which the fibrin of the circulating blood may adhere. These little clots becoming detached, may be carried with the blood till they become arrested, and plug up an artery, thus presenting cases of embolism or Thrombosis (q.v.). Again,

the relation of this disease to accidents and surgical operations on arteries is obvious. A blow or strain may rupture a diseased artery, when a healthy elastic vessel might have escaped injury. Such a slight movement as suddenly lifting the arm to the head, for the purpose of securing the hat in a sharp gale, has been known to be followed by aneurism of the axillary artery (Syme). A ligature applied to any calcified artery is very apt to cause it to break, and the difficulty of securing such vessels is often very great. It is to this form of disease that most of the failures of operations for aneurism are due.

Atheroma can be detected in the living subject only in its advanced stages, and its presence is often revealed by the occurrence of some secondary disease or symptom.

Another form of chronic inflammation of the arteries is met with in syphilis. It consists in a uniform thickening of the inner coat of the vessel, without the degenerative changes of atheroma, but with great diminution of its calibre, and consequent interference with the circulation. It is best seen and most important in the brain, where it often leads to softening.

Embolism is the name given to the obstruction of an artery by a plug carried to it from another part of the body. This may follow atheroma (see above), but is most commonly a consequence of the detachment of a mass of fibrin from a diseased heart. Any artery may be obstructed by embolism; the consequences are most serious in the brain, the retina, and the limbs. In the larger arteries of the brain, embolism causes symptoms and results very similar to Apoplexy (q.v.); in the retina, it causes sudden and often complete loss of vision (see EYE).

When the principal artery of one of the limbs is 'suddenly plugged in its higher part, a sensation of severe pain is commonly the immediate result of the accident. In some cases, the pain extends along the course of the vessel, which, though pulseless, is extremely tender; in others, the suffering is referred to some distant part of the limb, as, for instance, to the calf. Signs of a deficient circulation succeed, and they may amount to pallor, loss of temperature, numbness of the surface, or even to that torpor which is observed to precede the total death of a limb in certain cases of injuries of vessels.' Although Gangrene (q.v.) is always to be feared as the result of an obstructed artery of large size, it does not invariably follow; as a collateral circulation may be established, and the life of the limb may be thus saved. Very young persons will endure the obliteration of very large vessels without gangrene; and a case is on record in which 'all the main arteries of both upper extremities and of the left side of the neck were reduced to solid cords,' and yet no gangrene ensued. From the description of the symptoms, the nature of a case of sudden occlusion of a large artery by a plug may possibly be recognised, or at all events suspected, even by a non-professional observer. Medical aid must at once be sought. The early indications of treatment are to preserve the temperature of the part, to favour the establishment of a collateral circulation, to protect the limb from irritation or injury, to give nourishing blood-making food, and to relieve pain by the judicious use of opiates. The later treatment, if the affection is not checked, is that which is described in GANGRENE.

Arteriotomy, or the opening of an artery, is an operation that has been strongly advocated in those cases in which it is desirable to produce a more decided and immediate depletion of the brain circulation (as in severe forms of bleeding on the brain) than could be produced by ordinary

venesection. It is supposed by some surgeons to relieve pressure on the brain more efficiently than opening the jugular vein could do; and whether this is the case or not, it is a simpler and less dangerous operation. The only vessel operated on is either the temporal artery itself or one of its main branches, which is partially divided and allowed to bleed. The operation is a simple one, but should of course only be undertaken by a surgeon. To arrest the flow of blood when sufficient has been taken, the artery should be completely divided to allow its cut ends to retract; and after the surrounding parts have been sponged, a small antiseptic pad should be applied to the wound, and secured by a bandage, which must be carefully adjusted, so as, if possible, to remain undisturbed for four or five days, when it may be removed, and the wound covered with a strip of adhesive plaster.

Artesian Wells are perpendicular borings into the ground, through which water rises from various depths, according to circumstances, above the surface of the soil. The possibility of obtaining water in this way in a particular district depends on its geological structure. All rocks contain more or less water. Arenaceous rocks receive water mechanically, and according to their compactness and purity, part with a larger or smaller proportion of it. A cubic yard of pure sea-sand can contain about one-third of its bulk of water. It would part with nearly the whole of this into a well sunk in it, and regularly pumped from. Chalk and other rocks, composed of fine particles, closely compacted together, contain as large a proportion of water; but from the power of capillary attraction, little or none of this water would be drained into a well sunk in such rock. From the existence, however, of numerous crevices in chalk through which the water freely flows, and from the general presence of a larger quantity of water than the porous rock is able to retain, wells sunk in chalk often yield water. There is yet a third class of rocks, which are perfectly impervious to water; such are clays, which are strongly retentive, neither allowing water to be obtained from them nor to pass through them. When such rocks occur in Basins (q.v.) in alternating layers, and in such order that pervious beds are inserted between impervious ones, it is evident that if a perforation is made through the retentive barrier-bed in the lower portion of the basin, the water contained in the water-logged strata will rise through the bore to a height depending upon the pressure of water which has accumulated in the confined sloping space between the two impervious beds. The explanation will be more evident by a reference to the accompanying figure, which may be considered as a diagrammatic section of the London

Section of the London Basin

basin. There are here a number of porous beds, *b*, *c*, composing the chalk formation, resting on the impervious gault, *aa*, and these, again, are covered by the equally impervious series of the London clay, *cc*, which form the strata on the surface, and extend to a considerable depth. The edges of the chalk-beds are largely exposed in the higher grounds around London; the water falling on the

whole area of these exposed edges sinks into the more or less porous chalk formation, and would in course of time, by continued accessions, fill up the basin were it not prevented by the clay above. By driving a bore, *a*, through this superior bed the inferior water-logged strata are reached, and the subterranean water rises to the surface, and flows continuously, by means of hydrostatic pressure.

Many such wells exist in London and its vicinity; those which, since 1844, have supplied the ornamental fountains in Trafalgar Square descend into the upper chalk to a depth of 393 feet. The most famous artesian well perhaps is that of Grenelle, near Paris, which was bored in 1833-41, and whose water is brought from the gault at a depth of 1798 feet. It yielded at first 700,000 gallons a day, the water rising 122 feet above the surface; temperature, 81° F. Its present yield is 70,000 gallons—the water now rising only 32 feet. An artesian well bored at Pesh in 1868-79 yields, at a depth of 3182 feet, water of a temperature of 165° F. In the United States numerous artesian wells have been sunk, some of great depth, among which are two in St Louis, Missouri, 2197 and 3843½ feet deep respectively; one in Louisville, Kentucky, 2086 feet; one in Columbus, Ohio, 2775½ feet; one in Pittsburgh, 4625 feet, with many others from 500 to 2000 feet.

The Chinese and Egyptians were early acquainted with artesian wells. The oldest known in Europe is at Lille, in Artois (hence the name *Artesian*), and was sunk in 1126. They have been in use for centuries in Austria, especially in the neighbourhood of Vienna, where formerly the boring for them was conducted in a rude and empirical manner. As soon as geology took the position of a science, and the theory of artesian wells was propounded, the engineer was able, after the geological survey of a district, to discover whether a supply of water could there be obtained in this way. Already districts formerly dry and arid have received a plentiful supply of water by means of such wells, and many more applications have yet to be made. Artesian borings have been executed in the Sahara from remote antiquity, and new ones have been opened by the French in the Algerian Sahara with remarkable success, and great benefit to the country and the nomad Arabs, who settle down round the wells. In the drier regions of Australia the supply of water from artesian bores is of great and increasing importance. The most important basin, about 569,000 sq. m. in area, extends under the northern half of the Australian alluvial plain, and is bounded on the east by the Dividing Range (along whose western foothills the intake beds outcrop over 60,000 sq. m.), on the south by the Bogan and Darling Rivers and lat. 31° S., and on the west by the Great Western Tableland (see AUSTRALIA, *Physical Features*). Its main outlet seems to be to the Gulf of Carpentaria, but a minor outlet is indicated by the existence of numerous 'mound springs' in Central Australia. Professor Gregory (*The Dead Heart of Australia*, 1906) regards the water contained in this basin as largely of plutonic origin, a temporary accumulation which may be soon exhausted; but the general opinion of scientific observers in Australia itself favours a meteoric origin, and attributes the undoubted slackening of the supply in some bores to the corrosive action of the water on the impure iron of the pipes. The whole question is still under investigation. Seventy-five per cent. of the flowing bores are in Queensland, where a depth of 5045 feet and a flow of 4½ million gallons a day have been attained.

Smaller artesian basins occur (*a*) on the border between Victoria and South Australia; (*b*) in five areas along the coast of Western Australia, the

most important being at the head of the Bight—where artesian wells may facilitate the working of the transcontinental railway—and in the coastal plain north of Perth.

The quality of the water makes it chiefly useful for grazing areas. It is almost always fit for stock to drink, and often for man, but the contained 'alkali' seems in nearly all cases to make regular irrigation with it impossible. The most systematic use of it is made in New South Wales.

Artesian wells have supplied a portion of the data upon which the internal temperature of the earth has been calculated. They have their origin below that zone which is affected by the changing superficial temperature of the seasons, and consequently the water is of a constant temperature. Thus the Grenelle artesian well has a temperature of 81.7° F., while the mean temperature of the air in the cellar of the Paris Observatory is only 53°. Arago and Walferdin observed the temperature as the work proceeded, and found that there was a gradual and regular increase downwards. Walferdin also made a series of observations on the temperature of two boings at Creuzot, within a mile of each other, commencing at a height of 1030 feet above the sea, and going down to a depth, the one of 2678 feet, the other about 1900 feet. The results, after every possible precaution had been taken to ensure correctness, gave a rise of 1° F. for every 55 feet down to a depth of 1800 feet, beyond which the rise was more rapid, being 1° for every 44 feet of descent.

Artevelde, JACOB VAN, a Flemish popular leader in the 14th century, was a wealthy and high-born brewer of Ghent. In 1335, when war was raging between England and France, he gave his support to the former power, while the Count of Flanders sided with the latter; and he actually concluded a treaty with Edward III. Proclaimed governor of Flanders, for nine years he was almost absolute ruler; but he went too far when, in 1345, he proposed that the Black Prince should be elected Count of Flanders. For this the Flemings were not prepared, and Artevelde was killed in a popular insurrection, July 24, 1345. His son PHILIP VAN ARTEVELDE in 1381 headed a new revolt of the people of Ghent, and gained a victory over the Count of Flanders, the son of his father's old enemy. The count therefore sought the assistance of Charles VI. of France, and Philip was defeated and slain at Roosbeke, 1382. His history forms the theme of a fine drama by Sir Henry Taylor See Hutton, *James and Philip van Artevelde* (1892).

Arthritis, inflammation of the joints. See JOINTS, RHEUMATISM, GOUT.

Arthropoda, a group of animals with jointed appendages. It is a phylum or sub-phylum—i.e. a series of related classes—and is allied to the Chætopods (bristle-footed worms). In both the body is made up of a series of segments, typically bearing appendages, and the central nervous system consists of dorsal supra-oesophageal ganglia, a ring-like commissure around the gullet, and a ventral chain of ganglia. In Chætopods the appendages are unjointed parapodia, while in Arthropods they are typically plated with Chitin (q.v.) and divided into joints. Even more distinctive is the fact that some of the appendages in Arthropods are brought into the service of the mouth as jaws—a transformation which does not occur in Chætopods. The Arthropods also differ from Chætopods, and agree with one another in the nature of the circulation, the body-cavity, the pre-oral region of the body, the brain, and the excretory organs.

Arthropods include a number of classes: Crustacea (such as crabs, lobsters, shrimps, prawns, barnacles, 'water-fleas'); Arachnida (such as

spiders, scorpions, and mites), along with which the extinct Trilobites and Eurypterids and the King-crabs (with one extant genus, *Limulus*) should perhaps be ranked; Onychophora (Peripatus and its relatives); Diplopoda or Millipedes; Chilopoda or Centipedes; Insects; and some doubtful classes, such as the Tardigrada or Bear-animalcules. See Sir E. Ray Lankester's *Treatise on Zoology* and A. Sedgwick's *Student's Text-book of Zoology*.

Arthroscope, a resting-cell in the Bacteria (q.v.)

Arthur, a legendary king represented as having united the British tribes in resisting the pagan English invaders, and as having been the champion not only of his people, but also of Christianity. He is said to have lived in the 6th century, and to have maintained a stubborn contest against Cerdic, but the Old English Chronicle is suspiciously silent as to his warfare and as to his existence. Indeed, the Welsh bards of the earliest period do not assert that he was a contemporary, and it is more than doubtful whether he is an historic personage. It is worthy of remark that the fame of Arthur is widely spread; he is claimed alike as a prince in Brittany, Cornwall, Wales, Cumberland, and the lowlands of Scotland; that is to say, his fame is continuous with the Brythonic race, and does not extend to the Goidels or Gaels. As is now well known, Great Britain was twice invaded by races of Celtic speech; the first wave was that of the Goidels, and after a lapse of some considerable time a second Celtic wave, that of the Brythons or Britons from the east, overran Britain, and drove the Gaels to west and north. Finn and Ossian belong to the mythic heroic cycle of the Gaels, and Arthur and Merlin to that of the Britons. These several shadowy forms are probably deities shorn of their divinity and given historic attributes and position, much as, among the Norsemen, Odin, when he ceased to be regarded as the All-father or God, came to be reckoned as an ancestor of the kings.

In the lays of the Welsh bards, supposed to be as early as the 6th and 7th centuries (although no MS. is extant of older date than the 12th century), Arthur and his brave companions are celebrated, but modestly and without marvels. It is possible that there may have existed in the 6th century a prince bearing the already well-known heroic name; and if so, about him the myths belonging to the remote ancestor or god have crystallised. Skene fought hard for the historicity. More recent investigators have held that Artorius was Roman or of Romanic stock, and that his succession to the British sovereignty marks the beginning of Britain as a state. Gildas, who could have provided a contemporary account of Arthur, is silent about him: possibly he became famous in war against the Saxons after the *De Excidio* was written. The Arthuriana in Nennius (in the *Historia Brittonum*) occur in the part which is the work of a redactor in 810-25. Attempts to fix the chronology and facts from the confusions and miraculous elements in Nennius and Geoffrey of Monmouth are untrustworthy; but the student of Nennius gathers that the historical Arthur is not lost in Geoffrey's work. The Arthur who fought against the Saxons was aided by the kings of Britain, but was himself 'the leader in the wars.' Some of them, at any rate, were fought in the neighbourhood of Antonine's Wall. Now the Arthur of popular literature is the Arthur of romance. Historical features are doubtless his friendliness to the Church, to its faith, its order, and its ascetic institutions—all in direct contrast to his contemporary Maelgwn Gwynedd, whom Gildas denounces so severely. In the so-called Armorica collections of Walter, Arch-

deacon of Oxford (latter part of 11th century), from which Geoffrey of Monmouth (q.v.) professes to translate, the marvellous and supernatural elements largely prevail. Here for the first time does the magician Merlin come into association with Arthur. According to Geoffrey, Arthur's father, Uther, conceiving a passion for Igraine, wife of Gorlois, Duke of Cornwall, is changed by Merlin into the likeness of Gorlois, and Arthur is the result. After his father's death Arthur becomes paramount leader of the Britons, and makes victorious expeditions to Scotland, Ireland, Denmark, Norway, and also to France, where he defeats a great Roman army. During his absence his nephew Modred revolts, and seduces Arthur's wife, Gweniver (Gwenhwywar). Arthur, returning, falls in a battle with his nephew, and is carried to the Isle of Avalon (q.v.) to be cured of his wounds. Geoffrey's work apparently gave birth to a multitude of fictions which came to be considered as quasi-historical traditions. From these, exaggerated by each succeeding age, and recast by each narrator, sprang the famous metrical romances of the 12th and 13th centuries, first in French and afterwards in English, from which modern notions of Arthur are derived. In these his habitual residence is at Caerleon, on the Usk, in Wales, where, with his beautiful wife Guinevere, he lives in splendid state, surrounded by hundreds of knights and beautiful ladies, who serve as patterns of valour, breeding, and grace to all the world. Twelve knights, the bravest of the throng, form the centre of this retinue, and sit with the king at a round table, the 'Knights of the Round Table.' From his court knights go forth to all countries in search of adventure—to protect women, chastise oppressors, liberate the enchanted, enchain giants and malicious dwarfs, is their knightly mission.

A Welsh collection of stories called the *Mabwgonion*, of the 14th and 15th centuries, and translated into English by Lady Charlotte Guest in 1849, gives further Arthurian legends. Some of the stories 'have the character of chivalric romances,' and are therefore probably of French origin; while others 'bear the impress of a far higher antiquity, both as regards the manners they depict and the style of language in which they are composed.' These latter rarely mention Arthur, but the former belong, as Skene puts it, to the 'full-blown Arthurian romance.' Chrétien de Troyes (q.v.), in the latter part of the 12th century, made the Arthur legend the subject for his *Romans* and *Contes*, as well as for two epics on Tristan; the Holy Grail, Peredur, &c. belonging to the same cycle. Early in the same century Arthurian metrical romance became known in Germany, and there assumed a more animated and artistic form in the *Parzival* of Wolfram of Eschenbach, *Tristan and Isolde* of Gottfried of Strasburg, *Erec and Iwein* of Hartmann, and *Wigalois* of Wirth. The most renowned of the heroes of the Arthurian school are Peredur (Parzival or Perceval), Tristan or Tristram, Iwein, Erec, Gawain, Wigalois, Wigamur, Gauvain, and Lancelot. From France the Arthurian romance spread also to Spain, Provence, Italy, the Netherlands, and Iceland, and was again retransplanted into England, and given permanent literary form in Sir Thomas Malory's prose.

The name of King Arthur was given during the middle ages to many places and monuments supposed to have been in some way associated with his exploits, such as 'Arthur's Seat' near Edinburgh, 'Arthur's Oven' on the Carron near Falkirk, &c. What was called the sepulchre of his queen was shown at Meigle, in Strathmore, in the 16th century. Near Boscastle, in Cornwall, is Pentargain, a headland called after him 'Arthur's Head.' Other localities take his name

in Brittany. In the middle ages in Germany, Arthur's Courts were buildings in which the paticians assembled. Milton was meditating an Athurian epic in 1639; and interest in the legends about King Arthur and his knights was revived by Tennyson and Wagner.

For the Arthurian Romances, see ROMANCES, GRAIL, MALORY, MAP (WALTER), MERLIN, TENNYSON, TRISTREM, &c.; Gaston Paris, *Histoire Littéraire de la France*, books by Sir John Rhys and Miss Weston; the standard editions of Nennius, Wace, Layamon, Chrétien de Troyes, &c.; Sommer, *The Vulgate Version of the Arthurian Romances* (1908-16).

Arthur, PRINCE, the posthumous son of Geoffrey (Henry II.'s fourth son) by Constance, Duchess of Brittany, was born in 1187. On Richard's death in 1199, Arthur, by the law of primogeniture, should have succeeded to the English crown; and the French king, Philip II., upheld his claims, until John (q.v.) bought him over to a disgraceful treaty. Arthur soon after fell into his uncle's hands, and was imprisoned, first at Falaise, afterwards at Rouen, where, on 3d April 1203, he is supposed to have perished, either by assassination or by drowning in an attempt to escape. The story of John's orders to Hubert to put out his eyes was current as early as 1228, and is treated in a celebrated scene of Shakespeare's *King John*.

Arthur, CHESTER ALAN, twenty-first president of the United States, was born at Fairfield, in Franklin County, Vermont, on the 5th October 1830. His father was the Rev. W. Arthur, D.D., a Baptist minister, and a native of the north of Ireland. He distinguished himself as a student at Union College, New York, and devoting himself to law studies, was admitted to the bar in 1853. After having practised for some years, he was made a judge-advocate; at the outbreak of the great civil war he held the post of Inspector-general, and during the war was Quartermaster-general for the New York forces. He subsequently returned to law practice, but in 1871-78 was Collector of Customs at the port of New York. He was a leader of the Republican party in the State, and though belonging to the section of the Republicans opposed to Garfield on civil service reform, was made vice-president of the United States in 1881. Garfield's death in September 1881 called the vice-president to the supreme magistracy. Arthur held the office till 1885. During his term a bill dealing with the Mormon question was passed, and one with the Chinese question, as also a tariff bill with Protectionist bearings. He died 18th November 1886.

Arthur, SIR GEORGE, lieutenant-general, was born near Plymouth in 1784. As superintendent in charge of British Honduras, for eight years he ruled with strictness and energy, while treating the negro slave population with much humanity. In Tasmania, where he was lieutenant-governor from 1824 to 1836, his rule was even more despotic; but despotism was needed, for the colony, up to that time a neglected appendage of New South Wales, was overrun with bushrangers who had escaped from the convict settlements, and whose treatment of the natives kept them also in constant turmoil. By establishing at Port Arthur a prison-settlement from which escape was very difficult, and by arranging with friends of the natives (after one attempt at forcible concentration which was a fiasco) to collect them on a group of islands in Bass Strait, Arthur restored peace, and aided, though he did not encourage, free settlement. During his rule the population of the island trebled, and its trade increased 1200 per cent. Afterwards, as lieutenant-governor of Upper Canada (1837-41), he was successful in coping with discontent. Lieutenant-governor of Bombay (1842-46), he was

energetic in establishing British power in Sind, and put down a rising in Kolapur. Appointed provisional governor-general, he had to leave India because of ill-health. He died in 1854.

Arthur's Seat, a well-known lion-shaped hill immediately east of Edinburgh, and within the burgh boundary, rising to a height of 822 feet above sea-level. The ascent is easy, and the prospect from the top unrivalled. Arthur's Seat is supposed to derive its name from the British king. Like most of the hills in and around Edinburgh, it consists of hard, resistant igneous rocks; it was one of the many loci of volcanic activity in the midland valley of Scotland in Carboniferous times. The lava-form rocks are basalts, which, with their associated 'ashes,' are best developed in the *Whinny Hill*. The oldest flow forms the *Long Row*. Between it and the hill intervenes the *Dry Dam* eroded in a series of soft tuffs. Two chief centres of eruption may be recognised. The older, known as the *Lion's Head* vent, includes the basalt of the Lion's Head; the younger and more extensive takes its name from the *Lion's Haunch*. The junction between the two is well seen in the '*Gutted Haddie*,' where the agglomerate of the younger vent is seen to contain an old scree made up of fragments of the Lion's Head basalt. *Samson's Ribs* and *Dunsapie Hill* consist of intrusive basalts which have risen along the margin of the Lion's Haunch neck. The *Salisbury Craigs* form an independent intrusion, and on the slope between the Craigs and the Hunter's Bog occurs a third and smaller neck. See *Description of Arthur's Seat Volcano*, by B. N. Peach.

Artichoke (*Cynara Scolymus*), a thistle-like perennial plant belonging to the tubuliflorous group of composites, now growing wild in the south of Europe, but probably a native of Asia. The radical leaves are 3 to 4 feet long, somewhat spiny, pinnatifid, or undivided. The stem is 2 or 3 feet high, branched, with large heads of violet-coloured (sometimes white) thistle-like flowers at the summits of the branches. The plant has been long cultivated for the sake of the delicate succulent receptacle or broadened axis of the flower-head, taken before the flower expands, which is boiled and eaten with melted butter, or sometimes eaten raw with salt and pepper. The part used is the same which is called the *cheese* in thistles by children, and is sometimes eaten by them. The tender central leaf-stalk is also occasionally used

Artichoke.

in the same way as that of the Cardoon. Several varieties are in cultivation, differing in the more or less spiny leaves, and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about 4 feet asunder,

and 2 feet apart in the row. The artichoke bed continues productive for several years. Sea-weed is an excellent manure.—The Cardoon (q.v.) belongs to the same genus.—The Jerusalem Artichoke (q.v.) is a totally different plant, being a kind of sunflower (*Helianthus tuberosus*).

Articles of Association. See COMPANY.

Articles of War, ordinances for the government of troops, seamen, and camp-followers, by punishing, as crimes, acts or omissions which, in civil life, would be mere breaches of contract—e.g. desertion or disobedience of orders. *Military Articles of War* were, prior to the passing of the first Mutiny Act (q.v.) in 1689, the only ordinances for regulating discipline amongst the troops raised, from time to time, for each campaign. They were issued by the crown or by the commander-in-chief, in pursuance of authority conferred by the crown, for each campaign, and ceased to operate on its conclusion. This prerogative power, dating from the Conquest, was superseded in 1803 by a corresponding statutory power, expressed in section 69 of the Army Act of 1881, but not likely to be used. The earliest complete code, dated 1385, is the 'Statutes, Ordinances, and Customs' of Richard II. Articles of War were then issued by Henry V., Henry VII., and during the great Rebellion by both sides, in almost identical language; those of Lord Essex were published under an ordinance of the Lords and Commons. Charles II. and James II. also issued Articles of War. The former, dated 1672, formed the groundwork of those issued in 1878, which were consolidated with the Mutiny Act in the Army Discipline and Regulation Act of 1879, now replaced by the Army Act of 1881 (see the article ARMY); but the earlier Articles were of excessive severity—death or loss of limb for almost every crime.—The United States Articles of War are published in the annual Army Regulations, and cover generally the same ground as those of England. Sentences of death by courts-martial, as in the United Kingdom, must be concurred in by at least two-thirds of the members, and, with few exceptions, must be confirmed, before execution, by the president of the United States.

Naval Articles of War are similar in every respect to those for the army, and, like them, have been incorporated in a Naval Discipline Act, of which they form the first section. The power of the Admiralty to make Articles of War for the government of the Marines is recognised in section 179 of the Army Act, under which this body is disciplined when not borne on the books of a man-of-war in commission.—In the United States, marines are subject to the regulations for the army or navy, according as they happen to be engaged with either branch of the service; the Naval Articles being, however, essentially the same as those governing the army.

Indian Articles of War are a distinct and special body of regulations, and apply only to officers, soldiers, and camp-followers who are natives of India.

Articles, The Six, were imposed by act of parliament in 1539, when, Henry VIII. being displeased with some of the bishops most favourable to the Reformation, their opponents for a time regained the ascendancy. These articles asserted the doctrine of transubstantiation, declared communion in both kinds not to be necessary, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. The act imposing them was popularly called 'the six-stringed whip'. Severe penalties were appointed for writing or speaking against them, and for

abstaining from confession or the sacrament at the accustomed times, for priests failing to put away their wives, and for persons writing or speaking against the doctrine of transubstantiation. Archbishop Cranmer vainly opposed the act in the House of Lords: the king was resolute to have it passed. Its severity was mitigated by a subsequent act of his reign (1544), and although it continued substantially unrepealed, it was transgressed with impunity even by ecclesiastical dignitaries.

Articles, The Thirty-nine, of the Church of England, are the articles of religion which were agreed upon by the archbishops and bishops of both provinces and the whole clergy in the convocation held at London in the 4th year of Elizabeth, 1562, under Archbishop Parker. To have a clear view of the history of these important articles, we must go back to the promulgation of the original ones, forty-two in number, in the reign of Edward VI. The council appointed by the will of Henry VIII. to conduct the government during the king's minority, was for the most part favourably disposed towards the Reformed opinions, and the management of church affairs devolved almost entirely upon Archbishop Crammer. In the year 1549, an act of parliament was passed, empowering the king to appoint a commission of 32 persons, to make ecclesiastical laws. Under this act, a commission of 8 bishops, 8 divines, 8 civilians, and 8 lawyers (amongst whom were Crammer, Ridley, Hooper, Coverdale, Scory, Peter Martyr, and Justice Hales), was appointed in 1551, and one of its first acts was to draw up a code of articles of faith. These were forty-two in number, and were set forth by the king's authority in 1553. Strype makes it appear that these forty-two articles were agreed upon in the convocation that was sitting in 1552, but his assertion has been much questioned. Against Strype may be cited not only Fuller, but also Burnet, Lamb, and Palmer. But perhaps the best authority on the subject, Archdeacon Hardwick, in his *History of the Articles of Religion* (1859), makes it appear highly probable that Strype's view was correct. To these articles was prefixed the Catechism, and there is no doubt that Cranmer had the principal hand in their composition; for he owned before Queen Mary's commission that they were his doing. But immediately after their publication, Edward died, and one of the first acts of the convocation summoned with the parliament in the first year of Queen Mary, was to declare that these forty-two articles had not been set forth by the agreement of that House, and that they did not agree thereto. In 1558 Elizabeth succeeded her sister. In 1559 Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled up. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the Reformed Church. Parker applied himself to this work, and, for the purpose, revised the forty-two articles of King Edward, rejecting four of them entirely, and introducing four new ones—viz. the 5th, 12th, 29th, and 30th, as they now stand, and altering more or less seventeen others. This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of King Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of King Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to thirty-nine. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to

thirty-eight. From these thirty-eight there was a further omission—viz. of the first half of the 20th article, which declares that 'the church hath power to decree rites and ceremonies, and hath authority in controversies of faith.' As all the records of convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571 the articles once more underwent revision, Archbishop Parker and Bishop Jewel making a few trifling alterations, and the 29th being restored. The convocation which was then sitting ratified them both in Latin and English, and an act of parliament was passed in that year compelling the clergy to subscribe 'such of them as only concern the confession of the true Christian faith, and the doctrine of the Sacraments.' There still, however, remained some difficulty as to which was the authorised copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the thirty-nine articles as they now stand. 'His Majesty's Declaration,' which precedes them, and directs that they shall be interpreted 'in their literal and grammatical sense,' was prefixed by Charles I. in 1628.

It may be interesting to know from what other sources the thirty-nine articles are derived. Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording, with the Confession of Augsburg. The 9th and 16th are clearly due to the same source. Some of them, as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII., and annotated by the king's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it only existed in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melancthon.

The thirty-nine articles have been described as 'containing a whole body of divinity.' This can hardly be maintained. They contain, however, what the Church of England holds to be a fair scriptural account of the leading doctrines of Christianity, together with a condemnation of what she considers to be the principal errors of the Church of Rome and of certain Protestant sects. As far as they go (and there are many things unnoticed by them) they are a legal definition of the doctrines of the Church of England; though it is to the *Book of Common Prayer* that members of that communion look for the genuine expression of her faith. They were adopted by the convocation of the Irish Church in 1635, and by the Scottish Episcopal Church at the close of the 18th century. Corpus Christi College, Cambridge, contains the only copies of the Articles in manuscript or print that are of any authority. Amongst them are the Latin manuscript of the Articles of 1562, and the English manuscript of the Articles of 1571, each with the signatures of the archbishops and bishops who subscribed them.

See Hardwick's history of the Articles already cited. Amongst the commentaries upon them are those by Bishop Burnet (1669); Bishop Beveridge (1716); Bishop Forbes of Brechin (2d ed. 1871); and that most com-
tenanced by Anglican authorities, the exposition by Dr Harold Browne, Bishop of Winchester (Lond. 12th ed. 1882). *Tract XC.*, by Cardinal Newman, illustrated the 'elasticity' of the Articles. See also the **ARTICLES CREEDS** and **CONFESSIONS**.

Articula'ta or **ARTICULATED ANIMALS**, one of the great primary divisions of the Animal Kingdom, according to the system of Cuvier (see **ZOOLOGY**). It included those animals of which the body is divided into a number of distinct

joints—viz. the higher worms or Annelids, and also the Insects, Crustaceans, Arachnids, and Myriapods. The four latter groups were separated from the Annelida (q.v., and see also **WORMS**) by Von Siebold, on account of their possession of hollow jointed limbs, into a separate sub-kingdom, **Arthropoda** (q.v.).

Articulation. See **JOINTS**.

Artificial. See **DENTISTRY**, **RESPIRATION**, **SILK** (**ARTIFICIAL**), **STONES** (**PRECIOUS**), **PEARLS**, &c.

Artificial Limbs are mechanical contrivances adapted to reproduce the form, and as far as may be, the function of a lost or absent member. They have, in one form or other, been in use from very early times. Herodotus mentions the case of a prisoner who amputated his own foot to escape from his shackles, and, escaping to his friends, was provided with a wooden substitute. The brave M. Sergius, great-grandfather of Catiline, was consul in the year 167 B.C. He lost his right hand in his second campaign; and received twenty-three wounds, so that neither his remaining hand nor his feet were fully serviceable. Notwithstanding this, he fought in four battles with his left hand only; afterwards he made himself an iron hand, and fighting with it fastened on, was instrumental in raising the siege of Cremona, in protecting Placentia, and in storming twelve of the enemy's camps in Gaul, during the second Punic war (Pliny, *Hist. Nat.* 28, 104–106). In 1885 a remarkable specimen was discovered in a tomb at Capua along with other relics dating from 300 B.C.; it is thus described in the catalogue of the London Royal College of Surgeons, where the specimen is preserved: 'Roman Artificial Leg.—The artificial limb accurately represents the form of the leg. It is made with pieces of thin bronze fastened by bronze nails to a wooden core. Two iron bars, having holes at their free ends, are attached to the upper extremity of the bronze. A quadrilateral piece of iron, found near the position of the foot, is thought to have given strength to it. There was no trace of the foot, and the wooden core had nearly all crumbled away. The skeleton had its waist surrounded by a belt of sheet bronze, edged with small rivets, probably used to fasten a leather lining.' The upper third of the leg was hollow, while the lower two-thirds were filled with wood.

The celebrated artificial hand of the German knight, Götz von Berlichingen—'Götz of the Iron Hand'—was invented about 1504 by a mechanic of Nuremberg. It weighed three pounds, and was so constructed as to grasp a sword or lance. In the twelfth chapter of Ambroise Paré's *Œuvres de Chirurgie*, as translated by Thomas Johnson in 1605, it is described 'by what means arms, legs, and hands may be made by art, and placed instead of the natural arms, legs, and hands that are cut off or lost.' No improvements worthy of record were made from the time of Ambroise Paré till the beginning of the last century, when Baillif of Berlin constructed a hand which did not exceed a pound in weight, and in which the fingers, without the aid of the natural hand, not only exercised the movements of flexion and extension, but could be closed upon and retain light objects, such as a hat, and even a pen. Recent years have seen great advances in the adaptation of these mechanical contrivances to varied requirements. The first desideratum in an artificial limb is lightness. This applies equally to both upper and lower extremities. In other respects, however, important differences exist between what is desirable in an artificial arm and what in an artificial leg. In the former, *mobility*, to the extreme limit

compatible with control over its movements, is wished for; in the latter, *stability* is chiefly thought of. The artificial arm is destined to reproduce as far as possible the prehensile powers of the lost upper extremity; the artificial leg, the weight-supporting function of the natural lower limb. In both, the mechanical appliance must fit accurately and grasp firmly the stump of the natural limb; and this without exerting injurious pressure or causing discomfort at any point.

Arms.—The utility of an artificial arm depends much on the nature of the stump. A stump above the elbow is most suitable when it tapers gradually to its lower end, and terminates in a rounded surface. When an arm is removed at the shoulder-joint, and there is no stump, an artificial arm can still be fixed in its proper place by means of a corset. In amputation below the elbow-joint, the best stump is one formed by amputation at the wrist. The simplest form of artificial arm after amputation above the elbow, consists of a leathern sheath accurately fitted to the upper part of the stump. The lower end of the sheath is furnished with a wooden block and metal screw-plate, to which can be attached a fork for holding meat, a knife for cutting food, or a hook for carrying a weight. The arm should be so carried as to represent the position of the natural arm when at rest. It is retained in its position by shoulder and breast straps, and forms a light, useful, and inexpensive substitute for the lost member. More complicated, and therefore more expensive pieces of apparatus are made, in which motion is given to the fingers, a lateral action of the thumb is obtained, the wrist-movements are partially imitated, and a degree of natural softness given to the hand by a covering of gutta-percha and india-rubber. Nothing tended so much to the development of artificial arms and hands as an accident which happened about three-quarters of a century ago to the celebrated French tenor, Roger, who lost his right arm above the elbow. It was necessary, for his future appearance on the stage, that he should have an artificial limb, which would serve the purposes of histrionic action, and permit him to grasp a sword and draw it from its scabbard. Such a contrivance was invented in 1845 by Petersen, a Prussian mechanic, and the French Academy of Sciences commissioned M.M. Gambey, Rayer, Vélpeau, and Magendie to report upon it. The apparatus, which weighed less than 18 ounces, was tested upon a soldier who had lost both arms. By its aid he was enabled to pick up a pen, take hold of a leaf of paper, &c. Petersen's conceptions were improved by Messrs Charrière, the celebrated surgical mechanics of Paris, aided by Huguier, the well-known surgeon. An excellent artificial hand was invented by Heather Bigg, in which voluntary and variable movement is conferred on the thumb by a closed hydraulic apparatus. By compressing an india-rubber ball placed under the armpit, a piston is worked that can open or close the grasp of the thumb, with gentle or with forcible pressure as required. This added automatic mobility was a great advance in the construction of such appliances. (See H. Bigg, *Artificial Limbs and Amputations*, 1885).

Fig. 1.

The Beaufort arm (fig. 1) possesses a similar 'instinctive' power of movement. It consists of a wooden hand attached to a leathern socket that firmly fits the

stump. The fingers are half-closed parallel to one another, the first two finger-tips opposing that of the movable thumb. The thumb is pivoted on a pin concealed in the ball of the thumb; it is firmly pressed against the finger-tips by a strong india-rubber band similarly concealed. A piece of whipcord is attached to the back of the thumb, whence it runs upwards to the shoulder of the wearer, and across his back to the opposite shoulder, around which it is fastened by a tape loop. By drawing upon and relaxing the whipcord, the grasp of the thumb is alternately opened and closed; and these movements can be attained by slight movements of the shoulders, or by advancing and retracting the artificial arm. This arm was adopted by the French government for distribution to soldiers maimed in the Franco-German war of 1870-71. It is a remarkably efficient appliance, and has the advantage of cheapness, so that it is within the reach of all classes.

Legs.—The object in view here is to support weight, and to supply movement useful in progression. Weight can be borne in three ways in an artificial leg: (1) On the end of the stump; (2) by the contact-friction between the surface of the limb and a tightly fitting sheath; and (3) on the tuberosity of the ischium or 'sitting bone.'

The simplest artificial leg is the 'bucket' leg (fig. 2), consisting of a hollow wooden or leathern sheath, A, fitting accurately to the contour of the stump, and having a 'peg,' B, firmly attached to its lower end. The weight is here chiefly borne by the 'sitting bone,' which reposes on the smooth brim of the 'bucket.' The end of the stump should not quite reach the floor of the 'bucket,' hence it takes no part in supporting the weight of the body, which might give rise to pain in the stump. This appliance is suited only for amputation through the thigh. Its great defects are the absence of bending at the knee, and the absence of a foot, which makes it useless on soft ground.

Fig. 2.

Of the more complicated forms of artificial leg three are especially popular. The first of these is of English origin, and owing to its having been adopted by the Marquis of Anglesey, is known as the *Anglesey leg*; it is fully described in Gray's work on *Artificial Limbs*. The second is that invented by an American named Palmer, and called the *Palmer leg*. From its lightness and the greater ease of walking with it, it soon superseded the Anglesey leg in America. In the third, also invented in America, and known as *Dr Bly's leg*, the principal faults of the two other legs have been completely overcome. The advantages of this leg are thus summed up by Mr Bigg: (1) Adaptation to all amputations either above or below the knee. (2) Rotation and lateral action of the ankle-joint. (3) Power on the part of the patient to walk with ease on any surface, however irregular, as, owing to the motion of the ankle-joint, the sole of the foot readily accommodates itself to the unevenness of the ground. (4) The ankle-joint is rendered perfectly indestructible by ordinary wear, owing to its centre being composed of a glass ball resting in a cup of vulcanite. (5) The action of the ankle-joint is created by five elastic tendons, placed to accord with the position

assigned to them in a natural leg. These tendons are capable of being rendered tight or loose in a few seconds, so that the wearer of the leg has the power of adjusting with precision the exact degree of tension from which he finds the greatest comfort in walking. (6) There is a self-acting spring in the knee-joint, urging the leg forward in walking, and imparting automatic motion. (7) The whole is covered by a flesh-coloured enamel, which can be washed with soap and water. (8) At the knee-joint there is a mechanical arrangement representing the crucial ligaments, and affording natural action to that articulation by which all shock to the stump in walking is avoided. Hermann's artificial limb is still more highly approved by many, as affording more support when the knee is bent. See Max Schede's work on Amputation, and the *System of Surgery* by Holmes and Hulke (3d ed. 1883).

The Beaufort leg (fig. 3), invented by the Count de Beaufort in 1851, and improved subsequently,

Fig. 3.

has three great recommendations: it lengthens the stride that can be safely taken, it reproduces the natural gait, and it is remarkably cheap. Baron Larrey, the celebrated French surgeon, reported on this invention to the Academy of Medicine, that 'it consists of a piece of ash-wood, which, like the peg, is attached to the ordinary wooden leg. It replaces the metal disc of the peg, and is shaped somewhat like a foot, but shorter in length. The plantar surface is covered with a leathern sole, garnished with cork at the heel. It is curved in form, the curve being such as to give the limb continuous lines of bearing on the ground while the body moves forward, save that the curve is not so perfectly uniform as to involve any danger of slipping.' He shows how the curved sole is instrumental in increasing stability, in lengthening the pace, and in giving it a natural character. In 1865 this new form of foot was adapted to a new leg-case, with lateral supports of ash-wood, and a joint corresponding to the knee, applicable to cases of amputation of all sorts. The Great War led to great improvements in artificial limbs. For artificial eyes, noses, palates, teeth, see EYE, RHINOPLASTIC OPERATIONS, PALATE, DENTISTRY, TEETH.

Artillery originally meant any projectile, weapon, or engine of war, even bows and arrows and slings; now it means either cannon of any description or the soldiers who manage the cannon. It is here used in the latter sense; the description of various kinds of ordnance will be found either under CANNON or under their special names. *Artillery Park* is the name given to an assemblage of wagons of ammunition and appliances, which form a reserve for an army in the field or for an army undertaking a siege.

Artillery Corps.—The introduction of field-guns necessitated the formation of a body of men set apart to study the force and action of gunpowder, the flight and range of projectiles, the weight and strength of cannon, and the manœuvring of heavy masses of field artillery; and after the great wars

in the beginning of the 19th century artillery had become the third great branch of military service.

Artillery is divided into two great classes, field and garrison or siege. The former is divided into *Batteries* and *Brigades* (q.v.) as tactical units, and, besides the highly trained horse, field, and mountain, there are field howitzer batteries and brigades, and 'heavy' (60-pounder) batteries. Marine artillerymen belong to the navy, and work the heavy ships' guns. They are organised like infantry, in companies.

The Royal Regiment of Artillery is the collective name for the whole of the artillery of the British army. Formed first in 1715, and granted precedence next to the cavalry and above the engineers and infantry, it has received constant additions, comprising *Horse, Field, and Garrison Artillery*. The personnel of the first two are interchangeable. The regular mountain artillery, which exists only in India, has 8 batteries of British and 10 of Indians, and is a part of the garrison artillery. The Territorial Force has 3 mountain batteries.

In action, the horse artillery, having all the men mounted, can manœuvre with cavalry; the field artillery, carrying the gunners on the guns and wagons, and being armed with a heavier weapon, cannot move at such a rapid pace except for short distances. The garrison artillery furnishes the heavy (60-pounder) batteries, whose guns and wagons are readily mobile on good roads, but need bullocks or elephants in difficult country; but its chief duty is to work the heavy guns of forts, siege batteries, and coast defenses.

Regular Artillery.—Before the Great War there were 28 batteries of horse artillery, of which about half were usually stationed at home. The field artillery numbered 150, batteries, of which a number were kept in peace-time on a four-gun basis for economy, while a full battery of horse or field artillery has six guns. About a third of the field batteries were in India. The heavy (60-pounder) battery, of which there were 12, has four guns. The garrison artillery is organised in companies, of which there were 100, about 30 being in India. They furnish officers and men for the heavy and medium siege brigades (see BRIGADE).

Garrison companies had each 5 officers and 129 rank and file. Horse and field artillery batteries have a major in command and 4 other officers, 9 sergeants, and 9 artificers. They have 178 and 175 rank and file respectively, of whom some are 'gunners' and some 'drivers,' with a detachment of signallers, range-takers, &c., and they have 220 and 180 horses respectively. Each battery has 12 ammunition-wagons in first line, and 6 in the ammunition column (see COLUMN). The horse artillery is armed with 13-pounder Q.F. guns, the field artillery with 18-pounder Q.F. guns (see CANNON). A mountain battery has 6 10-pounder jointed guns in war (2 in peace time), 265 draught and pack animals (mules), and a personnel of 5 officers and 112 rank and file. The gun and carriage are taken to pieces for transport. All artillery fires with smokeless powder.

Men of the horse artillery enlisted for six years with the colours, and six years in the army reserve (see ARMY); of the field artillery, for six or three years with the colours, six or nine in the army reserve; of the garrison artillery, for eight years with the colours, four years in the army reserve.

The army estimates for 1911-12 showed the following numbers, including India:

ROYAL HORSE AND ROYAL FIELD ARTILLERY (REGULARS).	
Commissioned officers...	1,108
Other ranks.....	28,929
Horses.....	23,967

ROYAL GARRISON ARTILLERY (REGULARS).	
Commissioned officers.....	805
Other ranks.....	17,773
Horses and mules.....	2,493

Besides these, there is a considerable personnel of all ranks employed extra-regimentally, a number that would raise the total to nearly 50,000. This is approximately the peace establishment. In the Great War the *personnel* rose to more than ten times this figure, the chief increase being in the garrison, which title is becoming a misnomer. The army reserve and the special reserve (see ARMY) provide a large addition on mobilisation for war, when also a very large addition of horses is obtained by the method of registering 'civilian horses' in peace-time, and by 'boarding out' trained horses.

There is a Royal Field Reserve Artillery, consisting of 31 batteries, and there are 2 batteries of Royal Garrison Reserve Artillery.

The Artillery of the Territorial Force.—The Honourable Artillery Company, the oldest existing volunteer corps of the county, has been incorporated into the Territorial Army. Together with the *Sergeants-at-arms*, the *Yeomen of the Guard*, and the *Gentlemen Pensioners*, it was established as far back as 1537, when Henry VIII. granted a patent creating the 'Fraternity or Guild of Artillery of Long-bows, Cross-bows, and Hand guns.' In 1638 the Corporation of the City of London presented to the company the Artillery Grounds, near Moorfields, for military exercises. Royal princes frequently enrolled themselves as members of the company, usually as 'captain-general.' In 1780, during the 'Lord George Gordon riots,' this company effectually protected the Bank of England; always ready if needed, it never engaged in actual warfare until it fought in South Africa, 1900-1902. Its members used to be elected by the ballot of a Court of Assistants, pay two guineas annual subscription and £5 entrance fee, and supply uniforms, but not arms and accoutrements. The company is the only volunteer body allowed to march through the streets of the City with bayonets fixed. See G. A. Raikes, *History of the Hon. Artillery Company* (2 vols. 1878-80).

The Territorial Force contains all the categories of artillery—viz. 11 batteries of horse, 55 brigades of field (see BRIGADE) armed with 18-pounders Q.F. (quick firer), 14 batteries heavy, 3 mountain, and 93 companies garrison for the defended ports and big guns in the field.

The Colonial Artillery.—The crown colonies and the overseas dominions have a considerable artillery force. Hong-kong and Singapore have 5 garrison companies, the West Indies 3, Sierra Leone 1, all administered by the War Office. The Colonial Office maintains 4 batteries in Nigeria. Canada kept in 1913 30 mounted batteries and 20 garrison companies. Australia, having organised universal service, has a large artillery force. The New Zealand Volunteers had (1913) 6 batteries and 9 garrison companies. The Union of South Africa has developed a strong artillery corps.

Artillery Schools.—The first school for artillery instruction was established by the Venetians in the beginning of the 16th century. Soon afterwards Charles V. established similar schools at Burgos and in Sicily. The French founded a school of practical artillery in 1675, and soon after a theoretical school at Douai. Saxony had an artillery school in 1766, but the other German states were more tardy in this direction. The officers' studies in such schools comprise mathematics, as much of physics and chemistry as is necessary, the theory and practice of ranging and indirect firing (see BATTERY), field and permanent fortification, tactics, &c. The practical exercises

include gun and howitzer drill, reconnoitring for and taking up fire positions, ranging, and indirect firing, siege operations, laboratory and manufacturing studies. All the Continental Powers, as well as the United States, Japan, and others, have such schools, situated at points where ample range is available, some on the seacoast and some inland. The self-governing dominions are instituting similar schools, which will resemble those of Great Britain. The British school of gunnery is at Shoeburyness, the SE. point of Essex, and thus at the mouth of the Thames, where there is a 10-mile range along the Maplin Sands. The field artillery school is transferred, from April till October, to the inland ranges at Okehampton, on Dartmoor, and at Bally in Scotland; and the garrison artillery school spends some time annually at Lydd, in Kent, where the destruction of obstacles by heavy guns is practised. The navy has its artillery school on Whale Island, in Portsmouth Harbour. India has no considerable artillery school.

The latest development in artillery is the provision of guns for dealing with aircraft, a matter in which all the great Powers are experimenting. The chief trouble is in ranging, for a miss does not, as in land and sea firing, show by a strike the extent and direction of the error. This can be met by the shell leaving a trail of smoke in its flight, but the high speed of aircraft imparts a serious difficulty. Practice, also, at this kind of shooting is evidently only to be had by towing a target behind an aeroplane or airship, which is neither easy nor satisfactory. The best condition for the gunner is when the aircraft is right above him; but, as the shell or its pieces must return to earth, the vicinity of the anti-aircraft battery would be an unpopular stance for friendly troops.

A *Royal Military Academy* was established at Woolwich in 1741 for the artillerists and engineers of the royal army. The East India Company sent their cadets to this academy from 1798 to 1810: but afterwards, until 1861, they maintained a separate establishment at Addiscombe. The students at the academy are admitted, by open competition for the most part, between the ages of seventeen and nineteen, and remain two years. The sons of military and naval officers are admitted on lower terms than those of other persons. A number of establishments of instructional or manufacturing character exist in connection with the artillery—at Woolwich, the Ordnance College (educational), ordnance factories and laboratory, inspection and experimental staff, Royal Artillery Committee; at Waltham Abbey, gunpowder factory; at Shoeburyness, experimental staff; and relations are preserved with ordnance manufacturers like Vickers and Armstrong.

Artiodactyla, 'even-toed' hoofed animals or Ungulates, in which the third and fourth digits form a symmetrical pair between which lies the median plane or axis of the foot. Ox, sheep, deer, and pig are familiar examples. The term is used in contrast to *Perissodactyla*, the 'odd-toed' Ungulates, including horse, tapir, rhinoceros, and many extinct types, in which the median plane or axis of the foot bisects the third digit (in the case of the horse the only fully formed digit). There are many other differences between the two sub-orders; thus *Artiodactyla* have two or four toes on the hind-foot, while *Perissodactyla* have one or three; *Artiodactyla* have nineteen dorso-lumbar vertebrae, while *Perissodactyla* have always more than twenty-two. The contrast broadly corresponds to the old divisions of cloven-hoofed and solid-hoofed respectively.

Artiodactyla made their appearance in the Eocene. They are represented in every part of the world except Australia and New Zealand,

and include seven or more families with living representatives, besides others entirely extinct. The sub-order may be divided into the non-ruminants and the ruminants or cud-chewers. The non-ruminants include the pigs, peccaries, and hippopotamuses. In the Old World pigs (*Suidæ*) digits III. and IV. reach the ground, II. and V. are much shorter; the skin bears numerous bristles and hairs; the molar teeth are tuberculated; there is a short mobile snout; the stomach is relatively simple, with a single diverticulum. In wild swine the number of young may be four to six, in domesticated races still more, and in this the *Suidæ* are contrasted with the other Ungulates. The New World peccaries are referred by many to a separate family, *Dicotylidæ*, for they are in several respects divergent. Thus on the hind-foot the fifth digit is practically absent, the stomach has two diverticula, and there are only two mammae. The Hippopotamidæ include two living species, herbivorous, unwieldy, semi-aquatic animals, with very thick skin and few hairs, with all the four digits reaching the ground, with large incisors and canines, and with a three-chambered stomach.

The ruminants include cattle, sheep, antelopes, prong-buck, giraffes, deer, chevrotains, and camels. The Camelidæ or Tylopoda are represented by two extant genera, the Old World *Camelus* (camel and dromedary) and the New World *Lama* (llama and alpaca). The Tragulidæ or Chevrotains are small hornless animals in two genera, survivors of an ancient family regarded by some as linking ruminants to the other Artiodactyla. The Cervidæ or deer are usually marked by solid deciduous antlers. In the reindeer both sexes have antlers; in all other living forms the antlers, if present, are confined to the males. They are absent in the musk-deer (*Moschus*) and in the water-deer (*Hydropotes*). The Giraffidæ include the well-known, long-legged, long-necked giraffes, with short, permanent, skin-covered horns in both sexes, and the rare Okapi (q.v.). The prong-buck (*Antilocapra*) of North America has horns of the antelope type, but the horny sheath is periodically shed; for this and some other reasons it is often referred to a separate family, *Antilocapridæ*. The remaining extant Artiodactyla are the Bovidæ—cattle, sheep, goats, chamois, and a huge number of antelopes. Horns, consisting of a bony core and an outer horny covering, occur in the males of Bovidæ, and very often in the females as well. The term *Pecora* or *Cotylophora* is often applied to the ruminants after the exclusion of camels and chevrotains. Most ruminants are without incisors in the upper jaw, the lower incisors and canines biting against a horny pad. All ruminants have half-moon-like ridges of enamel on the crown of the premolars and molars (selenodont). A typical ruminant stomach shows four chambers—the rumen or paunch, the reticulum or honeycomb, the psalterium or manyplies, and the abomasum or reed. The first three belong to the base of the gullet; only the fourth is true stomach. The hastily swallowed grass and the like passes into the rumen and reticulum; at the cud-chewer's leisure it is regurgitated to the mouth and thoroughly masticated. Descending again, it practically omits the first two chambers and passes along a groove, with approximated sides, into the psalterium, and thence into the abomasum, where gastric digestion begins.

See RUMINANTS, BOVIDÆ, DEER; also PIG, HIPPOPOTAMUS, ALPACA, ANTELOPE, BUFFALO, CAMEL, GIRAFFE, LLAMA, SHEEP, &c.

Artocarpaceæ, a natural order of archi-lamydeous dicotyledons, of which the Bread-fruit (*Artocarpus incisa*) is the most familiar example; it is usually included in the Moraceæ, or includes the Moraceæ, and is often grouped as a sub-order

of the great nettle family, *Urticaceæ*, but by Baillon under *Ulmaceæ*. The *Artocarpaceæ* proper are almost all tropical trees, and include many highly useful species, as well as some deleterious to man. The milky juice of some (*Castilloa*) yields India-rubber (q.v.); and that of a few species is so bland as to be used as a substitute for milk (see COW-TREE). The juice of others is, however, very poisonous, as that of *Antiaris toxicaria*, the poison usually called Upas (q.v.) by the Javanese. The fruits (see FIG, JACK) are wholesome; the importance of Bread-fruit (q.v.) in the South Sea Islands is well known; and the seeds of the Musanga of the Gold Coast of Africa, and of *Brosimum alicastrum* (Bread-nut) in the West Indies, are eaten as nuts. The fibrous bark of the Bread-fruit tree is made into cloth; its wood is used for building, its male catkins for tinder; its leaves serve as substitutes for table-cloths and wrapping-papers, and its milky juice for bird-lime. The bark of *Antiaris saccidora* is used in western India for making sacks, which are formed by cutting a branch of the dimensions of the sack wanted, and simply turning back and drawing off the bark after it has been soaked and beaten, the wood being sawn off so as to leave a little portion to form the bottom of the sack.

Artois, an old province in the north of France, bounded by Flanders and Picardy, and almost corresponding with the modern department of Pas-de-Calais. Its capital was Arras. Louis IX. in 1237 made Artois a county, and gave it to his brother Robert. Afterwards it passed into the hands of Flanders and Burgundy, but was ceded to France by treaties in 1659. Charles X., in his early life, and also after his abdication, was known by the title of Comte d'Artois.

Arts, or 'Liberal Arts,' a term technically applied to certain studies, came into use during the middle ages, and on the establishment of universities the term 'Faculty of Arts' denoted those who devoted themselves to Science and Philosophy, as distinguished from the faculty of Theology, and afterwards of Medicine and Law. The number of 'Arts' embraced in the full medieval course of learning was seven: Grammar, Dialectic, Rhetoric (constituting the *Trivium*), Music, Arithmetic, Geometry, and Astronomy (the *Quadrivium*). The terms Master and Doctor were originally applied synonymously to any person engaged in teaching. In process of time the one was restricted to the liberal arts; the other to Divinity, Law, and Medicine. See DEGREES, UNIVERSITY.

Artsibashev, MIKHAIL PETROVICH, Russian novelist and dramatist, a Tatar with Russian, French, Georgian, and Polish blood in his veins, and a great-grandson of Kosciusko, was born in 1878. His *Savin* (1909), *Breaking Point* (1915), and other erotic pessimistic stories have been translated—*The Millionaire* with autobiography (1915).

Art Unions, associations having for their object the promotion of an interest in the fine arts, and a more liberal patronage of them by the public. Though the origin of these unions seems to belong to the French, it was the Germans who fostered and developed them into the important aids to art they afterwards became. The Art Union of Munich was formed in 1823, and within ten years of that date nearly every town of any consequence in Germany had one. Many of the German associations also directed their attention to the formation and encouragement of permanent galleries of art and other kindred objects, that of Cologne greatly assisting in the completion of its celebrated cathedral.

The first union in Britain was established in Edinburgh in 1834, at which time the patronage of

the fine arts had reached such a low ebb that, excluding portraits, the amount expended in the purchase of pictures in the Scottish Academy's annual exhibition was sometimes as low as £35, and never more than £300. The success of the association was immediate, and to its founders the public are in no small degree indebted for the rapid progress that ensued. It acted after the example of the German unions in purchasing important works of art for the permanent National Gallery. Similar associations immediately followed in London and Dublin. These associations are nearly all constituted alike, and consist of any number of persons paying a certain sum towards a fund, which, after deducting necessary expenses, is mainly devoted to the purchase of works of art for distribution as prizes to the subscribers.

The distribution is effected on the lottery principle, but a diversity of practice exists in the method of expending the funds. Firstly, the method common on the Continent, and adopted in Edinburgh, consists in putting, year by year, the whole sum to be devoted to the purchase of works of art into the hands of a committee chosen for their supposed taste in such matters, and requesting them to purchase pictures and other works of art for distribution by lot to the subscribers. Secondly, the plan followed by the London Art Union is to distribute the money itself by lot, and to insist on the prize-holders expending their prizes in pictures, selected by themselves, from certain exhibitions. If the object of the associations is to cultivate a taste for higher art than exists in the general community for the time being, then the first method is doubtless the true one.

The weak point of art unions is the expense of management, which in some cases is a very high percentage of the total sum subscribed; and it may even be doubted whether, now that the patronage of art has grown to its present dimensions, they have not outlived their usefulness.

The difficulty of distinguishing between the lottery as part of the art union, and lotteries of an unquestionably illegal kind, led in 1846 to the passing of a special act for legalising *bona-fide* art unions, maintained solely for the encouragement of art. Unions, however, to be legal, must be incorporated by royal charter, or the instrument constituting the association and their rules be previously approved by the Privy-council.

Artvin, a town on the Charuch, 34 miles S. of Batum; pop. 8000.

Arru. See ARRU.

Aruba, an island of the Dutch West Indies; pop. 7300. See CURAÇAO.

Arum, a genus of spadicefloral monocotyledons, belonging to the natural order Araceæ or Aroidæ. This order is chiefly tropical, and comprises herbaceous plants, some of which are stemless; shrubby plants, some of which are arborescent; and plants which climb by aerial roots, clinging to the trees of tropical forests. The leaves are sheathing at the base, convolute in bud, usually with branching veins. The small degenerate flowers are crowded upon the elongated axis or *spadix*, which is generally inclosed by a large bract or *Spathe* (q.v.), frequently coloured or white: the male flowers are aggregated at the upper part of the spadix, and the female flowers towards its base. In some species, a stench like that of carrion is produced during flowering, as well as a remarkable degree of heat. Plants are of course slightly warmer than the air around them, the heat being produced by the breaking up and oxidation of their protoplasm, and by the true respiration, in short, which goes on in all living tissues (see ANIMAL HEAT); but flowers,

in general, are only 1° or 1½° warmer than the air, whereas the flowers of some of the Arums and nearly allied plants are sensibly warm to the touch, and that of *A. cordifolium* has been found to have a heat of 121° F., when that of the air was only 66° F.—The only British species is *A. maculatum*, Cuckoo-pint, Lords and Ladies, or Wake-Robin, abundant in England and most parts of Europe, growing chiefly in moist shady woods and under hedges. It has a tuberous perennial root; its leaves are all radical, on long stalks, strongly arrow-shaped, often spotted; the spathe greenish yellow, inclosing a rather short violet or brownish-red spadix. It produces scarlet berries, 1-2 seeded, about the size of peas, clustered upon the spadix. The root has a burning acrid taste, which, however, it loses in drying or boiling. In a fresh state, it is a drastic purgative, too violent for medicinal use; and, indeed, it, as well as the leaves, is an active poison; yet a nourishing farina is prepared from it, after the acrid juice has been removed. This farina is a pure starch, and is known in England by the name of Portland Sago or Portland Arrowroot. It was formerly prepared to a considerable extent in the Isle of Portland, where also the tubers (corms) themselves were eaten by the country-people. They lose great part of their acidity in drying, and were formerly used in medicine as a stimulant in impaired digestion, a diuretic in dropsies, and an expectorant in chest complaints. The plant is cultivated in India for food.—*A. indicum* is also cultivated in Bengal for its esculent stems and small pendulous tubers.—Acridity in the juice, and the presence of an abundant and nutritive store of starch, from which the acrid juice is easily separated, are characteristics of many plants of this order, particularly species of *Caladium* and *Colocasia*, much used for food in warm countries, under the names Cocco (q.v.), Taio (q.v.), &c.—*Amorphophallus campanulatus* (*A. campanulatus*), called Ol by the Bengalese, is cultivated in some parts of India for its corms, which form a very important article of food; yet in a fresh state it is so acrid that it is employed as an external stimulant. The peculiar acridity of the order is most remarkably displayed in *Dieffenbachia*, the Dumb Cane (q.v.).—Two large species of *Arisæma*, another genus very closely allied to Arum, were found by Sir J. Hooker to afford food to the inhabitants of the Sikkim Himalaya at an elevation of upwards of 10,000 feet. Their tuberous roots are bruised by means of wooden pestles, and thrown into small pits with water, until the commencement of acetous fermentation, when the acridity is mostly dissipated; but the process is so imperfect that cases of injury from the poisonous juice are frequent. The tubers of *Arisæma atrorubens*, a native of the United States, and there known as Dragon-root and Indian Turnip, yield a pure white starch like that of *A. maculatum*.—The Dragon-plant, *A. Dracunculius*, a native of the south of Europe, is sometimes seen in gardens in Britain, despite its carrion-like smell.—The so-called 'Lily of the Nile,' so commonly used as a decorative plant in this country on account of its white spathes and large leaves, is *Richardia* (*Calla*) *æthiopica*.

Arum maculatum: A, flower-stalk within bract or spathe, B, flower-stalk without spathe.

Arundel, an ancient municipal borough (till 1867 also parliamentary) of Sussex, on the navigable Arun, 5 miles from its mouth, and 10 miles E. of Chichester. Arundel Castle, the seat of the Fitzalans, Earls of Arundel, from 1243 to 1580, and since then of the Howards (q.v.), comprises a circular Norman keep, 100 feet high, and a modern Gothic edifice dating from 1791. It has stood three great sieges, in 1102, in 1139, and in 1644. The cruciform parish church (1387) has its choir cut off from the nave by a brick wall. The Duke of Norfolk's proprietary claims over this choir, called the Fitzalan chapel, but really a collegiate church, were vainly contested in 1879-80. The splendid Roman Catholic church (1873) was erected by the Duke of Norfolk at a cost of £150,000. Pop. 3000. See Tierny's *Arundel* (1834), and Freeman's *English Towns* (1883).

Arundel, THOMAS, Archbishop of Canterbury, was born in 1353, the third son of Robert Fitzalan, Earl of Arundel. In his twenty-first year he was raised from the archdeaconry of Taunton to the see of Ely; in 1388 he was translated to the archbishopric of York, and in 1396 to that of Canterbury. Banished by Richard II. (1397), he helped to seat Henry of Lancaster on the throne (1399); but he is chiefly remembered as a bitter opponent of the Lollards, two of whom were burned by him in 1401 and 1410. He died 19th February 1413.

Arundel Marbles, part of a collection of ancient sculptures, purchased in 1624 at Smyrna and elsewhere by Thomas Howard, Earl of Arundel (1586-1646), and presented in 1667 to the university of Oxford by his grandson, Henry Howard, afterwards Duke of Norfolk. Its gem is the 'Parian Chronicle,' consisting of fragments of a marble inscription, supposed to have been executed in the island of Paros about 263 B.C. In its perfect state this inscription contained a chronological table of the principal events in Grecian history from 1582 to 264 B.C. The chronicle of the last ninety years is lost, and the extant portion of the inscription is much corroded and defaced. The 'Arundel Society' (1848-97), for promoting the knowledge of art, commemorated the name of the Earl of Arundel; its facsimiles and photographic reproductions are famous.

Arundo. See REED.

Aruwimi is the name of an important tributary of the Congo, entering the latter from the north in 1° 10' N. lat., 23° 30' E. long. It was explored for 100 miles by Stanley in 1883, and by it Stanley advanced to the relief of Emin Pasha in 1887. For a time it was maintained by some that the Aruwimi was the lower course of Schweinfurth's Welle, now known to enter the Congo by the Mobangi far to the west. See CONGO, AFRICA.

Arvad (Gr. *Arados*), an ancient city of Phœnicia, occupying a small island barely a mile in circumference, 2 miles from the coast, near the mouth of the river Eleutherus. It is said to have been founded by the Sidonians, and was famed for the seafaring skill of its inhabitants.

Arval Brethren (*Fratres Arvales*), a college of twelve priests in ancient Rome, who yearly made offerings to the field Lares for the increase of the fruits of the field. Its institution was ascribed to Romulus, from which we may at least argue its extreme antiquity. Niebuhr suggested that it was originally connected with the Latin element of the Roman state, just as its sister college, that of the *Sodales Titii*, was confessedly instituted for the purpose of keeping up the specially Sabine religious rites. The office was held for life—its badge was a chaplet of ears of corn worn on the head with a white band. One account of the ceremonies at

their principal festival, that of three days in honour of Dea Dia, supposed to be Ceres, is preserved in an inscription written in the first year of the Emperor Elagabalus (218 A.D.). The same inscription contains a hymn, which appears to have been sung at the festival from the earliest times. Later inscriptions show that the college was still in existence about the middle of the fourth century.

Arve, a mountain stream rising in the Col de Balme, one of the Savoyan Alps, and flowing through the Vale of Chamouni into the canton of Geneva, below which town it joins the Rhone, after a course of 62 miles.

Arveyron, a small tributary of the Arve, in Savoy, is the outlet of the famous *Mer de Glace*, in the valley of Chamouni, from which it issues in a torrent through a beautiful grotto of ice, from 40 to 150 feet in height, known as the 'Ice-gates of the Arveyron.' Its course is short, and it joins the Arve on its right bank, some distance above Chamouni.

Arvic'ola. See VOLE.

Ar'yans and Aryan Languages. The name Aryan (less properly, Arian) has, since about 1845, been used to designate the ethnological division of mankind otherwise called Indo-European or Indo-Germanic. That division consists of two branches, geographically separated, an eastern and a western. The western branch comprehends most of the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, the Basques of the Pyrenees, and the Finns and Lapps; the eastern comprehends the inhabitants of Armenia, of Persia, of Afghanistan, and of Northern Hindustan. The evidence on which a family relation has been established among these nations is that of language. Between Sanskrit (the mother of the modern Hindu dialects of Hindustan), Zend (the language of the ancient Persians), Greek (which is yet the language of Greece), Latin (the language of the Romans, and the mother of the modern Romanic languages—i.e. Italian, French, Spanish, Portuguese, Rumanian), Celtic (once the language of great part of Europe, now confined to Wales and parts of France, Ireland, and Scotland), Gothic (which may be taken as the ancient type of the Teutonic or Germanic languages—including English and Scandinavian), and Slavonic (spoken in a variety of dialects all over the east of Europe and a great part of the south-east), the researches of philology within the 19th century established such affinities as can be accounted for only by supposing that the nations who originally spoke them had a common origin. No one of these nations, existing or historical, can claim to be the parent nation of which the others were colonies. The relation among the languages mentioned is that of sisters—daughters of one mother, which perished, as it were, in giving them birth. No monuments of this mother-language have been preserved, nor have we any history or even tradition of the nation that spoke it. That such a people existed and spoke such a tongue is an inference of comparative philology, the process of reasoning being analogous to that followed in the kindred science of geology. The geologist, interpreting the inscriptions written by the finger of Nature herself upon the rock-tablets of the earth's strata, carries us back myriads of ages before man appeared on the scene at all, and enables us to be present, as it were, at creation itself, and see one formation laid above another, and one plant or animal succeed another. Now languages are to the ethnologist what strata are in geology; dead languages have been well called his fossils and petrifications. By skilful interpretation of their indications, aided by the light of all other avail-

able monuments, he is able to spell out, with more or less probability, the ethnical records of the past, and thus obtain a glimpse here and there into the gray cloud that rests over the dawn of the ages.

When these linguistic monuments are consulted as to the primitive seat of the Aryan nations, they point to Central Asia, somewhere probably east of the Caspian, and north of the Hindu Kush and Paropamisian Mountains. There, at a period long anterior to all European history—while Europe was perhaps only a jungle, or, if inhabited at all, inhabited by tribes akin to the Finns, or perhaps to the American Indians—dwelt that mother-nation of which we have spoken. From this centre, in obedience to a law of movement which has continued to act through all history, successive migrations took place towards the north-west. The first swarm formed the Celts, who seem at one time to have occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic peoples. All these would seem to have made their way to their new settlements through Persia and Asia Minor, crossing into Europe by the Hellespont, and partly, perhaps, between the Caspian and the Black Sea. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a period subsequent to the last north-western migration, the remnant of the primitive stock would seem to have broken up; part poured southwards through the passes of the Himalaya and Hindu Kush into the Punjab, and became the dominant race in the valley of the Ganges; while the rest settled in Persia, and became the Medes and Persians of history.

It is from these eastern members that the whole family takes its name. In the most ancient Sanskrit writings (the Veda), the Hindus style themselves *Āryas*; and the name may be preserved in the classic *Arii*, a tribe of ancient Persia, and in the district *Ariana*. *Airya* is evidently an old Persian word, preserved in the modern native name of Persia, *Airan* or *Iran*. *Ārya*, in Sanskrit, signifies 'excellent,' 'honourable,' originally, 'lord of the soil,' from a root *ar* (Lat. *arare*, 'to plough'), distinguishing tillers (*earers*) of the earth from the nomadic Turanians. Some limit the word *Aryan* to the eastern section of the Indo-European stock.

Max Müller has drawn a picture of the Aryan family while yet one and undivided, in which the state of thought, language, religion, and civilisation is exhibited in a multitude of details. Where the same name for an object or notion is found used by the widely spread members of the family, it is justly inferred that that object or notion must have been familiar to them while yet resident together in the paternal home. It is in this way established, that among the primitive Aryans not only were the natural and primary family relations of father, mother, son, daughter, hallowed, but even the more conventional affinities of father-in-law, mother-in-law, sister-in-law; that to the organised family life there was superadded a state organisation with rulers or kings; that the ox and the cow constituted the chief riches and means of subsistence; and that houses and towns were built.

One general observation made by Max Müller is so interesting that we quote it entire. 'It should be observed,' he says, 'that most of the terms connected with chase and warfare differ in each of the Aryan dialects, while words connected with more peaceful occupations belong generally to the common heirloom of the Aryan language. The proper appreciation of this fact in its general bearing will show how a similar remark made by Niebuhr, with regard to Greek and Latin, requires a very different explanation

from that which that great scholar, from his more restricted point of view, was able to give it. It will show that all the Aryan nations had led a long life of peace before they separated, and that their language acquired individuality and nationality as each colony started in search of new homes—new generations forming new terms connected with the warlike and adventurous life of their onward migrations. Hence it is that not only Greek and Latin, but all Aryan languages, have their peaceful words in common; and hence it is that they all differ so strangely in their warlike expressions. Thus the domestic animals are generally known by the same name in England and in India, while the wild beasts have different names, even in Greek and Latin.'

In this mainly pastoral life, the more important of the primitive arts were known and exercised: fields were tilled; grain was raised and ground into meal; food was cooked and baked; cloth was woven and sewed into garments; and the use of the metals, even of iron, was known. The numbers as far as a hundred had been named, the decimal principle being followed. The name for a thousand had not come into requisition until after the dispersion, for it differs in the different Aryan tongues.

The Aryan religion consisted in a worship of natural objects and phenomena, more especially of the sun and dawn, and other bright powers of day; but it was *henotheistic* rather than polytheistic, as out of the many gods he believed in, the worshipper prayed to one only at a time. The gods ruled the world, dwelling like a human family with the *dyauspitar* (*Diespiter*) at their head. This 'father of heaven' was the 'bright' sun, the stars and moon were his sons and daughters. Fragments of the hymns addressed to the gods, framed while abstract language did not yet exist, and every word was a metaphor, originated those stories of gods, heroes, and monsters, which, with more or less of variety, but still with a family likeness, formed the primitive mythology of every member of the group. Curious parallels, however, between Aryan mythology and that of savage races not ethnologically connected with the Aryan have been pointed out by Lang and others, and have given rise to discussion whether these are due to transmission, or to the essential identity in the working of the human mind at equal levels of culture.

The theory of the European origin of the Aryans, advanced by Omalius d'Halloy in 1839-44, and by Latham (q.v.) in 1862, was supported by Spiegel and Benfey, and finds many adherents. See Poesche, *Die Arier* (1878); Penka, *Herkunft der Arier* (1896); Schrader, *Prehistoric Antiquities of the Aryans* (trans. by Jevons, 1890); and Isaac Taylor, *The Origin of the Aryans* (1889). Some European languages would then be truer representatives of the old Aryan tongue than the Indic ones. The original home of the Aryans would be Scandinavia, or the neighbourhood of the Baltic; and the Aryan himself, a coarse nomad, without metals, clothed in skins. Poesche assumes that the Aryan languages were the product of the white race, whose colour was due to the albinism caused by a long residence in the marshy country between the Niemen and the Dnieper. But as Sayce points out, the weight of evidence from comparative philology is against other than an Asiatic cradle for the Aryan tongue. The parent-speech need not have been one undivided uniform tongue, but may already have been split up into dialects, like the provincial Latin that developed into the Romanic languages of modern Europe. Though the original Aryan people may have been living together north or north-west of the Black Sea shortly before their dispersion, it does not follow that that region was their original home. The recent discovery of traces

of a hitherto unknown Indo-European language—that of the Tochari—in East Turkestan yet remains to bear fruit.

See Sayce's *Introduction to the Science of Language* (new ed.); Schrader's *Reallexikon der Indogermanischen Alterthümer* (1901) and *Die Indogermanen* (1910); Sigmund Feist's *Kultur, Ausbreitung, und Herkunft der Indogermanen* (1913); Bender's *Home of the Indo-Europeans* (1922); also ETYMOLOGY, PHILOLOGY, MYTHOLOGY.

Arya Samaj, an important school or association of Hindu religious and social reformers, claims, unlike the eclectic Brahma Samaj, to be based on the Vedas as the source of Divine revelation. The founder, Swami Dayananda Saraswati (1824–83), was the son of a landholder, money-lender, and revenue-collector in Kathiawar, who was early initiated into his father's Saivite faith (see SIVA); but, becoming dissatisfied with idolatry, passed through various stages of ascetic or sunyasi life in 1875 he founded at Bombay the first Arya-Samaj. He claimed to find in the Vedas not merely rules of life but all that was essential in modern science. On the other hand, he did not find that the Vedas sanctioned idolatry or caste, and these the society aims at abolishing, as well as at securing marriage reform, cleanliness, female education, abstinence from alcohol and animal food. On special occasions, the Aryas even perform the ancient Vedic 'hom' sacrifice. In patriotic antithesis to the Brahma Samaj also, they are hostile to Western thought and culture generally, and, becoming more and more political, have been largely associated with the Nationalist movement—some of them with anti-English and anti-European agitation. Their numbers were given by the census of 1921 at 467,578, but are probably not fully revealed by the official figures. See books by Lillingston (1901) and Lajpat Rai (1915).

As was the designation both of a Roman weight (called also *libra*) corresponding very nearly to an English *pound*, and also of a coin made of the mixed metal *aes*, or bronze, which originally no doubt weighed a (Roman) pound, of the value of about 8½d., and took the form of a bar. Later there were thirty-six coins (*asses*) or more to the pound, and the value decreased correspondingly. Under Augustus it was worth a little less than ½d. See SESTERTIUS.

Asa, son of Abijah, and third king of Judah (956–916 B.C.), strove zealously for the purity of religion, and to strengthen the defences of his kingdom. He repelled with immense slaughter an Egyptian invasion, and waged successful war against Baasha, king of Israel, with the aid of the Syrian monarch, Benhadad.

Asa Dulcis (i.e. Sweet Asa), a synonym of Benzoin (q.v.). This name was applied to the gum-resin when it began to be imported into Europe in the early part of the 16th century.

Asafoetida, or ASSAFŒTIDA (i.e. Fetid Asa or Assa), is a gum-resin, which has been supposed to be identical with the exuded juice of the *Silphium* of Dioscorides, so highly esteemed among the Greek physicians. Its name is derived from the Persian word *asā*, 'mastic.' The drug is procured by drying the milky juice which flows from the root of the plant *Ferula* (*Narthex*) *asafoetida*. The root of the asafoetida plant is long, and generally undivided; white inside, but having a black covering; and contains in its interior a quantity of juice of an overpowering odour, which much resembles that of garlic. *Ferula* or *Narthex asafoetida* has its radical leaves tripartite, their segments bipinnatifid, and nearly two feet in length.

Asafoetida is prepared in the dry southern provinces of Persia, but chiefly in Khorassan and

Afghanistan, and also to the north of the Hindu Kush range of mountains. About April, the root-

leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks, a slice is cut horizontally from its summit, this operation being repeated at intervals of a few days till the root is exhausted, and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly shaped tears, agglutinated together by a softer substance. Asafoetida is used in medicine, and possesses stimulant and anti-spasmodic properties. When taken internally, it undergoes absorption, and may be detected in almost every secretion of the body, as the saliva, breath, and urine. According to the analysis of Pelletier, asafoetida is composed of the following substances: resin, 65 parts; volatile oil, 3·6; gum, 19·44; bassorin, 11·66; various salts, ·30. In many parts of the East, this drug is used as a condiment, in which respect it seems to take the place of the garlic of some European nations.

Asaphus. See TRILOBITE.

Åsar is the Swedish name given to long winding banks and ridges of gravel and sand, which occur abundantly in the low grounds of Sweden. They often run continuously for more than 100 miles—sometimes one dominant ridge being joined by many tributary ridges, just as a river by its affluents. They are believed to have been formed underneath the great *mer de glace* which covered Sweden during the Glacial Period (q.v.), and to mark the site of sub-glacial streams and rivers. Similar gravelly ridges occur in Ireland, where they are called *esker*, and in Scotland, where they are called *kames*—a name which has been applied to similar gravelly accumulations which occur in the northern states of the American union.

Asarabacca

(*Asarum europæum*), a plant of the order Aristolochiaceæ (see ARISTOLOCHIA), a native of Europe, growing in woods; but rare (an escape from cultivation) in Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic, and were formerly considerably used in medicine, especially in the preparation of snuffs used in the treatment of catarrh, &c.—A nearly allied species, *A. canadense*, a native of Canada, is stimulant and

Ferula asafoetida.

Asarabacca
(*Asarum europæum*).

diaphoretic, and is used, under the name of Canada Snakeroot, instead of *Aristolochia serpentaria*. It is also called Wild Ginger, and used as a spice, being of a warm aromatic quality, and not acrid, like its European congener.

Asben. See Air.

Asbes'tos, a mineral of a fine fibrous character, the fibres sometimes combined together in a compact mass, sometimes easily separable, elastic and flexible. It is generally of a whitish or greenish colour, and has a silky or vitreous lustre. The variety called 'rock-cork' much resembles cork, is soft and easily cut, and so light as to swim in water. 'Mountain leather' and 'rock-wood' are not so light. Another variety is called 'mountain paper.' The finest fibrous variety, with easily separable fibres, is called *Amianthus* (from a Greek word 'unpolluted,' as *asbestos* is 'indestructible'), because cloth made of it was cleansed by passing it through fire, and was used, it is said, by the ancients to enwrap dead bodies placed on the funeral pile, so as to preserve the ashes of the body unmixed. Asbestos is a mineral of the Amphibole (q.v.) group. The name is also applied to a kind of Serpentine (q.v.) and sometimes to a Pyroxene (q.v.). Most of what was formerly used in the arts was amphibole or pyroxene, the main supply for long being amphibole from Corsica and Italy. The bulk of what is now produced is serpentine, like that of Quebec province in Canada, first obtained in 1877. Canada produces the greater part of the world's supply. Asbestos is worked in a number of the states of the American Union, in Italy, Tyrol, Australia, and New Zealand; and is found in North Wales, Ireland, Shetland, and the north of Scotland; 'Cape asbestos' from Griqualand West is Crocidolite (q.v.). Asbestos is now applied to many and very various purposes. It is largely employed in the form of cloth or canvas as a filtering medium for corrosive liquids, while as millboard or cardboard it has an extensive application in the form of washers for fire or acid proof joints. Steam stopcocks are now constructed in which the key or plug works in a chamber closely packed with fibrous asbestos; while for all kinds of engine joints, boiler man-holes, and similar situations, the imperishable nature of asbestos renders it specially valuable. It has recently come into extensive use in the construction of gas fires. At first the coarser varieties only were used, being ground to powder, and then made into balls of a reddish-brown colour by means of fireclay. These being heated by some form of Bunsen-burner (q.v.), became red-hot, and radiated out a large proportion of heat. Later inventors, however, tend to use the filamentous white variety, in combination with a network of iron, for the purpose of producing a more cheery fire, the thin fibres being readily raised to a white heat. Mixed with cement it is used for building and roofing purposes, for gas and water pipes, and as a substitute for pottery and tins. Asbestos paint has been much used to render wooden buildings more or less fully fireproof, but it is apt to peel off. Wood treated in this way does not burst into flame, but only smoulders away under the influence of heat. As a non-conductor of heat, asbestos has valuable properties; a sheet of it placed on a table enabling red-hot vessels to be put down without danger. It is used for so many and various purposes as packing for all classes of machinery, fire-escapes, firemen's clothing, furnacemen's gloves, fireproof putty, sheeting, boiler and steampipe covering, millboard for every purpose, paper, cloth for filtering acids and other similar uses; for covering rollers in print-works (where aniline dyes are employed, and it is necessary to resist heat and the action of the acids); for

flooring-felt, roofing-felt, and wall-felt, more especially in timber-built houses; as a lubricant for every kind of engine; for portable fireproof safes, and for lamp-shades; for curtains in theatres; as a non-conductor in electrical work, as tubing for covering telegraph wires, and for electricians' gloves. Asbestos paper, printed with a pattern, has been used to cover wooden partitions. In its manufacture the lumps of crude asbestos are put through an ingenious crushing-machine, whose rollers have a parallel motion in addition to their rolling action over each other. This action effectually opens out the fibres, which are then boiled in large tanks. The shorter fibres having been ground down and reduced to a pulp, are converted into asbestos millboard by manipulation on gauze netting. The longer fibres on leaving the crushing-machine are woven into yarn and cloth in looms.

Asbjörnsen, PETER CHRISTIAN, one of the most popular among Norwegian authors, was born 15th January 1812 at Christiania. He studied at the university in his native city, then found in the leisure of a four years' residence as a tutor in the country the opportunity to learn thoroughly the life of the common people. In long journeys on foot he collected a rich store of popular poetry and folklore. On his return to the capital he devoted himself to the study of medicine and the natural sciences, and from 1846 to 1853 he explored and dredged, at government expense, various parts of the Norwegian coast, without neglecting the while any opportunity of prosecuting his favourite study. In the years 1849-50 he accompanied a Norwegian ship of war to the Mediterranean, and from 1856 to 1858 he studied forestry at Tharandt in Saxony. Appointed inspector of forests for the Trondhjem district in 1860, he was sent by government in 1864 to investigate the manufacture of peat in Holland, Germany, and Denmark. On his return he was appointed to take measures for its better manufacture among the peasantry, and he resigned this office only in 1876. He died at Christiania, 6th January 1885. Asbjörnsen lived a busy and useful life, and wrote many scientific and practical books on such subjects as natural history, forestry, peat-manufacture, marine fauna, and sensible cookery; but it is not by these, but by his inimitable collections of folk-tales, that his name will be remembered. He first opened the eyes of his countrymen to the rich treasures of poetry and quaint folklore that were to be found among simple and honest country-people; and it is hardly too much to say that to his collections is directly due the growth of the national element in Norwegian literature which has since become predominant in the literature, art, and music of the country. He was fortunate in finding, for his first collection a coadjutor with almost as fine poetic sympathy as himself, Jörgen Moe, afterwards Bishop of Christiansand, and one of the most considerable poets of his time. The two friends published in 1842 the first series of *Norske Folkeeventyr* ('Norwegian Folk and Fairy Tales'), in the vernacular of the country. Asbjörnsen alone published in 1845 the first series of his *Norske Huldreeventyr og Folkesagn*, consisting of stories about the *Huldre*, or fairy of the Norwegian woods, with bright descriptions of the natural scenery and of the characteristic life of the peasantry. Three years later (1848) appeared a second collection; and in 1871 he published also a second volume of the *Folkeeventyr*. These books are now classics in their native literature, and have a place on the shelves of folklorists in all countries. They have been translated into most European languages; into English by Sir George W. Dasent in *Popular Tales from the Norse* (1859), and *Tales from the*

Fjeld (1874); and by H. L. Braekstad in *Round the Yule Log* (1881).

Asbury, FRANCIS, the first Methodist bishop consecrated in America, was born at Handsworth in Staffordshire, August 20, 1745. When sixteen years old he became an itinerant Wesleyan preacher, and in 1771 he was sent as a missionary to America, where he was consecrated in 1784. During a long life of almost incessant labour, it is estimated by his biographer that he travelled about 270,000 miles (mostly on horseback), preached about 16,500 sermons, and ordained more than 4000 preachers. Of great natural ability and indomitable energy, he ranks with Wesley, Whitefield, and Coke in the Methodist movement of his time. He died at Richmond, Virginia, March 31, 1816.

Ascalon, or ASHKELON, one of the five chief cities of the ancient Philistines, lying north of Gaza, on the Mediterranean. It was strongly fortified, had a shrine of the Syrian fish-goddess Derketo, and was the birthplace of Herod the Great. In Solomon's time it was tributary to the Jews; later it became independent, and its kings often kindled the wrath of the prophets. Under the Romans it was a kind of republic, and afterwards the seat of a Christian bishop. The Arabs took it in 637. Before its walls in 1099 the Crusaders, under Godfrey de Bouillon, gained a decisive victory. Recaptured by the Moslems, it was retaken, after a five months' siege, in 1157, by Baldwin III. It was dismantled by Saladin in 1191, and completely demolished in 1270 by Sultan Bibars. The name of this ancient city is preserved in the *Eschalot* or *Shallot*, a favourite kind of onion, first grown in the fertile plains around.

Ascaris, a genus of parasitic worms in the Nematode or Thread-worm (q.v.) order. *Ascaris lumbricoides* is one of the four thread-worms not infrequently infesting man, and especially children. It occurs in the intestine, whence it occasionally works its way into other parts of the body. The thin cylindrical body measures from 6 to 10 inches

A, posterior end of female;
B, posterior end of male.

length, is of a whitish or light-yellow colour, and is pointed at both ends. The surface of the transparent skin is somewhat wrinkled, but there are no internal segments. The sexes are separate, and the less frequent males are distinguished by their turned-up posterior extremity, and the presence of two copulatory spicules. The skin is strong and protective, and forms three lips round the mouth. The muscular system is well developed, and the name *Ascaris* (Gr. *askarizō*, 'to jump') probably refers to the lively motions of some forms. The eggs develop in water or damp earth, and it seems probable that the embryos are directly swallowed by man. This troublesome though rarely dangerous parasite is best dealt with by means of expulsive purgatives. Care as to the purity of drinking-water, and thorough cleaning of vegetables eaten raw, are evident preventive precautions. See PARASITIC ANIMALS, ROUND-WORMS, THREAD-WORMS.

Ascension, a solitary island nearly in the middle of the South Atlantic, 685 miles NW. of St Helena, in 7° 57' S. lat., and 14° 21' W. long. It is said to have received its name from having been discovered by a Portuguese navigator on Ascension-day, 1501. It is 7½ miles long by 6 broad, its area being 35 sq. m. First occupied by the English in 1815, in connection

with Napoleon's detention on St Helena, it is now used only as a sanatorium, having ceased since 1887 to be a coaling depôt. Like St Helena, it is of volcanic origin, being one of the peaks of a submarine ridge which separates the north and south basins of the Atlantic. It rises in the Green Mountain to a height of 2870 feet. The water-supply is drawn from this mountain at a great height above sea-level. The climate is dry and healthy. Several acres of land have been brought under cultivation. Young trees, shrubs, fuize, grasses, and hardy plants have been planted; and a number of sheep and cattle are reared. European vegetables are grown, besides the tomato, castor-oil plant, and pepper. Turtles are very abundant. Several astronomers and savants have visited Ascension, from Halley in 1677, to Darwin, Sir Wyville Thomson, and Sir David Gill. The population is about 250. Until 1922, when it was handed over to the Colonial Office and annexed to St Helena, it was under the control of the Admiralty, and persons born in it were deemed to be born at sea and registered in the parish of Wapping. See Lady Gill's *Six Months in Ascension* (1879).

Ascension, RIGHT, the name given in astronomy to one of the arcs which determine the position relatively to the equator of a heavenly body on the celestial sphere, the other being the declination (see ARMILLARY SPHERE). It meant originally the difference of time of rising of the first point of Aries (q.v.) and the heavenly body referred to, on a right sphere. Hence it is called *Right* Ascension. The sphere of the heavens would be *right* if the poles were on the horizon, as is the case at the earth's equator. At all other places, the axis of the celestial sphere is *oblique*—i.e. inclined to the horizon—so that the right ascension of a star gives no *direct* knowledge of its rising time except there. The term right ascension has thus passed into general use as meaning simply the arc of the equator intercepted between the first point of Aries, and the point at which the circle of declination passing through the star cuts the equator. Measured always from west to east, right ascension on the heavens corresponds to longitude on the earth. The right ascension of a heavenly body is ascertained by means of the transit instrument and clock. The transit instrument determines its meridian passage, and the transit clock gives the time at which this takes place. When the first point of Aries is in the meridian, the clock stands at 0 hours, 0 minutes, 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock, therefore, at the passage of any heavenly body gives its right ascension in time, and this, when multiplied by 15, gives the same in degrees, minutes, and seconds. The right ascension is usually given, however, in time. The old term, *oblique* ascension, was given to the right ascension of the point of the equator that rose simultaneously with the heavenly body; and the difference of the oblique and right ascension was called the 'ascensional difference.'

Ascension-day, or HOLY THURSDAY, one of the great festivals of the church, held on the fortieth day after Easter, to commemorate the ascension of Christ into heaven. Its institution dates from the 4th century. The Church of England appoints special psalms for it, and particularly recommends it as a fitting day for the receiving of the communion. Connected with the religious observances of the day were certain civic ones, which in some parts of England and Scotland are continued to this day—viz. *beating the bounds*, or *riding the marches*, though their

religious connection is apparently forgotten. See **ROGATION DAYS**, and **BOUNDS (BEATING THE)**.

Asceticism. Among the Greeks, *askēsis* denoted the training gone through by athletes or wrestlers, who had to harden their bodies by exertion and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions; and in this sense it passed into the language of the early Christians. But to understand the vast influence that ascetic ideas have exercised on the Christian religion, we must look beyond the bounds of its history. Their root lies in the oriental notion of the antagonism between mind and matter. The glowing imagination of the oriental carries the practice of asceticism to a monstrous extravagance, as is seen in the frightful self-tortures inflicted by the yogins (see **YOGA**) and fakirs (see **FAKIR**), the suicides in the sacred Ganges and otherwise, and the practices formerly prevalent of offering children in sacrifice, and of burning widows (see **SUTTEE**). Buddhism, which may be considered as a kind of Puritan reformation of the Indian religion, carried the principle beyond its previous bounds. In its contemning the world, in its inculcating a life of solitude and beggary, mortification of the body, and abstinence from all uncleanness and from all exciting drinks, the object was to keep as distant and detached as possible from this 'Vale of Sorrow' (see the article **BUDDHISM**). The ancient Egyptians sought to confine it to monogamy of the priests, rigid purity, moderate flagellation, and frequent contemplation of death.

It is in this light that we must consider Jewish and Christian asceticism. In the oriental mind, especially in Egypt, circumcision, avoiding of all uncleanness, and fasting, were signs of humiliation before God. Among the Jews, voluntary vows of abstinence, even from lawful food or wine, were practised by prophets and men of special calling, and in certain critical circumstances; but self-castigation continued for long foreign to the sobriety of Judaism, and even hermitism came into established practice only shortly before Christ, in Palestine among the Essenes (q.v.), in Egypt among the Therapeutæ (q.v.).

Asceticism was far less congenial to the reflective nations of the West, above all to the cheerful Greeks. A Greek felt himself as well entitled to enjoyment as his gods; hence Greek religious festivals were pervaded by cheerfulness. The only exception appears to be the Eleusinian mysteries, which never took hold of the people generally, and the passing phenomenon of the Pythagorean fraternity. The attack made by the Socratic school upon the body as the prison of the soul, and the extravagant contempt for the elegances, and even decencies of life, professed by the later Stoics and Cynics, were no genuine fruits of the popular Greek mind; and we must also ascribe to the infusion of oriental philosophy the ascetic tendencies of Neoplatonism, in holding abstinence from flesh and from marriage as chief conditions of absorption into the divinity.

It was into the midst of these ideas that Christianity was introduced. The Jewish converts brought with them their convictions about fasting. Fasting and Nazaritic observances were thought sanctifying preparatives for great undertakings; and the inculcation of abstinence from marriage, on the ground of the expected speedy reappearance of Christ, falls in with the same notion—namely, that the flesh, i.e. the sensuous part of our nature, is the seat of sin, and must therefore, before all things, be rigorously chastened. The spirituality of Christianity, pointing away from

earth to heaven, and opposition to the corruption of the heathen world, combined to make the Christians of the 2d and 3d centuries hold aloof from the world and its wisdom, and favour abstinence from marriage, more especially on the part of the clergy. This ascetic spirit began as early as the commencement of the 2d century to court trial in the perilous practice of men and women living together under vows of continence. But during the first three centuries no irrevocable vows yet bound the devotees to a life-long asceticism. Fasting was also comparatively rare.

But the tendency to outward manifestations now began to grow stronger. The inward and spiritual life of the Christians had greatly declined; and if the previous bloody persecutions had driven individuals from human society into the deserts, the growing secularisation of the church, after Christianity became the state religion, had the same effect to a still greater degree. All this paved the way for the chief manifestation of asceticism—namely, monasticism, which the church found herself compelled by the overwhelming tide of opinion within and without to recognise, and to take under her protection and care. From the African Church, represented by Tertullian and Augustine, a spirit of gloomy and crushing supernaturalism spread deeper and deeper over the Western Church generally, intensifying the ascetic tendencies, and leading to still more marked separation from a despoised world. There were not wanting healthier minds—as Jovianus and Vigilantius—to raise their voices against fasting and the outward works of asceticism generally; but such protests were vain, and became ever rarer.

From the 11th century, the Cathari, Waldenses, and other sects, though ascetics themselves in a way, yet assailed the external asceticism of the church; and so did Wyclif, Huss, and Jerome of Prague, in their premature struggles at reformation. After a preliminary skirmish by Erasmus, the struggle was decided for a great part of Christendom in the reformation of the 16th century; though the Catholic Church and a section of the Anglican Church still set a high value on various ascetic conditions and exercises—a celibate clergy, the monastic life, fasting and penance. Even the disuse of some of the simple comforts of life, such as the disregard of personal cleanliness, has been regarded as a work of holiness. The fundamental principle that salvation is secured by justification through faith, and not through dead works, struck at the root of monasticism and self-mortification in general. Yet the ascetic spirit often shows itself still alive under various disguises even in Protestantism. The extreme forms of Sabbatarianism have a distinctly ascetic colouring; and hostility to dancing, the theatre, card-playing, and other worldly pleasures (if these are not actually regarded as sinful), may be the outcome of ascetic tendencies. The Mennonites inculcated a rigid asceticism; and with the Shakers (q.v.) of America celibacy is insisted on as a virtue. The essence of asceticism is to hold self-denial and suffering to be meritorious in the sight of God, in and for itself. Many traits presented by Puritanism, Methodism, and Quakerism appear ascetic. It is not impossible that vegetarianism, total abstinence, and other recent austerities, though advocated on other grounds, recommend themselves to the feelings of many from their falling in with this deep-seated propensity to asceticism.

Even in the Catholic Church, ascetic practices have been modified in recent times; fastings are less rigorous, and the self-sacrifice of conventual life is more directed to beneficial ends. Mohammedanism (q.v.) has undergone the same change, but Sufism (q.v.) is carried to the greatest excess

in Persia. In the Greek Church, monasticism had always a milder form. See the articles CELIBACY, FAST, FLAGELLANTS, HERMIT, LENT, MONACHISM, PENANCE, PURITANS, RUSSIA, SABBATH, SHAKERS, STYLITES, TEMPERANCE.

Asch, a town of Bohemia, 14 miles NW. of Eger, with silk, cotton, and woollen manufactures, especially of stockings. Pop. 22,000.

Aschaffenburg, a Bavarian town of Lower Franconia, on the right bank of the Main, at the Aschaff's influx, 25 miles SE. of Frankfort. The castle of Johannisburg, a Renaissance pile of 1605-14, overlooks the whole town. The Romanesque Stiftskirche was restored in 1870-81, and there is a reproduction of a Pompeian villa, built for Louis I. in 1842-49. Paper is the staple manufacture. Population, 32,000, principally Catholics. The Romans built a fortress at Aschaffenburg; and here in 976 Otto I., Duke of Swabia and Bavaria, founded the collegiate church (*Stiftskirche*), which after his death came into the possession of the Archbishops of Mainz, and remained with them until the dissolution of the Germanic empire. In 1814, along with the principality of which it was the capital, Aschaffenburg became Bavarian. Near it the Prussians defeated the Austrians, July 14, 1866.

Ascham, ROGER (sometimes *Askam*), a noted writer and classical scholar, was born in 1515 at Kirby Wiske, near Thirsk, in Yorkshire. He received his early education in the family of Sir Anthony Wingfield, and by him was sent, in 1530, to St John's College, Cambridge, where, in 1534, he took his B.A., and, in spite of his avowed leaning to the Reformed doctrines, obtained a fellowship. The study of the classics, especially Greek, had recently been revived at Cambridge, and Ascham's bent impelled him with ardour to these studies. His reputation as a classical scholar soon brought him numerous pupils; and about 1538 he was appointed Greek reader at St John's. He at first opposed the then new method of pronunciation which is still used in England; but afterwards adopted and defended it. His leisure hours were devoted to music, penmanship (in which he excelled), and archery. In defence of the latter art, he published, in 1545, a treatise entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among English classics. For this treatise, which was dedicated to Henry VIII., he was rewarded with a pension of £10, equivalent to about £100 of our present money. In 1546 he was appointed university orator. In 1548, on the death of his former pupil, Grindal, he was called to supply his place at Cheshunt as tutor to the Lady Elizabeth. In this office he gave the highest satisfaction; but at the end of two years abruptly resigned it, on account of a quarrel with the princess's steward. As secretary to Sir Richard Morysin, ambassador to the court of Charles V., he spent three years (1550-53) on the Continent, at Augsburg chiefly, but with occasional visits to Venice, the Tyrol, Carinthia; and in 1553 was published his *Report on the Affairs of Germany*. During his absence, he had been appointed Latin secretary to Edward VI.; and on his return, after the young king's death, the interest of Bishop Gardiner secured him the same office under Mary, his pension being at the same time doubled. His prudence and moderation preserved him from offending by his Protestantism; and after Mary's death, Elizabeth retained him at court in the double capacity of secretary and tutor, which offices he held till his death, 30th December 1568. His principal work, *The Scholemaster*, a treatise on classical education, was published in 1570 by his widow, and has been well edited by

Professor Mayor (1863). His 295 Latin and English letters were included in Dr Giles's edition (3 vols. 1864-65); and his English works were edited by Aldis Wright in 1905. There is a (German) monograph by Katterfeld (1879).

Aschersleben, a town of Prussian Saxony, on the river Elbe, 32 miles SW. of Magdeburg. Population, upwards of 27,000, occupied in agriculture, gardening, and manufactures of woollens, linens, sugar, machinery, and chemicals. In the vicinity are some ruins, falsely identified as the old castle of Ascania, the original seat of the House of Anhalt.

Ascidians, or TUNICATES, are a class of degenerate survivors of ancestral vertebrates. They were observed and well characterised by Aristotle, but were never really understood till 1866, when the discovery of their complete life-history warranted naturalists in removing them from their random position beside molluscs to the base of the vertebrate series. The larvæ exhibit unquestionable vertebrate characters—viz. a spinal cord, brain, and cerebral eye, a notochord, gill-slits, ventral heart, &c. Except in Appendicularia, however, the vertebrate characters of the larvæ are to a large extent lost in the usually sessile degenerate adult. The tail shrivels up, the notochord and spinal cord disappear, the brain is represented merely by a small ganglion, and the whole symmetry of the body is altered. The ordinary ascidians, the sea-squirrels, so called from their power of jerking out water when touched, are common along the coasts of all seas, ranging from low water to twenty fathoms, and usually attached to stones or shells, while some of the more complex forms are free-swimming. Few of them measure separately more than 3 or 4 inches, and most of them decidedly less, but the more or less intimate colonies frequently formed often attain larger dimensions. Chains of free-swimming ascidians sometimes occur several feet in length.

The following account refers primarily to a simple ascidian, and ought to be prefaced by reading the account of Appendicularia (q.v.), which, as has been noted, retains the larval characters lost in other ascidians. The animal has a double-mouthed flask shape, and is enveloped in a transparent, gelatinous, external sheath, which is secreted by the real skin. This test is remarkable as containing Cellulose (q.v.), the substance which forms the cell-wall of vegetable organisms. Through one of the apertures which are usually fringed with minute lobes, and often bear little coloured spots, the water enters the body; through the other the water, feces, and reproductive elements are expelled. The anterior region of the alimentary canal forms a large respiratory pharynx, such as also occurs in one worm-like form, *Balanoglossus*, in *Amphioxus* (q.v.), and in all vertebrates in the embryonic stage at least. As in Appendicularia, a pair of involutions from the skin meet outgrowths from the gut, and establish a primitive respiratory communication with the exterior. In

Fig. 1.

Structure of a simple Ascidian, showing inhalant aperture, leading into respiratory pharynx; looped alimentary canal, opening along with genital duct into cloacal chamber; nerve ganglion between inhalant and exhalant apertures; reproductive organs near the base, eggs in body-cavity, &c.; heart at very base; fixing processes. (After Hæckel.)

the ascidian, however, this simple structure is replaced, as afterwards described, by a multitude of gill-slits opening from the pharynx into a surrounding chamber which communicates with the exterior by a single aperture. The water is drawn in by the mouth, passes through the richly ciliated slits of the pharynx, bathes the blood spread out on the walls, enters the surrounding chamber, and finds its way out by the excurrent orifice. By the same orifice the faeces and generative products reach the exterior. The internal ventral surface of the pharynx exhibits a special groove, which bears cilia and secretes slime. By this means the food particles are caught and wafted along to the beginning of the food-canal proper. The groove, which here forms the nutritive region of the pharynx, is distinctly seen in amphioxus and young lampreys, and seems to be represented by the thyroid gland (see THYROID) of higher vertebrates. The oesophagus, beginning at the lower corner of the pharynx, leads into a stomach provided with a digestive gland, and the intestine loops upwards to end in the cloacal chamber. The pharynx is surrounded by a muscular sheath more or less interrupted. To this the squirting powers are of course due. The nervous system of the adult exhibits no trace of spinal cord; but consists simply of a ganglion lying between the two orifices, and giving off a number of nerves. In the larva the brain has in close association with it an embedded eye, a rudimentary ear, and a ciliated protrusion probably olfactory. The heart differs from invertebrate hearts in being a dilatation of a ventral vessel. It gives off vessels to the respiratory pharynx and other regions, and is remarkable for exhibiting an alternating direction of the circulation, as has also been observed in some worms (Gephyrea). The blood is pumped alternately in opposite directions, at intervals (30 to 200 pulsations) varying with the species and even individual. A closed sac near the respiratory pharynx has been found to contain nitrogenous waste products, and probably represents a kidney. The reproductive organs are usually hermaphrodite, and the testis is sometimes in extremely close association with the ovary. They lie far down in the body, and are often destitute of ducts. When these are present they open, as stated, into the excurrent cloacal chamber. The sex products are not usually ripe at the same time, and self-fertilisation is thus prevented. Asexual reproduction by budding is exceedingly common, and spreading colonies are thus formed. It was in one of the ascidians that the poet Chamisso first observed what is known as *Alternation of Generations* (q.v.)—i.e. that one or more asexual forms are interposed between the sexual. This alternation is sometimes very complicated.

The Tunicates, apart from Appendicularia, are conveniently divided into three groups—Simplicia, Composita, and Consorta—(1) simple forms, including the ordinary sea-squirts, and those which live socially, but without losing their independence; (2) compound forms, where numerous individuals are subordinated in a colony which may be either sedentary or free-swimming; and (3) free-swimming forms in which the sexual generations are united in chains. The first lot may be represented by the common *Ascidia*, *Cynthia*, &c., some of which are eaten; by *Chevreulius*, which has a test with two movable flaps; by the stalked form *Boltenia*; and by the social *Clavellinas*. The *Botryllidae* are among the commonest types of sedentary compound forms, while the brightly phosphorescent cylindrical *Pyrosoma* is free-swimming. The members of the third group have a very complex structure, and exhibit alternation of generations. They are re-

presented by *Salpa* and *Doliolum*. In *Doliolum* the sexual generation (A) gives rise to an asexual form (B); this develops two kinds of asexual buds (C and D), from one of which the sexual generation (A) is again produced. The development of the ascidians, first observed by Kovalevsky in 1866, has secured their position as vertebrates. Stage for stage it exhibits the closest resemblance to the development of amphioxus. The fertilised ovum divides completely and regularly to form a hollow ball of cells (*blastosphere*). One half of this ball is depressed within the other, and the result of this *invagination* is the two-layered oval embryo known as a *Gastrula*. Along the dorsal side of this embryo an axial groove appears—the medullary groove, which becomes converted into a closed canal by the meeting of its two folds. Thus is formed the neural canal of the spinal cord. In the closure a communication is for a time left

Fig. 2.—Compound Ascidian (after Milne-Edwards): Rosettes of 6 or 7 united individuals, with separate inhalant, but united exhalant apertures; *m*, the inhalant aperture; *o*, the common exhalant aperture. The colonies are attached to a piece of seaweed.

Fig. 3. Development of: I, Ascidian; J, Amphioxus; K, Frog. 1, ovum; 2, segmenting ovum; 3, morula or blastosphere; 4, gastrula; 5, further advanced embryo.

between the cavity of the canal and the original mouth of the gastrula. This communication, connecting nerve canal and primitive gut, is known as the *neurenteric canal*. On the back of the primitive gut, towards the posterior end, a band of cells is formed, the beginning of the notochord, which supports the growing tail, and represents in these lowly vertebrates the incipient 'backbone.' The sides of the primitive gut-cavity form posteriorly the lateral muscles. All this time the embryo has been inclosed within its egg-membrane, but with the growth of the tail, two or three days after fertilisation, the imprisoning case is burst, and there is liberated a free-swimming larva—strikingly like a tadpole. At the end of the closed canal, which may be said roughly to represent the spinal cord, there is a dilatation which may be called the brain. In this some progress soon becomes manifest, especially in the appearance of ear and eye, which remain in closest association with the brain, and are lost in the degenerate adult. The remains of the primitive gut form in various ways the respiratory pharynx, the oesophagus, stomach, and intestine of the adult ascidian. About the time the larva is hatched, another very

important organ appears. A pair of outgrowths from the front of the gut meet, and fuse with a pair of dorsal involutions from the skin. The result is a paired atrial cavity, virtually open to the exterior by the two apertures of involution, and connected with the gut at the origin of the outgrowths—i.e. by gill-clefts. After a while a second pair of clefts appear, opening into the same atrial cavity. It must be noted at this stage that a secretion from the skin which began before the larva was hatched, has resulted in the formation of an intact 'test,' which clothes the entire larva, and is nowhere perforated. The free tadpole-like larva now fixes itself, first by a papilla and then by its test, as shown in the diagram, and with attachment the spinal cord, notochord, &c. begin to degenerate. An opening in the test appears opposite the mouth,

Fig. 4.—Attachment and degeneration of larval Ascidian (from Lankester):

b, brain; m, mouth; n, notochord; g.s., gill-slits; t, tail.

which thus becomes at length functional. The paired atrial cavities also open by perforations through the test, and dilate internally so as to embrace the whole of the respiratory pharynx. To this their walls become, indeed, attached, and a large number of gill-slits perforate this double wall. The two openings to the exterior coalesce into one, and the two cavities also unite to form a single peribranchial chamber. The anus has been gradually shunted dorsalwards, and opens into the atrial cavity in the region already referred to as the cloaca. The gradual modification of structure is well illustrated in the accompanying figure. The result illustrates that degeneration which not infrequently follows from sedentary life.

See AMPHIOXUS, APPENDICULARIA, DEGENERATION, VERTEBRATA; also Huxley's *Anatomy of Invertebrates*; Balfour's *Embryology*; Ray Lankester's *Degeneration and Treatise on Zoology*; Herdman's 'Tunicata' in the 'Challenger' Reports; Alder's *British Tunicata* (1905).

Asclepiada'ceæ (or *Asclepiadææ*), a chiefly tropical order of sympetalous dicotyledons, closely allied to Apocynaceæ, from which they are chiefly distinguished by the united filaments and coherent stigmas to which the anthers adhere, as well as by the peculiar orchid-like pollen-masses. They are mostly shrubs, often with twining stems, and almost always possess milky juice, which is usually poisonous, sometimes so much so as to be used for arrow-points, but is occasionally bland, and even in the case of the Cow-plant of Ceylon (*Gymnema lactiferum*) is used as food. It is sometimes also a source of caoutchouc. Some are prized by florists, notably the fragrant Stephanotis, the Wax-plant (*Hoya carnosa*), as well as species of the curious genus Ceropegia, and the cactus-like and carrion-scented Stapelia. A number of species are medicinal, as Indian Sarsaparilla (*Hæmidesmus indicus*); Mudar (*Calotropis gigantea*), so highly prized in the East Indies; *Sarcostemma glaucum*, the Ipecacuanha of Venezuela; *Tylophora asth-*

matica and *Secamone emetica*, the roots of which are used as emetics, and in smaller doses as cathartics, and the former of which is employed as Ipecacuanha in India. *Cynanchum acutum*, which yields a purgative called Montpelier Scammony, and *Vincetoxicum officinale*, which possesses similar properties. Argel, much used for adulterating senna, belongs to this order.—The down of the seeds is sometimes employed as a substitute for silk or cotton; and the stems of not a few species afford useful fibres, as those of the *Asclepias syriaca*, the Mudar and other species of *Calotropis*, natives of India and Persia, *Hoya viridiflora*, *Holostemma Rheedanum*, &c. The Mudar or Yereum fibre is highly spoken of, and the bark of *Marsdenia tenacissima*, a small climbing-plant, yields a fibre called *Jejee*, of which the Rajmahal mountaineers make bowstrings of remarkable elasticity. The fibre of *M. Roylei* is used in Nepal. *Orthanthera viminea*, which grows at the base of the Himalayas, and has long leafless wand-like stems of 10 feet in height, yields a fibre of remarkable length and tenacity, suited for rope-making. The fibres of other species are used in Sindh for making the ropes and bands used in wells, as water does not rot them. A few species, as *Marsdenia tinctoria*, a native of Silhet, yield indigo of excellent quality. There are many species native in North America.

Asclepi'ades, a Greek physician, born at Prusa, in Bithynia, who flourished during the early part of the 1st century B.C. He seems to have wandered about as a not very successful teacher of rhetoric, before he finally settled at Rome, where, by the practice of medicine, he had risen in Cicero's time to considerable fame and wealth. He was opposed to the principles of Hippocrates. Pliny, who professes very little respect for him, reduces his medicinal remedies to five: abstinence from flesh, abstinence from wine under certain circumstances, friction, walking, and 'gestation' or carriage exercise, by which he proposed to open the pores, and let the corpuscles which caused disease escape in perspiration; for his leading doctrine was, that all disease rose from an inharmonious distribution of the small, formless corpuscles of which the body was composed. He also employed emetics and bleeding, but in general consulted the tastes and whims of his patients; his maxim being, that a physician ought to cure surely, swiftly, and agreeably. He is said to have been the first who distinguished between acute and chronic diseases, and the invention of laryngotomy is also ascribed to him; but his knowledge of anatomy was apparently very slight. Gumpert edited the fragments of his writings (Weimar, 1798).

Ascle'pias (or *Swallow-wort*) is the typical genus of Asclepiadaceæ (q.v.). The species are generally erect, seldom climbing and twining, herbaceous plants with opposite, whorled, or alternate leaves and flowers in umbels. They are mostly American.—*A. cornuti* (formerly called *A. syriaca*), Virginian Swallow-wort, or Virginian Silk, is a native of North America, and not of Syria, as was supposed. It is frequently cultivated in flower-gardens. The young shoots are eaten in North America like asparagus, as those of *A. stipitata* are in Arabia. A brown well-tasted sugar is prepared in Canada from the flowers; and the silk-like down of the seeds has been used for the manufacture of textile fabrics, either alone, or along with wool or silk, but is more frequently employed for the preparation of wadding, and for stuffing mattresses and pillows. The plant appears, however, to be chiefly valuable for the fibre of its stalks, which has been used in a small way for the manufacture of thread and cloth in some

parts of North America. The fibre is said to be of very superior quality, and that of other species furnishes muslin and paper in India. The plant rapidly extends by its creeping root-stocks, and readily becomes a weed.—The roots of several other North American species are used as diaphoretics and expectorants, as *A. incarnata*, *A. tuberosa*, &c. The latter is a very ornamental garden-flower, and is called Butterfly Weed and Pleurisy Root in the United States, where it is frequent on stony and sandy grounds. *A. curassavica* is called Wild Ipecacuanha in the West Indies, and a decoction of it is used by the negroes as an emetic and purgative.—It has been attempted to identify the Soma plant, mentioned in the Vedas as yielding an intoxicant from its bruised stem and leaves, as an *asclepias*. Perhaps it was *Ephedra distachya*.

Ascoli (anc. *Asculum Picenum*), a city of Italy, on the Tronto, 83 miles S. of Ancona by rail. It has a fine cathedral and some Roman remains, and manufactures of majolica and glass-ware, silk, leather, &c. It suffered much from an earthquake in 1878. Pop. 30,600. The province of Ascoli Piceno, in Central Italy, belonging to the Marches, has an area of 800 sq. m. and a pop. of upwards of 252,000.—There is another Ascoli (anc. *Asculum Apulum* or *Satrianum*), also an episcopal city, 19 miles S. of Foggia. Pop. 10,000. Pyrrhus here defeated the Romans, 279 B.C.

Ascoli, GRAZIADIO ISAIA, Italian philologist, was born of Jewish parentage at Gorz in 1829, and was destined for a mercantile career, but early devoted himself to the study of comparative philology. His *Studi Orientali e Linguistici* procured him in 1861 a chair of philology at the Milare Academy, and besides founding the *Archivio Glottologico* (1873), he published *Fonologia Comparata* (1870), *Studi Critici* (1861–77), and *Lettere Glottologiche* (1886). He died in February 1907.

Ascot Heath, a race-course in Berkshire, 29 miles WSW. of London, and 6 SW. of Windsor. It is circular, only 66 yards short of 2 miles in length; the races, which take place in June, are generally attended by the royal family in semi-state. From the accounts of the Master of Horse for the year 1712, it would appear that they were instituted, not in 1727 as is commonly supposed, but by Queen Anne on August 6, 1711.

Asellio, GASPARO, a celebrated Italian physician, was born at Cremona about 1581, and died in 1626, having been professor of Anatomy and Surgery at Padua. In 1622, while at Milan, he discovered the lacteal vessels, which he seems, however, never to have understood or described with complete accuracy. He left a treatise, *De Lactibus* (1627).

Asellus, a generic name now disused, formerly applied to the cod and other Gadidae. It is retained in the pharmacopoeias, in the name of Cod-liver Oil, *Oleum jecoris aselli*.—The name also denotes a genus of small Isopod Crustaceans, one of which, *A. aquaticus*, the Water Hog-loose, is common in stagnant ponds in Britain. This genus is the type of a family, Asellidae. See WOOD-LOUSE.

Aseptic Surgery. See ANTISEPTIC AND ASEPTIC SURGERY.

Ases, Asgard. See ÆSIR, SCANDINAVIAN MYTHOLOGY.

Asgill, JOHN, an eccentric writer, born at Hanley Castle, Worcestershire (1659), was called to the bar in 1692. Having got into difficulties, he sailed in 1699 for Ireland, where an act for the resumption of forfeited estates promised plenty of lawsuits. His talents gained him a lucrative practice; and in 1703 he even obtained a seat in the Irish parliament. Three years before, however, he had pub-

lished a paradoxical pamphlet, bepraised by Coleridge, to prove that by the rules of English law, the redeemed need not die. Much to his own surprise, the public flew into a rage against this absurd production; the Irish parliament voted it a blasphemous libel, and the astonished author was expelled the House. In 1705 he returned to England, and entered the English parliament as member for Bramber, in Sussex. But the fame of his unlucky pamphlet haunted him perpetually; for the English House condemned it to be burned by the common hangman, and expelled Asgill in 1707. At last he found something like peace in the King's Bench and the Fleet, where, imprisoned for debt, he continued to practise professionally, and to indite innumerable pamphlets. He died in November 1738.

Ash (*Fraxinus*), a genus of trees belonging to the natural order Oleaceæ, and distinguished by very imperfect flowers, in which the calyx is obsolete, and the corolla either wanting or 3-4-partite; the fruit is a *samara*, a seed-vessel winged at the edges and extremity. The leaves are deciduous, and are pinnate with a terminal leaflet. There are about fifty species, limited to the non-tropical parts of the northern hemisphere. The only species indigenous in Britain, and throughout central and northern Europe, is the Common Ash (*F. excelsior*). It is a beautiful and umbrageous tree, highly ornamental in parks, but extremely injurious to the grass or crops immediately around it. It rises to the height of 70–100 feet, often with a fairly clean stem. The wood is white, tough, and hard, much valued by wheel-wrights, cart-wrights, coach-makers, implement-makers, &c. It ranks next in value to that of the oak for strength and durability, and is adapted to a much wider range of uses. It is also excellent for oars and for aeroplanes. When irregular in the disposition of its fibres, and finely veined, it is prized by cabinet-makers. The wood of the young trees is almost as valuable as that of the old. Indeed, the value of the timber is greatest in trees of which the growth has been rapid, as it exhibits the characteristic toughness in the highest degree. The ash prefers a loamy soil, and grows best on a good fresh soil, where it is one of our most valuable hardwood timber-trees; and it is also one of our best coppice-trees. Among numerous garden varieties the most remarkable are the Weeping Ash, with boughs bent almost straight down to the ground; the Curl-leaved Ash, with dark-green wrinkled or curled leaves; and the Entire-leaved Ash, a very curious variety, with many or all of the leaves simple (not pinnate), which has been erroneously regarded by some botanists as a distinct species, and named *F. simplicifolia*, *F. heterophylla*, &c.—The Small-leaved Ash (*F. parvifolia*) and the Lentisk Ash (*F. lentiscifolia*) are both natives of the shores of the Mediterranean, and are very graceful and ornamental trees.—The American Ash, or White Ash (*F. americana*), is readily distinguished from the Common Ash by its lighter bark and paler green leaves. It is abundant in New Brunswick and Canada, but becomes rare to the south of New Jersey. It is the best ash for growing on dry soil, and produces a very tough and elastic wood prized for oars.—The Red Ash or Black Ash (*F. pubescens*), is very similar, but of smaller size, and has a deep brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground.—The Black Ash, or Water Ash of the New England States, New Brunswick, &c. (*F. sambucifolia*), is a large tree with buds of a deep blue colour.—The Blue Ash of Ohio, Kentucky, Tennessee, &c. (*F. quadrangulata*), is also a large tree. The branches are quadrangular, the young shoots having on the angles four membranous

which extend their whole length.—The Green Ash (*F. juglandifolia*=*F. viridis*), characterised by its brilliant green young shoots, is chiefly found in the middle States; and the Carolina Ash (*F. caroliniana*), remarkable for the great size of its leaflets, chiefly in the southern States. Besides

Branch of Common Ash (*Fraxinus excelsior*): a, fruit.

these, North America produces a considerable number of other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the Common Ash, but none of them have proved of value as forest trees in this country. The Common Ash suffers much from late frosts, rabbits, and fungus canker.

Among other trees bearing the name ash in one form or other is the Manna Ash, or Flowering Ash (*Ornus europæa*), closely related to the true ash, and formerly named *F. ornus*, but now, on account of some structural distinctions in its flowers, generally regarded as a separate genus. The tree strongly resembles the Common Ash in foliage, but is smaller, and cannot be considered a timber tree of any importance. It is a native of the south of Europe, and is very abundant in Sicily, whence the finest manna is obtained. An allied species (*O. rotundifolia*), a native of Greece and the Ionian Islands, also produces manna in quantity, but not equal in quality to that of the other species. Manna is the concrete juice of these two trees, and is obtained by means of transverse incisions in the bark, but it often also exudes spontaneously during the heat of summer.—The Mountain Ash, or Rowan Tree (q.v.), so called on account of the resemblance of its foliage to that of the Common Ash, belongs to the natural order Rosaceæ.

The ash has a peculiar importance in Scandinavian mythology. The first man and woman formed were Ask and Embla (Ash and Elm). The court of the gods is represented in the Edda as held under an ash, called Yggdrasil (q.v.). The ash was in many countries, and from ancient times, believed to be a powerful defence against witches, fairies, poisonous animals, and some diseases. In the Highlands of Scotland, ash sap was administered to infants as their first food; elsewhere, herd-boys preferred an ash rod as a herding stick; in Cornwall a single blow from an ash wand was death to an adder. Gilbert White tells that in Selborne ruptured children used to be passed naked between the sides of a cleft ash tree in order to be healed. It was held dangerous

to break a bough from the ash. The Mountain Ash (see ROWAN) had also magical powers.

The Poison Ash (*Rhus venenata*) is a gum or varnish bearing tree or shrub of North America, and belongs to the natural order Anacardiaceæ.—The Bitter Ash (*Simaruba officinalis*) yields the powerful tonic drug known as *Simaruba Bark*. The tree is a native of the West Indies.—The Cape Ash (*Ekebergia capensis*) is a valuable timber tree of the Cape of Good Hope; among the timber trees of the Cape it occupies a similar position to the Common Ash in this country, but is in no way related to the latter; it belongs to the natural order Meliaceæ.—Prickly Ash (*Xanthoxylum fraxineum*) is a native of the United States, where it is also called Toothache Tree. The bark, the leaves, and seed-vessels abound in volatile, aromatic, oily and resinous constituents, and a peculiar principle named Xanthoxylin, which are used in the United States in various forms for the cure of toothache and chronic rheumatism.

Ashango, a tribe of Western Equatorial Africa, inhabiting a thickly-wooded plateau (1000 to 1500 feet) south of the Ogowé, 230 miles from the Atlantic coast. They are great slave-holders, are very superstitious, and are broken up into several sub-tribes. Among these are the Obongo, a race of hairy, yellow-skinned dwarfs, whose average height does not exceed 4 feet 4 inches. They live well within the limits of French Congo.

Ashanti, or ASHANTEE, part of British West Africa, lying inland (6°–9° N., 0°–3° W.) between the Gold Coast Colony proper and its Northern Territories; area, over 20,000 sq. m.; pop. 300,000. It is hilly, densely forested, and well watered, but none too healthy, especially in the lower alluvial districts. The land in the neighbourhood of the towns is carefully cultivated, and is extremely fertile, producing maize, millet, rice, yams, tobacco, sugar, cocoa, the pine-apple, and other fine fruits, with gums, dye-woods, and timber. The principal exports are gold and gold-dust, palm-oil, india-rubber, cocoa, kola. The natives, mostly strong and well developed physically, speak a language (or languages) belonging to the Tshi group. They show much skill in certain articles of manufacture. Polygamy is universal. Fetish worship, ancestor worship, and animism constitute the religion; human sacrifices were formerly in vogue. The capital is Kumasi (or Coomassie, q.v.).

The traditions of the Ashanti state point to an emigration some hundreds of years ago from the north, probably caused by the spread of the Mohammedan empire of Timbuktu. In 1700 Kumasi was made the capital by Osai Tutu, who conquered Akim, Assin, Gaman, Denkira, and other neighbouring states, and became a sort of feudal sovereign over a large district. In their course of conquest over the Fantis, the Ashantis became involved in war with the British (1807–26), and were finally driven from the sea-coast. In 1873–74, in consequence of disputes arising in connection with the cession of the Dutch forts to Britain, they were again involved in a war with the same power; and an army under Sir Garnet Wolseley forced its way to the centre of the kingdom. After a severe battle at Amoafu, Kumasi was taken (4th February 1874) and burned. Internal disorder necessitated another expedition in 1895–96, which led to the submission and exile of King Prempeh. No successor was appointed; Ashanti became a British protectorate, and a British Resident was installed at Kumasi. In 1900 a rebellion broke out, and Sir F. Hodgson, governor of the Gold Coast, and his wife were in April besieged with a small force in Kumasi fort, but in July succeeded in cutting their way to the

coast. An expedition under Colonel Willcocks relieved Kumasi (July 15), gallantly held by a few defenders. The campaign ended in the annexation of Ashanti in 1901. It is under the governor of the Gold Coast, but has different laws. A railway runs from Sekondi to Kumasi.

See GOLD COAST, and works by Bowdich (1819, new ed. 1873), Brackenbury (1874), Stanley (1874), Col. Ellis (1893), R. A. Freeman (1898), Lady Hodgson (1901), and Capt. R. S. Rattray (1923); and W. W. Claridge, *History of the Gold Coast and Ashanti* (1915).

Ashbourne, a pleasant market-town of Derbyshire, 13 miles NW. of Derby. Its church (1241) has a fine spire, the 'Pride of the Peak,' 212 feet high, and an exquisite monument by Banks. There are also a grammar-school (1585) and a market-hall (1861). Prince Charles Edward was here in 1745, and here Moore wrote great part of *Lalla Rookh*. Pop. (urban district) 4000.

Ashburton, a small town in the south of Devonshire, on the borders of Dartmoor, $9\frac{1}{2}$ miles NNW. of Totnes by rail. Till 1868 it returned a member to parliament. Pop. of urban district, 2400.

Ashburton, ALEXANDER BARING, LORD, born in 1774, second son of Sir Francis Baring (q.v.), was for several years engaged in the United States, in the service of the great London mercantile house established by his father. On the death of the latter in 1810, he became the head of Baring Brothers & Co., having four years before been elected member for Taunton. He represented that place, Callington, and Thetford in the Liberal interest till 1832, and in 1833 was returned for North Essex as a moderate Conservative. In Peel's brief administration (1834-35) he was President of the Board of Trade, and was created Baron Ashburton in 1835. In 1842 his knowledge of business, and thorough acquaintance with American institutions, caused him to be appointed special ambassador to the United States to settle the north-east boundary question, and other disputes, which then threatened to involve the two countries in war. In August of that year he concluded the famous treaty of Washington, commonly called the Ashburton Treaty, by which the frontier line between the state of Maine and Canada was definitely agreed to. Seven-twelfths of the disputed territory, and the British settlement of Madawaska, were given by it to the United States; but it secured a better military frontier to Britain, and included heights commanding the St Lawrence, which the award of the king of Holland had assigned to the Americans. Provisions were also made for putting an end to the African slave-trade, and for the mutual extradition of criminals. Lord Ashburton opposed free-trade, but strongly supported the penny-postage system when first proposed by Rowland Hill in 1837. He died May 13, 1848.—His son, WILLIAM BINGHAM BARING, second Lord Ashburton (1799-1864), held two or three offices, but is chiefly remembered through his first wife, who made their house a meeting-place of politicians and men of letters, among the latter Thackeray and Carlyle.

Ashburton River, an unnavigable stream of Western Australia, rising in the mountains west of the Great Desert, and flowing 400 miles north-westward into Exmouth Gulf. Its lower course was explored by Sholl in 1866, its upper by Giles in 1876.

Ashby-de-la-Zouch, a town of Leicestershire, near the source of the Mease, a tributary of the Trent, 13 miles NW. of Leicester. It owes its suffix to the Norman family of La Zouch. Their ruined castle, celebrated in Scott's *Ivanhoe*, and rebuilt in 1480 by Sir William Hastings, crowns a

height to the south of the town. Mary, Queen of Scots, was imprisoned here. In the church are the tombs of the Hastings or Huntingdon family. Leather is the staple industry. Pop. 5000.

Ashdod, the New Testament AZOTUS (now *Esdud*), a village on the Mediterranean, 21 miles S. of Jaffa. It was formerly one of the chief cities of the Philistines, strongly fortified, and the scene of numerous contests between that race and the Jews. Into this city the ark of the covenant was brought by the Philistines, and placed in the temple of their god Dagon. About 715 B.C. the town was taken by Tartan, general of the Assyrians; and in the following century it was captured by the Egyptians, under Psammetichus, after a twenty-nine years' blockade and siege. It was destroyed by the Maccabees, and though afterwards rebuilt by the Romans, never regained its early importance. Esdud is now a miserable village with a population of about 300.

Ashdown, the seat of Lord Craven, in West Berkshire, $3\frac{1}{4}$ miles NW. of Lambourn. Here, in 871, Ethelred and Alfred gained the great victory of *Æscudun* over the Danes.

Ashē'ra, the name of a Phœnician goddess, or rather of the idol itself by which the goddess was symbolised. The name is frequently mentioned in the Old Testament in connection with Ashtoreth and her worship, and it appears certain that the latter is the proper name of the goddess, while Ashera is her image or symbol. The image was always of wood, and is probably a survival of tree-worship. The view is now generally given up that it points to the phallic emblem and the licentious rites associated with the worship of Ashtoreth. The translators of the Authorised Version, following the renderings of the Septuagint and the Vulgate, translated the word by 'grove,' spite of the difficulties offered by such passages as 2 Kings xxi. 7 and xxiii. 6; but this error has disappeared in the Revised Version. See **ASTARTE**.

Ashes, the remains of animal and vegetable bodies after burning. It is not strictly correct to speak of the ashes of a mineral. When lead, for instance, is exposed to heat, it turns to dross, which has the appearance of ashes, but is merely the lead combined with oxygen. In the same way, volcanic ashes, as they are called, are only a finer kind of pumice-stone, the solidified scum of molten lava. The ashes of organic substances destroyed by fire consist of the fixed salts contained in these substances. In land-plants, the most important are salts of potash, along with silica and lime; in sea-plants, soda takes the place of potash. By lixiviation of the ashes, the potash or soda is dissolved and separated from the insoluble mass, and is then purified by crystallisation. The ashes of sea-plants contain also more or less iodine. Peat and turf ashes contain, besides alkalies, more or less clay and sand; the same is true of pit-coal, which sometimes contains iron.

At one time the ashes or inorganic ingredients of plants were considered unessential to their existence. But the progress of vegetable chemistry has taught that a certain proportion of saline food is absolutely necessary to the development of plants. The analysis of the ashes of the different kinds of vegetable substances has since become of great interest.

The ashes of animal bodies do not differ greatly from those of vegetables. Bone-ashes consist essentially of lime united with phosphoric acid. This bone-earth is very valuable as manure for grain. In well-wooded countries, ashes from burnt wood form an article of considerable trade. They are much used in the processes of soap-boiling, bleaching, dyeing, glass-making, &c. Wood-ashes

are also used in washing and other domestic processes as a cheap preparation of potash (see POTASSIUM), better known under the names American ashes or pearl-ash.

The presence or absence of ashes is frequently a most important factor in deciding as to the adulteration of articles of commerce. Thus if a sample of milk, flour, mustard, or other substance, on being dried and incinerated, with the necessary precautions, yields more ash than is normally present, it is strong evidence of adulteration, and the analyst can then apply his tests to the ashes obtained, and so determine the nature of the substance which has been added. For volcanic ash, see VOLCANO.

Ashford, an urban district of Kent, 14 miles SW. of Canterbury, and 56 SE. of London. It is an important junction, with large railway works. Eastwell Park, till 1893 the home of the Duke of Saxe-Coburg (and Edinburgh), lies 3 miles to the north. Pop. 14,400.

Ashington, a parish of South Essex, 2½ miles N. of Rochford. Here, in the battle of Assandun (1016), the sixth fought in the year, Canute defeated Edmund Ironside.

Ashkenaz, the name of a northern people mentioned in the table of races given in Gen. x., located in Armenia or its neighbourhood. The later Jews identified it with Germany. At the present day, the Polish and German Jews are termed *Ashkenazim*, as opposed to the *Sephardim*, the Spanish and Portuguese Jews. They have different synagogues, in which a somewhat different ritual and a different pronunciation of Hebrew are used, though there is no doctrinal distinction, nor now any disinclination to social intercourse and intermarriage.

Ashland, a borough of Schuylkill county, Pennsylvania, 84 miles NW. of Philadelphia, with coal-mines, foundries, and machine-shops. Pop. 7000. (2) A city of Wisconsin, on Lake Superior. 280 miles NW. of Milwaukee; pop. 11,000. (3) A city of Ohio, 40 miles WSW. of Akron; pop. 10,000.

Ashlar, or **ASHLER**, building-stone squared and hewn, as distinguished from rubble or rough stones which are used as they come from the quarry without being dressed. Ashlar is laid in regular courses in building, and is of various kinds, according to the style of working that side of the stone which is to form the facing of the wall. Thus there are *tooled* ashlar—the marks of the tooling being either *random* or in *grooves*; *polished* ashlar, in which the face of the stone is rubbed smooth; and *rustic* ashlar, in which only the joints are accurately hewn, the face of the stone being left projecting irregularly. Quarriers apply the term ashlar to squared stones before being hewn. The word is derived from the old Fr. *aisseler*, from Lat. *avillaris*, which is from *avilla*, a diminutive of *axis*, 'axle,' 'plank.' In old documents, the term appears under a variety of forms, such as *achlere*, *ashelar*, *as lure*, and *estlar*.

Ashlar.

Ashley, LORD. See SHAFTESBURY.

Ashmole, ELIAS, antiquary, was born at Lichfield, 23d May 1617, and commencing the study of law when only sixteen, in 1638 became a solicitor. During the Great Rebellion he embraced the Royalist cause, and was appointed a captain of

horse and comptroller of the Ordnance; but at the same time exhibited his love of study by entering Brazenose College, Oxford, where he sedulously applied himself to mathematics, natural philosophy, astronomy, astrology, and alchemy. In 1646 he became acquainted with Lilly and other famous astrologers; and in 1650 he edited a work of Dr Dee's, to which he subjoined a treatise of his own. In 1652 he issued his *Theatrum Chymicum*, and in 1672 his *magnum opus*, a *History of the Order of the Garter*. At the Restoration, various honours and emoluments were conferred upon him; and thenceforward he mainly devoted himself to heraldic and antiquarian studies. In 1682 he presented to the university of Oxford a fine collection of rarities, bequeathed him by his old friend Tradescant, and known as the Ashmolean Museum. He died 18th May 1692. Among his friends were Selden and Dugdale, whose daughter became his third wife. See his quaint *Diary* (1717).

Ashmun, JEHUDI, an American philanthropist, was born at Champlain, New York, in 1794. He was educated for the ministry, but eventually became editor of a magazine in which he advocated the views of the African Colonisation Society for founding a colony of liberated negroes on the west coast of Africa. For this association he conducted a body of liberated negroes from Baltimore, landed at Cape Mesurado, the seat of the infant colony of Liberia, in the autumn of 1822, and assumed the superintendence of affairs. Here, for more than six years, he devoted himself to establishing this colony. His health failing, he returned to America, and died at New Haven, Connecticut, 25th August 1828. See his *Life* by R. R. Guiley (1835), and LIBERIA.

Ashraf, a town in the Persian province of Mazanderan, near the south coast of the Caspian Sea, 56 miles W. of Astrabad. It was a favourite residence of Shah Abbas the Great, and was adorned by him with splendid buildings, of which only a few miserable ruins now remain. It still has some trade in the cotton and silk produced in its vicinity.

Ashtabula, an important railroad city and lake-port of Ohio, 58 miles ENE. of Cleveland. It is one of the leading ports on Lake Erie, with enormous shipments of iron and coal. It has manufactures of leather, machinery, &c. Pop. 22,000.

Ash'taroeth, **Ashtoreth**. See ASTARTE.

Ashton-in-Makerfield, an urban district in south Lancashire, 4 miles S. of Wigan. Pop. 22,500, chiefly engaged in collieries and in the hardware manufacture.

Ashton-under-Lyne, a town of south-east Lancashire, 6½ miles E. of Manchester. It was enfranchised in 1832, and returns one member to parliament. A great seat of the cotton manufacture, it suffered severely during the cotton famine (1861-65). The population is also employed in bleaching, dyeing, and calico-printing, in collieries, and in the manufacture of machines, bricks, &c. Among the buildings are the town-hall (1841), the infirmary (1860), and the old parish church, with tombs of the Assheton family. Francis Thompson was a native. Pop. (parl. borough, including Hurst) 51,500; (munic.) 43,000.

Ashur. See ASSUR, ASSYRIA.

Ash-Wednesday, the first day of Lent (q.v.), so called from the Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom, probably introduced by Gregory the Great (590-604), was sanctioned by Pope Celestin III. in 1191, and afterwards generally prevailed. Before mass, the ashes are consecrated on the altar, sprinkled with holy water, and signed three times

with the cross, while the priest recites the words, *Memento quod cinis es, et in cinerem reverteris* ('Remember that thou art dust, and into dust thou shalt return'). Next they are strewn on the heads of the officiating priests, the clergy, and the assembled people. The ashes are those of the palms consecrated on the preceding Palm Sunday (q.v.).—The Protestant Church in Germany does not celebrate Ash-Wednesday. In the Church of England it is observed, but without anything of the ceremony from which it derives its name; and the *Communion* (q.v.) is appointed to be read in the service for this day.

Asia, the largest of the divisions of the world, occupies the northern portion of the eastern hemisphere in the form of a massive continent which extends beyond the Arctic circle, and by its southern peninsulas nearly reaches the equator. The philological origin of the name, while not quite certain, is probably in an Oriental root meaning 'dawn,' so that the area would be named from the *west*. Certainly the first elements of our geographical terminology originated in Greece, and Asia was a local name given to the plains of Ephesus. This name was apparently extended to the Anatolian peninsula, and later on to the whole of the continent.

Viewed in their broad features, Europe and Asia constitute but one continent, often now called EURASIA, and having the shape of an immense triangle, the angles of which are Spain in the west, the peninsula of the Tchuktkhis in the north-east, and that of Malacca in the south-east. The Arctic Ocean in the north, the Pacific in the east, and the Indian Ocean, continued by its narrow gulf, the Red Sea, which nearly reaches the Mediterranean, enclose the continent of Asia. This immense mass of land touches the latitude of 77° 34' N. in Cape Tchelyuskin, while Cape Burros, at the extremity of the peninsula of Malacca, and 5350 miles distant from the former, falls short by 1° 15' of reaching the equator. Cape Baba, in Asia Minor, advances as far west as the 26th degree of longitude, and the utmost N.E. extremity of Asia—East Cape, 5990 miles distant from Cape Baba—protrudes to the 190th degree (12 hours 40 minutes) to the east of Greenwich. The area covered by Asia and its islands is about 17,600,000 sq. m.; that is, almost one-third of the land-surface of the globe (32 per cent.). It is a seventh larger than the surface of both Americas together, by one-half larger than that of Africa, and more than four times larger than that of Europe.

Boundaries.—Neither by its geographical features nor by its climate, vegetation, and animals, still less by the ethnographical features of its inhabitants and their history, can Asia be sharply separated from Europe. The physical features of both continents show a manifold interdependence; and however pronounced the individuality of Europe in the west, it melts into Asia in its eastern parts; while throughout its history Europe has been influenced by Asia in a thousand ways. Our races have been mixed with those of Asia; in Asia much of our civilisation, our religions, our political and social institutions had their origin; and ever since Europe made an independent start in history, it has never ceased to feel the influence of Asia. Geographically speaking, Europe is a mere appendix to Asia, and no exact geographical delimitation of the two continents is possible. The low Urals are not even an administrative frontier: European Russia extends over their eastern slope. Farther south, the dry steppes of Asia penetrate into Europe and pass indistinguishably into the prairies of Russia. Caucasus is surely Asiatic in character; but, to separate it from Europe, one must resort to

the old dried-up channel of the two Manytch rivers, which at a geologically recent epoch connected the Black Sea with the Caspian. As to Asia Minor—also purely Asiatic in structure and inhabitants—it so closely approaches Europe that the Sea of Marmora and its narrow river-like straits seem almost an artificial boundary, while the islands surrounding Asia Minor mingle with those which continue Greece to the east, and the Anatolian plateau seems to be continued in the Balkan Peninsula.

The line of separation from Africa is better defined by the narrow Red Sea. But Arabia participates so largely in the physical features of Africa that it is in a sense intermediate between the two continents.

In the south-east, the numberless islands of the Dutch Indies—relics of a sunken continent—appear as a bridge towards Australia. The zoological boundary between the two areas, 'Wallace's Line,' runs between Bali and Lombok and up the Macassar Strait; but the physical boundary, as marked by the line of maximum depth of sea, runs east of Timor and up the Molucca Strait.

In the extreme north-east, Asia sends out a peninsula to meet one of the Alaskan peninsulas in America, from which it is separated only by a shallow and narrow channel, Behring Strait. Plants, animals, and men freely migrated over this ferry; while the geographer sees in the two peninsulas a line of connection between the two great plateaus of the Old and New World.

Peninsulas.—Although the coasts of Asia are much more indented by gulfs and peninsulas than those of Africa or America, still it stands in this respect much behind Europe, and has 1 mile of coast-line for every 337 sq. m. of its area, that is, three times less than Europe; besides, about one-fifth of its shores is washed by the ice-bound Arctic Ocean (9900 miles out of 51,000), or by the foggy and icy sea of Okhotsk, where navigation is possible only for a few months, or even weeks, in each year. Its peninsulas comprise nearly one-fifth of its surface (19 per cent., as against 28 in Europe), but they partake of the massive structure of the continent: they are massive too, and, as a rule, little indented. Three immense offsets continue the continent of Asia into more tropical latitudes—Arabia, India, and the Indo-Chinese Peninsula—and some likeness exists between them and the three southern peninsulas of Europe—Spain, Italy, and the Balkan Peninsula, surrounded by its archipelago of hundreds of islands. Asia Minor protrudes between the Black Sea and the Mediterranean as a huge mass of tableland broken by narrow gulfs in its western parts. In the Pacific there are only three large peninsulas—Korea, Kamchatka, and that of the Tchuktkhis—the whole of the Pacific coast having the shape of wide curves turning their convexity to the sea, and indented by but a few gulfs. The flat, ever frozen, uninhabitable peninsulas of the Arctic Ocean, Taimyr and Yalmal, could play no part in the growth of civilisation.

Seas, Coasts.—The early inhabitants of Asia had no Mediterranean Sea to serve as a highway of communication between the southern peninsulas. The open gulfs which separate them—the Arabian Sea and the Bay of Bengal—are wide, open divisions of the Indian Ocean. The narrow, elongated Red Sea penetrates between the dry, stony, and barren lands of Africa and Arabia; and only now, since it has been brought into communication with the Mediterranean by the Suez Canal, has it become an important channel of traffic. The Persian Gulf, inclosed between the deserts of Arabia and the mountains of Persia, is bordered by regions scarcely

inhabited. Asia's true Mediterranean is on the east, where several archipelagoes, like so many chains of islands, mark off from the ocean the Southern and Eastern China Seas, whose Gulfs of Siam and Tonkin, and especially the Yellow Sea with the Gulf of Pechili, penetrate into the continent. Those gulfs, since the dawn of history, have promoted the development of marine traffic in these regions, and would have done so still more but for the dreadful typhoons, the constant danger of these seas. The Sea of Japan is less favoured by climate and currents; it is noted for the narrowness of its continental shelf and for the shallowness of its approaches, the Straits of Korea, Tsugaru, and La Pérouse all being under 100 fathoms in depth. The Sea of Okhotsk and that of Behring, although possessing fine gulfs (Ghizhiga, Anadyr), have no importance for the maritime traffic of nations. Still less the Arctic Ocean, with its wide estuaries and bays, and the Kara Sea, through which ships find a passage amidst the broken ice-crust for only a few weeks in the year.

Islands.—The islands of Asia are very numerous, and cover an aggregate of no less than 1,023,000 sq. m. (nearly 6 per cent. of Asia's surface). The coasts of Asia Minor are dotted with islands, of which the Sporades connect it with Greece. Cyprus was, from remote antiquity, a centre of civilisation; so also Ceylon. The Laccadives and Maldives are mere coral atolls, rising amidst the Indian Ocean, and sheltering some 40,000 inhabitants. The islands of East Asia are much more important. A narrow strip of islands, some large like Sumatra (177,000 sq. m.) and Java, others mere reefs, extend in a wide semicircle, under the name of Andaman and Sunda Islands, from Burma to Australia, separating the Indian Ocean from the shallow Java Sea and the Malay Archipelago. This last—an immense volcanic region inhabited by the Malay race—comprises the huge Borneo, the ramified Celebes, and the numberless small islands of the Moluccas, the Philippines, &c., connected on the north-west with China by the island of Taiwan (Formosa). This latter, as well as Hainan, may be properly considered as part of the Chinese mainland. The Loo-choo (Liu-kiu) Islands and the Japanese Archipelago, the latter joining Kamchatka by the Kuriles, continue farther NE. this chain of islands which border the coasts of Asia. Sakhalin is so closely situated to the continent that it was long regarded as a peninsula. In the Arctic Ocean, Wrangel Land, the small Bear Islands, the Liakhof Archipelago, the islands of the Kara Sea, and Nicholas II. Land, discovered in 1913, north of Cape Chelyuskin, are wrapped in ice-fields, but—by 'wireless' report of ice conditions—the sea route to the Ob and Yenisei (from Tromsø) is practically assured (August 15–September 25).

Orography.—Asia is at once the largest and the highest of all continents. Not only has it a number of mountains which exceed by five and six thousand feet the loftiest summits of the Andes; it has also the highest and the most extensive plateaus. If the whole mass of its mountains and plateaus were uniformly spread over its surface, the continent would rise no less than 2885 feet above the sea, while Africa and North America would respectively reach only 2165 and 1950 feet.

High plateaus are the predominant feature of Asia's orographical structure; they occupy nearly two-fifths of its area. One of them—that of Western Asia, including Anatolia, Armenia, and Iran—extends in a south-easterly direction from the Black Sea to the valley of the Indus; while the other—the high plateau of Eastern Asia, still loftier and much more extensive—stretches NE. from the Himalayas to the north-eastern extremity of Asia, resembling in shape a South America pointing NE.,

and meeting at Behring Strait the north-western extremity of the high plateau of North America. These vast regions, mostly unfit for agriculture and human settlement, poorly watered over wide areas, and assuming there the character of dry deserts, divide Asia into two parts—the lowlands of Siberia and the Aral-Caspian depression to the north of the plateau-backbone, and the lowlands of Mesopotamia, India, and China to the south. These could enter into only occasional communication across the thinly peopled plateaus, and they have followed quite independent lines of development. The southern lowlands are themselves separated into three distinct parts, which have developed independently, without enjoying that continuous mutual intercourse which constitutes the distinctive feature of European civilisation.

(1) *Plateau of Eastern Asia.*—The high plateau of Eastern Asia, which stretches for 4500 miles to the NE. from the Himalayas, occupies more than one-fifth of the superficies of Asia. Its surface is by no means flat, as the rather inappropriate orographical name of 'plateau' might suggest. It has its depressions; it has also on its north-western borders several broad trenches which are cut in its mass, like gigantic railway-trenches leading with an imperceptible gradient from the lowlands to the heights of the plateau. For many consecutive geological periods these trenches were either channels for the drainage of the waters discharged by the plateau, or else gulfs of the seas which surrounded it, so that now their banks, water and glacier worn, appear like chains of mountains to the traveller who follows their flat bottoms. The plateau has also mountain-ridges rising several thousand feet above its surface, and high border-ridges. Its depressions do not usually sink to the level of the lowlands, which in Asia are practically defined by the 3000-foot contour; while the chains of mountains, although rising to high absolute altitudes, are still relatively low, their bases on the plateau being at a level of several thousand feet above the sea. They do not display the diversified aspect usually characteristic of alpine regions intersected by deep fertile valleys; and unvaried monotony—monotony of orographical features, climate, flora, and fauna—remains the distinctive feature of the plateau over immense distances. For thousands of miles the traveller finds the same broad and open valleys, the same harsh climate, the same species of plants and animals, the same unfitness for agriculture.

The highest parts of the East Asian plateau are in Tibet, where it has a width of 1600 miles from west to east, and an average height of from 10,000 to 17,000 feet (sometimes said to be equal to that of the summit of Mont. Blanc; see *TIBET*), and only yak-breeding is possible in these high, cold, dry valleys. The highest plateau of the earth is girdled by the highest chain of mountains, the Himalayas—a typical 'border-ridge' which has one foot on the high plateau, and the other in valleys ten to fifteen thousand feet deeper, where the palm and vine grow freely. This immense chain of snow-clad peaks, which in Europe would reach from Gibraltar to Greece, raises its average summit above 20,000 feet; its lowest passes are 15,000 feet high, and Gaurisankar or Mount Everest—the highest mountain of the globe—has its snow-cap at a height of 29,000 feet, that is, 5½ miles above the sea. A series of chains separated from the Himalayas by high longitudinal valleys run parallel to them in the north, and of these, the Karakorum Mountains rise high above the snow-line; their loftiest peak, the Dapsang, is 28,700 feet high. In the east, the plateau of Tibet is bordered by the snow-clad mountains through which the great rivers of China, Burma, and

Siam find their way to the lowlands. They are still very little known.

In the north-west, the Tibet plateau joins another much smaller, but very high plateau—that of Pamir ('the roof of the world'), which covers an area of 37,000 sq. m. Several chains of mountains running NE. diversify its surface, but still the travellers crossing it need not descend to a level lower than from 10,000 to 11,000 feet until they have crossed its northern border-ridge, the Alai Mountains, whose peak Kaufmann (22,500 feet) exceeds twice the highest summit of the Pyrenees. The Muztaghata peak, in Eastern Pamir, reaches a height of 25,600 feet. Farther north and north-east of the Pamir, a wide, intricate complex of several high chains, running mostly from WSW. to ENE., with several ridges shooting from them to the NW., covers an aggregate area nearly as large as Germany. These mountains are known under the general name of Tian-shan (q.v.). The great Khan-tengri rises there to 24,000 feet, and most of the Tian-shan ridges are snow-clad; even the outer ridges raise their summits to fifteen or sixteen thousand feet—that is, above the upper limits of tree vegetation, while some of their deep, fertile valleys have been transformed into veritable gardens and granaries by means of irrigation.

(2) *Central Asian Depression.*—In the north, the plateau of Tibet is bordered by a succession of lofty chains (Kuen-lun, Altyn-tagh, Nān-shan), reaching more than 20,000 feet in their highest parts. These chains separate it from the great central depression which is occupied by Eastern Turkestan in the west, and by the Desert of Gobi in the east. This great depression—including the Han-hai, or 'dried-up sea,' of the basin of the Tarim—must be considered, however, only as a lower terrace of the great plateau of Eastern Asia. It has an altitude of from 4000 to 5000 feet in the west, but drops to 2600 in Lob-nor, and to -300 in the allied Turfan basin. It has no outlet to the sea—not even to Lake Aral or the Caspian; any winds which might bring the moisture of the ocean are deprived of it in crossing the higher plateaus and border-ridges which surround it, and so this floor of an immense interior sea is rapidly drying up. All through the historical period it has apparently continued to dry up, till Lob-nor has become now but a series of shifting reed-choked swamps, which are migrating westwards under the influence of persistent easterly winds, accompanied by terrific sandstorms—a small remnant of a much larger sea which existed at the dawn of history, and in whose rapid desiccation we probably must look for one of the causes which impelled the Huns and the Mongols to their great migrations towards the west. Human settlements, secluded from the rest of the continent, and rarely visited now by a few caravans, are scattered only in the upper parts of the tributaries of the Tarim, where the water of few and scanty rivers may maintain life; but they were much more numerous before, as is testified by ruins of great cities, now buried under the drifting sands. In the Eastern Gobi, where the SE. monsoons of the Pacific during the summer, if not also the NW. winds from Siberia during the winter, bring some moisture, the gravelly soil is covered with grass for a few months each year; but in the west, man must sustain a hard struggle against the moving sands raised by storms in the air, more dreaded than the worst snow-storms of the far north. In the south-east, towards the chains of Ala-shan and In-shan, the wild horse and the wild camel—ancestors of our domesticated breeds—find their last refuge on lonely pastures scarcely ever visited by man.

(3) *Northern Part of the Great Plateau.*—The dry and barren ridge called Eastern Tian-shan,

and two other ridges running NW., separate the Han-hai depression of Central Asia from the trenches of Urumsai and Urungu, which descend west to the lowlands of Siberia towards Lakes Balkhash and Zaisan. Beyond the great depression the plateau rises again, and reaches an average height of from 4000 to more than 5000 feet in the upper parts of the Yenisei and Selenga, and about 2370 feet in its lowest part—the small depression of Lake Ubsa-nor. The Ektagh (or Great Altai) in the west, the Khangai and the Yablonovoi ridge farther east, separate this northern terrace of the plateau from the lower terrace of Eastern Turkestan and Gobi. It would seem that the Yablonovoi ridge is continued farther SW. by a succession of ridges which probably join the Tian-shan Pelau (Eastern Tian-shan), and which separate the higher western terrace of the plateaus from the lower terrace of the Gobi. This last has in the east its border-ridge—the Great Khingan (6000 to 8000 feet)—which is a continuation of the richly mineralised mountains of Shansi; it is pierced by the Amur below Albazin, and in the north-east joins the Stanovoi or Okhotsk coast-ridge.

In the north-west the plateau is bordered by the snow-clad Sailughem ridge of the Altai (Byelukha, 14,800 feet), which appears as a continuation of the Tian-shan and the Ala-tau, and which is continued farther NE. by the West Sayans. A wide indentation, however, occupied in its deepest parts by Lake Baikal (and very much like the indentation made by the Caspian in the plateau of Western Asia), breaks the continuity of the border-ridge. This last reappears again in the east of the Siberian lake as a huge wall, known under the names of Khamar-daban, Barguzin, Muya, and Tchera mountains. The Sayan ridges average 7000 feet above the sea, but reach a maximum 11,500 in the Munku-Sardyk, and present their steepest slopes towards Siberia (q.v.), while their inner base lies on a plateau 3500 to 4500 feet high. Between the Sayan and Yablonovoi ranges lies the broad Vitim-Selenga rift, where the valleys of the Selenga and its Uda tributary afford two great highways from Lake Baikal to Mongolia and the Upper Amur. A broad zone of alpine tracts more than 150 miles wide and 2000 miles long—the Altai, the Kuznetskiy Ala-tau, the Baikal, Lena, Olekma, and Vitim mountains—fringes this plateau in the west, from Lake Zaisan to the far north-east of Siberia. It consists of a series of short chains, mostly running NE., with numerous spurs, and intersected by deep and narrow valleys, clothed with forests and rich in auriferous deposits. A like succession of alpine tracts, although narrower, follows the south-east edge of the plateau in China and Manchuria. As to the plateau itself—whose surface is diversified by several chains rising above its level—its broad, flat, open valleys, though scarcely fit for agriculture in consequence of their altitude, have none of the dryness of the plateau of Tibet. They are covered with a rich grass-vegetation, and are frequented by shepherds; while the slopes of the hills, thickly clothed with forests, are rich hunting-grounds. Farther north, in the Vitim plateau, the Aldan, &c.—the surface becomes very marshy, and the vegetation still poorer; its height does not now exceed 3500 feet, and it becomes narrower. Its north-eastern extremity—the abode of the Tchukchis—is but very little known.

(4) *The Plateau of Western Asia.*—Several parallel chains of mountains, reaching 24,000 feet in their highest parts, and running NE. to SW.—the Hindu-Kush and its parallel chains—connect the great plateau of Eastern with that of Western Asia, which may be subdivided into three parts: Iran, Armenia, and Asia Minor. The plateau of Iran (1,000,000 sq. m.) is bordered in the north-east

by the border-ridges of the Paropamisus, the Kopet-dagh, which presents its steep, stony slopes to the Turkoman Steppes, and the Elburz (with its peak Demavend, 18,000 feet high), which describes a curve around the South Caspian shore; in the east it is fringed by several snow-clad chains, which separate the stony plateaus of Afghanistan and Beluchistan from the fertile valley of the Indus; and in the south-west it falls by several steep terraces towards the Persian Gulf and its continuation—the valley of the Tigris and Euphrates. The lowest parts of the Iran plateau, in the valley of the Helmand, which discharges its water into the rapidly desiccating Sawarash swamp, are 3500 feet above the sea, and the plateau, although fertile in the south-east, merges, through karst landscape in salt-desert, towards the Caspian Sea. There it joins the plateau of Armenia, bounded on the north by the Anti-Caucasus, and in the south by the Kurdistan Mountains. The great salt lakes Van and Urmia have their levels at altitudes of more than 5000 feet; and Mount Ararat, which rises on the plateau, reaches a height of 17,900 feet. Farther west the plateau of Armenia meets that of Asia Minor, all three together making a wide plateau, elongated towards the north-west, and having a length of 2700 miles and a width of from 700 to 180 miles. Several chains of mountains running NE. and NW., and reaching more than 10,000 feet in their loftiest summits, intersect the plateau of Asia Minor, which is bordered by the Taurus Mountains on its Mediterranean coasts, and the Pontic Mountains on the Black Sea shore.

(5) *Separate Chains of Mountains.*—The hilly tracts of Asia are not confined to the plateaus and their border-ridges. The Caucasus, an immense wall of snow-clad mountains, stretches NW. to SE. for over 700 miles along the border of the Armenian plateau, from which it is separated by the broad valley of the Kura. It reaches 18,530 feet in the Elborus (Elburz) peak. The Urals, from 2000 to 4000 feet high, which separate Europe from Asia, are a broad belt of hilly tracts, stretching as a whole from north to south. Farther east, the Karatau and the Tarbagatai, as also the Verkhoiansk ridge in the far north, strike off from the alpine tracts which fringe the plateau, and have a direction perpendicular to them; while the Byrranga hills diversify the monotony of the *tundras* of the Taimyr Peninsula. The Yeniseisk Mountains, consisting of several chains running SW. to NE., contain rich treasures of gold-dust. Several chains, little known, and some of them volcanic, fill up the peninsula of Kamchatka. A number of parallel chains, 5000 to 7000 feet high—the Ilkhuri-alin, the Bureya Mountains, Pribrezhnyi, and Tartar—run from the Gulf of Pechili to the Sea of Okhotsk, and are continued in Sakhalin Island; while other chains having the same direction form an outer submarine wall of Asia in Korea, the Japan Archipelago, and the Kuriles. The Nan-ling, Tayu-ling, and other smaller chains having also the same north-eastern direction, cross South China; and submarine chains belonging to the same system of parallel platings of the earth-crust are seen in the Taiwan (Formosa) and the Loo-choos (Liu-kius). The whole eastern margin—in the south from as far west as the Lower Brahmaputra—has a typical Pacific north-and-south trend, as opposed to the typical east-and-west trend of the main Eurasian mass from the Cantabrians to the Himalayas. It has an equally typical Pacific, or shallow, hinterland. A range of lofty volcanoes rises steeply from the very depths of the ocean in the islands of the Java Sea.

The interior of the Indian peninsula is again occupied by the wide plateau of the Deccan, having an average height of 1500 to 3000 feet, with an extreme of 8760 in the Nilgiris, bordered in the west by the

Western Ghats and the Cardamom Mountains, and in the east by the much lower and broader Eastern Ghats. The Pedrotallagalla peak in Ceylon rises 8330 feet high.

The immense plateaus of Arabia, covered with sand-deserts interspersed with a few fertile regions, rise to altitudes of from 3500 to 4500 feet, and are intersected by several little-known chains of hills. Their south-eastern border-ridge—the Hadramaut—reaches nearly 7000 feet in its highest summits, and the north-western border-ridges—the Lebanon and Anti-Lebanon (Anti-Libanus)—have summits of 10,000 and 9000 feet; while in the deep valley of the Jordan the Dead Sea is no less than 1300 feet below ocean-level.

(6) *Lowlands, Plains.*—The whole of North-western Asia is occupied by an immense lowland—Siberia—which joins in the south the wide Aral-Caspian depression. This lowland, whose level is usually well below six hundred feet, does not reach the outer borders of the above-mentioned alpine regions which fringe the great plateau of East Asia. It is separated from them by a belt of elevated, undulating plains rising to a level of from 1000 to 1500 feet, the limits of which may be roughly indicated by a line traced from Merv to Tomsk, and thence to Verkhoiansk. These plains, which assume the character of dry steppes towards the south, are as a whole highly suitable for agriculture and cattle-breeding. Not so the lowlands proper, which bear unmistakable traces of having emerged from the sea during the Post-Pliocene period. In the Aral-Caspian depression they often have the character of sandy deserts, and can be cultivated only where there is a belt of fertile Löss (q.v.) at the base of the mountains, and the streams issuing from the hilly regions yield sufficient water for irrigation. On the northern coast of the Caspian, the Aral-Caspian depression descends even below the level of the sea; while the dry plateau of Ust Urt rises to an average height of about 1000 feet above the sea. The southern parts of Western Siberia are a perfect granary, and are rapidly being colonised; but beyond the 56th or 57th degree of latitude the lowland assumes the character of marshy forests, almost totally unsuitable for settlements; and farther north, that of a barren and almost always frozen tundra. A like belt of elevated plains, succeeded by one of lowland, runs along the great plateau on its south-eastern edge; and those parts of the plains which are covered in China with loess, as also those of Manchuria to the west of the Pribrezhnyi ridge, are the abodes of a dense agricultural population. In the Indo-Chinese Peninsula, the lowlands are limited to Tonkin, Cambodia, and the lower Menam and Irawadi, where they are fertile, but often marshy.

The wide space between the great plateaus of Western and Eastern Asia and that of the Deccan, watered by the Indus and the Ganges, is again an immense lowland, covering no less than 400,000 sq. m., and supplying the means of existence to 175 millions of inhabitants. Its western part suffers much from want of precipitation; but an artificial canalisation rapidly conquers the desert (see INDIA). Another wide lowland, Mesopotamia, or the broad valley of the Tigris and Euphrates, was a cradle of civilisation (Sumerian) in the remotest antiquity. Finally, the fertile lowlands in the north of the Caucasus are being rapidly colonised by Russian agriculturists.

Rivers.—It is easy to perceive from the above rapid sketch how much the orographical structure of Asia favours the development of very great rivers, whose drainage basins cover immense areas. Only four rivers—the Mississippi, Amazon, Congo, and Nile—surpass the largest rivers.

of Asia, the Yenisei and the Yang-tse-kiang, both as to length and drainage areas; but owing to the scarcity of rain over large parts of Asia, the amount of water carried down by the largest rivers is, as a rule, disproportionately small as compared with American or European rivers. The predominant feature of Asia's hydrography is the existence of very wide areas having no outlet to the sea. On the great plateau of Eastern Asia, the region which has no outlet from the plateau, and whose water does not reach even Lake Aral or the Caspian—the Han-hai and Gobi—covers a surface larger than that of Spain, France, and Germany together. It is watered only by the Tarim, which supplies some irrigation-works in its upper parts, and enters the rapidly drying marshes of Lob-nor. This area is steadily increasing, and since 1862 we have had to add to it the drainage area (as large as England and Wales) of the Kerulen, which empties into Dalai-nor, but no longer reaches the Arguñi, a tributary of the Amur. The Ulyasutai River and the Tchagan-togoi now no longer reach Lake Balkhash; and the Urungu, which obviously joined the Upper Irtysh at no very remote date, empties into a lake separated from the Black Irtysh by a low isthmus not 5 miles wide. If we add, however, to this already wide area the drainage basins of Lake Balkhash with its tributaries, the Ili and other smaller rivers; the great Lake Aral, with the Syr-daria (Jaxartes) and Amu-daria (Oxus), as also the numerous rivers which flow towards it or its tributaries, but are desiccated by evaporation before reaching them; and finally the Caspian with its tributaries, the Volga, Ural, Kura, and Terek, we find an immense surface of more than 4,000,000 sq. m.—that is, distinctly larger than Europe—which has no outlet to the ocean. Four inland drainage areas more must be added to the above—the plateaus of Iran and Armenia, two separate areas in Arabia, and one in Asia Minor, the whole having a surface of 5,567,000 sq. m. See RIVERS.

The drainage area of the Arctic Ocean comes next. It includes all the lowlands of Siberia, its plains, and large portions of the great plateau. The chief rivers flowing north to the Arctic Ocean are the Obi, with the Irtysh; the Yenisei, with its great tributary the Angara, which brings to it the waters of Lake Baikal, itself fed by the Selenga, the Upper Angara, and hundreds of small streams; and finally the Lena, with its great tributaries, the Vitim, Olekma, Vili, and Aldan. Owing to their great tributaries, and still more to the fact that each of them is formed by two great rivers of nearly equal importance, they permit navigation to be carried on, not only north and south, but also west and east, over wide distances in Siberia (q.v.).

Three great rivers enter the Pacific: the Amur, composed of the Arguñi and Shilka, and receiving the Sungari—a great artery of navigation in Manchuria—the Usuri, and the Zeya; the Hoang-ho, subject to frost, like the Amur, and to fierce floods, and of little value for trade; and the great Yangtse (with its tributary the Han), which allows freighted boats to penetrate from the seacoast to the very heart of China. The Cambodia or Me-khong, the Salween, and the Irawadi, rising in the eastern parts of the high plateau, water the Indo-Chinese Peninsula. Rising on the same height, the Indus and the Brahmaputra flow through a high valley in opposite directions along the northern base of the Himalayas, until both pierce the gigantic ridge at its opposite ends, and find their way—the former to the lowlands of the Punjab, where it is joined by the Sutlej, and the latter to Assam and Bengal, where it joins the great river of India, the Ganges, before entering the Gulf of Bengal by a great number of branches forming an immense delta. The plateau of the Deccan is

watered by the Godavari and Krishna, flowing east, the Narbada, flowing west, and a great number of smaller streams. The Tigris and Euphrates, both rising in the high plateau of Armenia, flow parallel to each other, bringing life to the valley of Mesopotamia, and join before entering the Persian Gulf. Arabia Proper has no rivers worthy of notice; only the *wādys*, or dry channels of former rivers, show that there was a time, not far distant, when it was well watered. The Irmak, which enters the Black Sea, is the only river worthy of notice in Asia Minor. In Caucasus, the Rion and Kubafi enter the Black Sea, and the Kura and Terek the Caspian.

Inland Seas, Lakes.—Numberless lakes are scattered all over Asia. A succession of great lakes, or rather inland seas, is situated all along the northern slope of the high plateaus of Western and Eastern Asia, their levels becoming higher as we advance farther east. The Caspian, 800 miles long and 270 wide, is an immense sea, even larger than the Black Sea, but its level is now 85 feet below the level of the ocean; Lake Aral, nearly as wide as the Aegean Sea, has its level 157 feet above the ocean; farther east we have Lake Balkhash (780 feet), Zaisan (1200 feet), and Lake Baikal (1550 feet). Numberless smaller lakes and ponds, all rapidly drying up, break the surface of the steppes and lowlands of Siberia; while in the north, immense marshes cover the low grounds of Western Siberia. Many large lakes appear on the plateau of Tibet (Tengri-nor, Bakha) and on the high plateau of the Selenga and Vitim (Ubsa-nor, Ikhe-aral, Kosogol, Oron); and smaller lakes and ponds are so numerous that maps on a large scale are literally dotted with them. Three large lakes, Urmia, Van, and Goktcha, and many smaller ones, lie on the highest part of the Armenian plateau; whilst among the numerous lakes on the lower plateau of Anatolia, Tuz Geul is the largest. On the Pacific slope of the great plateau, the great rivers of China and the Amur with its tributaries have along their lower courses some large and very many small lakes, which seem like reservoirs where the immense quantities of water carried down by these rivers during the summer rains is stored. The lakes Tun-ting, Po-yang, and Tai-hu, along the Yang-tse-kiang; those along the former course of the lower Hoang-ho; and Lakes Kizi and Hang-ka on the Amur and Usuri, as well as numberless smaller lakes, fall under this category.

Geology.—Asia may be regarded as formed by the fusion of two ancient continents, Angaraland and Gondwanaland, separated till Tertiary times by a midland sea now transformed into Alpine chains; but these early continents were themselves formed by the fusion of ancient cores with younger peripheral growths—first Caledonian, and later Hercynian. Three persistent features, therefore, stand out, at all events from the Cambrian period—a northern nucleus (in South Siberia), a southern nucleus (in the Deccan), and a central depression, in which sedimentation seems to have been practically continuous, the site of the Tertiary Alpine folds. In the southern nucleus only the fundamental rocks have been folded, and the newer beds—from the Upper Palaeozoic—lie on them horizontally and undisturbed except by faulting, the area having been land from at least the Carboniferous period. In the north and west of the continent the sea had retreated during the Devonian period, except on the site of the Urals, which was occupied by a gulf the size of the present Mediterranean; and this area also shows no important recent folding, though some mountains have been 'elevated' from other causes—e.g. the formation of tray-like or trough-like faults. In central Siberia, as in the north-west of the

Deccan, there have been great flows of lava. During the Jurassic period immense fresh-water basins covered the plateaus, and left their traces in Jurassic coal-beds. Carboniferous deposits are met with in Turkestan, India, and Western Asia; while in Eastern Asia the numerous coal-beds of Manchuria, China, and the archipelagoes are all Jurassic. The broad intermediate belt of Mesozoic and later formations has been folded into a series of arcs—lying east and west, and enclosing very slightly disturbed areas; and these now form the mountain backbone from the Taurus to the Himalayas, and even intrude into the 'Pacific' trend—e.g. following the direction of older folds in Burma before resuming their normal direction in Java, &c. The island festoons of the east coast are due to similar causes, though the natural coast-line is probably due to simple faulting. The mountain chains rose above the Carboniferous, Triassic, Chalk, and Jurassic seas which covered what are now the lowlands and lower terraces of Asia; but their upheaval has continued throughout these epochs, so that in the outer chains of Asia we see Carboniferous and younger deposits, up to Tertiary, lifted to great heights. It appears, however, that while the ancient upheavals dating from the azoic epoch had chiefly the direction from south-west to north-east, the more recent upheavals of the Tertiary period have had a direction from north-west to south-east.

What are now the lowlands of Asia must have been widely submerged by the seas of the Tertiary period, as also those of the Quaternary (postpliocene) period. The Tertiary sea of Eastern Asia was broken by chains of mountains into many separate parts, straits and lagoons, while that of Western Asia extended widely over what is now Southern Russia. The sea of the Quaternary period (glacial and post-glacial) no longer reached the plains of Central Asia, nor even the higher plains of Siberia. It covered the whole of the lowlands of North-western Siberia, as far as the 50th degree of latitude, a broad gulf probably connecting the Arctic Ocean with the Aral-Caspian Sea; but there are no traces of it on the high plains of Eastern Siberia, which were only intersected by several narrow elongated gulfs of the ocean. The moistness that thus ensued permitted glaciers (which are wanting now throughout the middle parts of Eastern Siberia and Mongolia) freely to accumulate, so that the whole of the upper plateau and its border-ridges were under a mighty ice-cap. Immense glaciers, like those of the Alps and Jura, covered also the alpine regions. How far glaciation extended over the plateau of Tibet and in China still remains unsettled. In Turkestan and Siberia, immense accumulations of loess fringe the alpine regions; while in China they cover immense tracts, and are the most fertile regions of Asia.

Many important changes in the distribution of land and water have been going on in Asia since the glacial period, and even during historic times. Since the Aral-Caspian Sea became isolated from the ocean, its desiccation, as well as that of the numberless lakes which dotted the surface of Asia during the Lacustrine (post-glacial) period, has proceeded with a rapidity which may be guessed from the very rapid rate at which the process has been observed to go on in Siberia during the last hundred years. All Asia bears unmistakable traces of having been covered during the Lacustrine period with numberless large and small lakes, which have now disappeared, not in consequence of the action of man, but in consequence of some general causes affecting the earth's surface since the last glacial period. The process is still more accelerated by the rapid upheaval of the continent—the whole of the

Arctic coast, as also most of that washed by the Pacific, the Mediterranean, the Red Sea, and parts of the Indian Ocean, being in a state of gradual elevation, while the few areas where traces of subsidence have been noticed are very limited. The influence of the desiccation of Asia has been felt even during historic times, and the migrations of the Ural-Altaians, Turks, and Mongols will probably be best explained if this change in the condition of Central Asia be taken into account; while the same circumstance explains the nearly desert state of those regions which were the cradle of European civilisation.

Volcanoes play an important part in Asia's geology; more than 120 active volcanoes are known in Asia, chiefly in the islands of the south-east, the Philippines, Japan, the Kuriles, and Kamchatka, and also in a few islands of the Sea of Bengal and Arabia, and of Western Asia. Numerous traces of volcanic eruptions are found, not only in the same regions, but also in Eastern Tian-shan, in the north-western border-ridges of the high Siberian plateau, and in the south-west of Aigun in Manchuria. Earthquakes are frequent, especially in Armenia, Turkestan, and around Lake Baikal.

Minerals.—Asia is exceedingly rich in a great variety of mineral products. There are gold mines of great wealth in the Urals, the Altai, and Eastern Siberia; and auriferous sands are found in Korea, Sumatra, Japan, and in the Caucasus Mountains. Silver is extracted in Siberia; platinum in the Urals; copper in Japan, India, and Siberia; tin in Malaya; mercury in Japan. Iron ore is found in nearly all the mountainous regions, especially in Asia Minor, Persia, Turkestan, India, China, Japan, and Siberia; but iron mining is still at a rudimentary stage. Immense coal-beds are spread over China and the islands of the Pacific (Hainan, Japanese Archipelago, Sakhalin), Eastern Siberia, Turkestan, India, Persia, and Asia Minor. They cover no less than half a million square miles in China alone; but the extraction of coal is as yet very limited. Graphite of very high quality is found in the Sayans and Northern Siberia. The diamonds of India, the sapphires of Ceylon, the rubies of Burma and Turkestan, the topazes, beryls, &c. of the Urals and Nertchinsk, have a wide repute. Layers of rock-salt are widely spread, and still more so the salt lakes and springs. The petroleum wells of the Caspian shores, though still producing 20 per cent. of the world's output, are not prospering, partly owing to the competition of the great oil-field which runs from Burma through the Dutch East Indies into Borneo. When modern industry shall spread over the great eastern continent, it will find at hand the best specimens and the greatest variety of mineral products, although it will have to vanquish the obstacles opposed to their extraction by the difficulties of access of the mountain tracts.

A variety of mineral springs, some of them equal to the best waters of Western Europe, are widely spread over Asia. Those of Caucasus and Transbaikalia already attract a number of patients.

Climate.—Even Eastern Europe has quite a continental climate. Still more continental is the climate throughout Asia, with the exception of a part of its coast regions. On account of the immense area of Asia, great differences of climate are met with, and therefore the meteorologists subdivide the continent into several climatic regions. (a) The province of Western Siberia, purely continental, is very cold in the winter and hot in summer. (b) Eastern Siberia is still more continental, colder in winter, and drier; it includes the pole of cold about Verkhoyansk, under 67° 34' N. lat., which

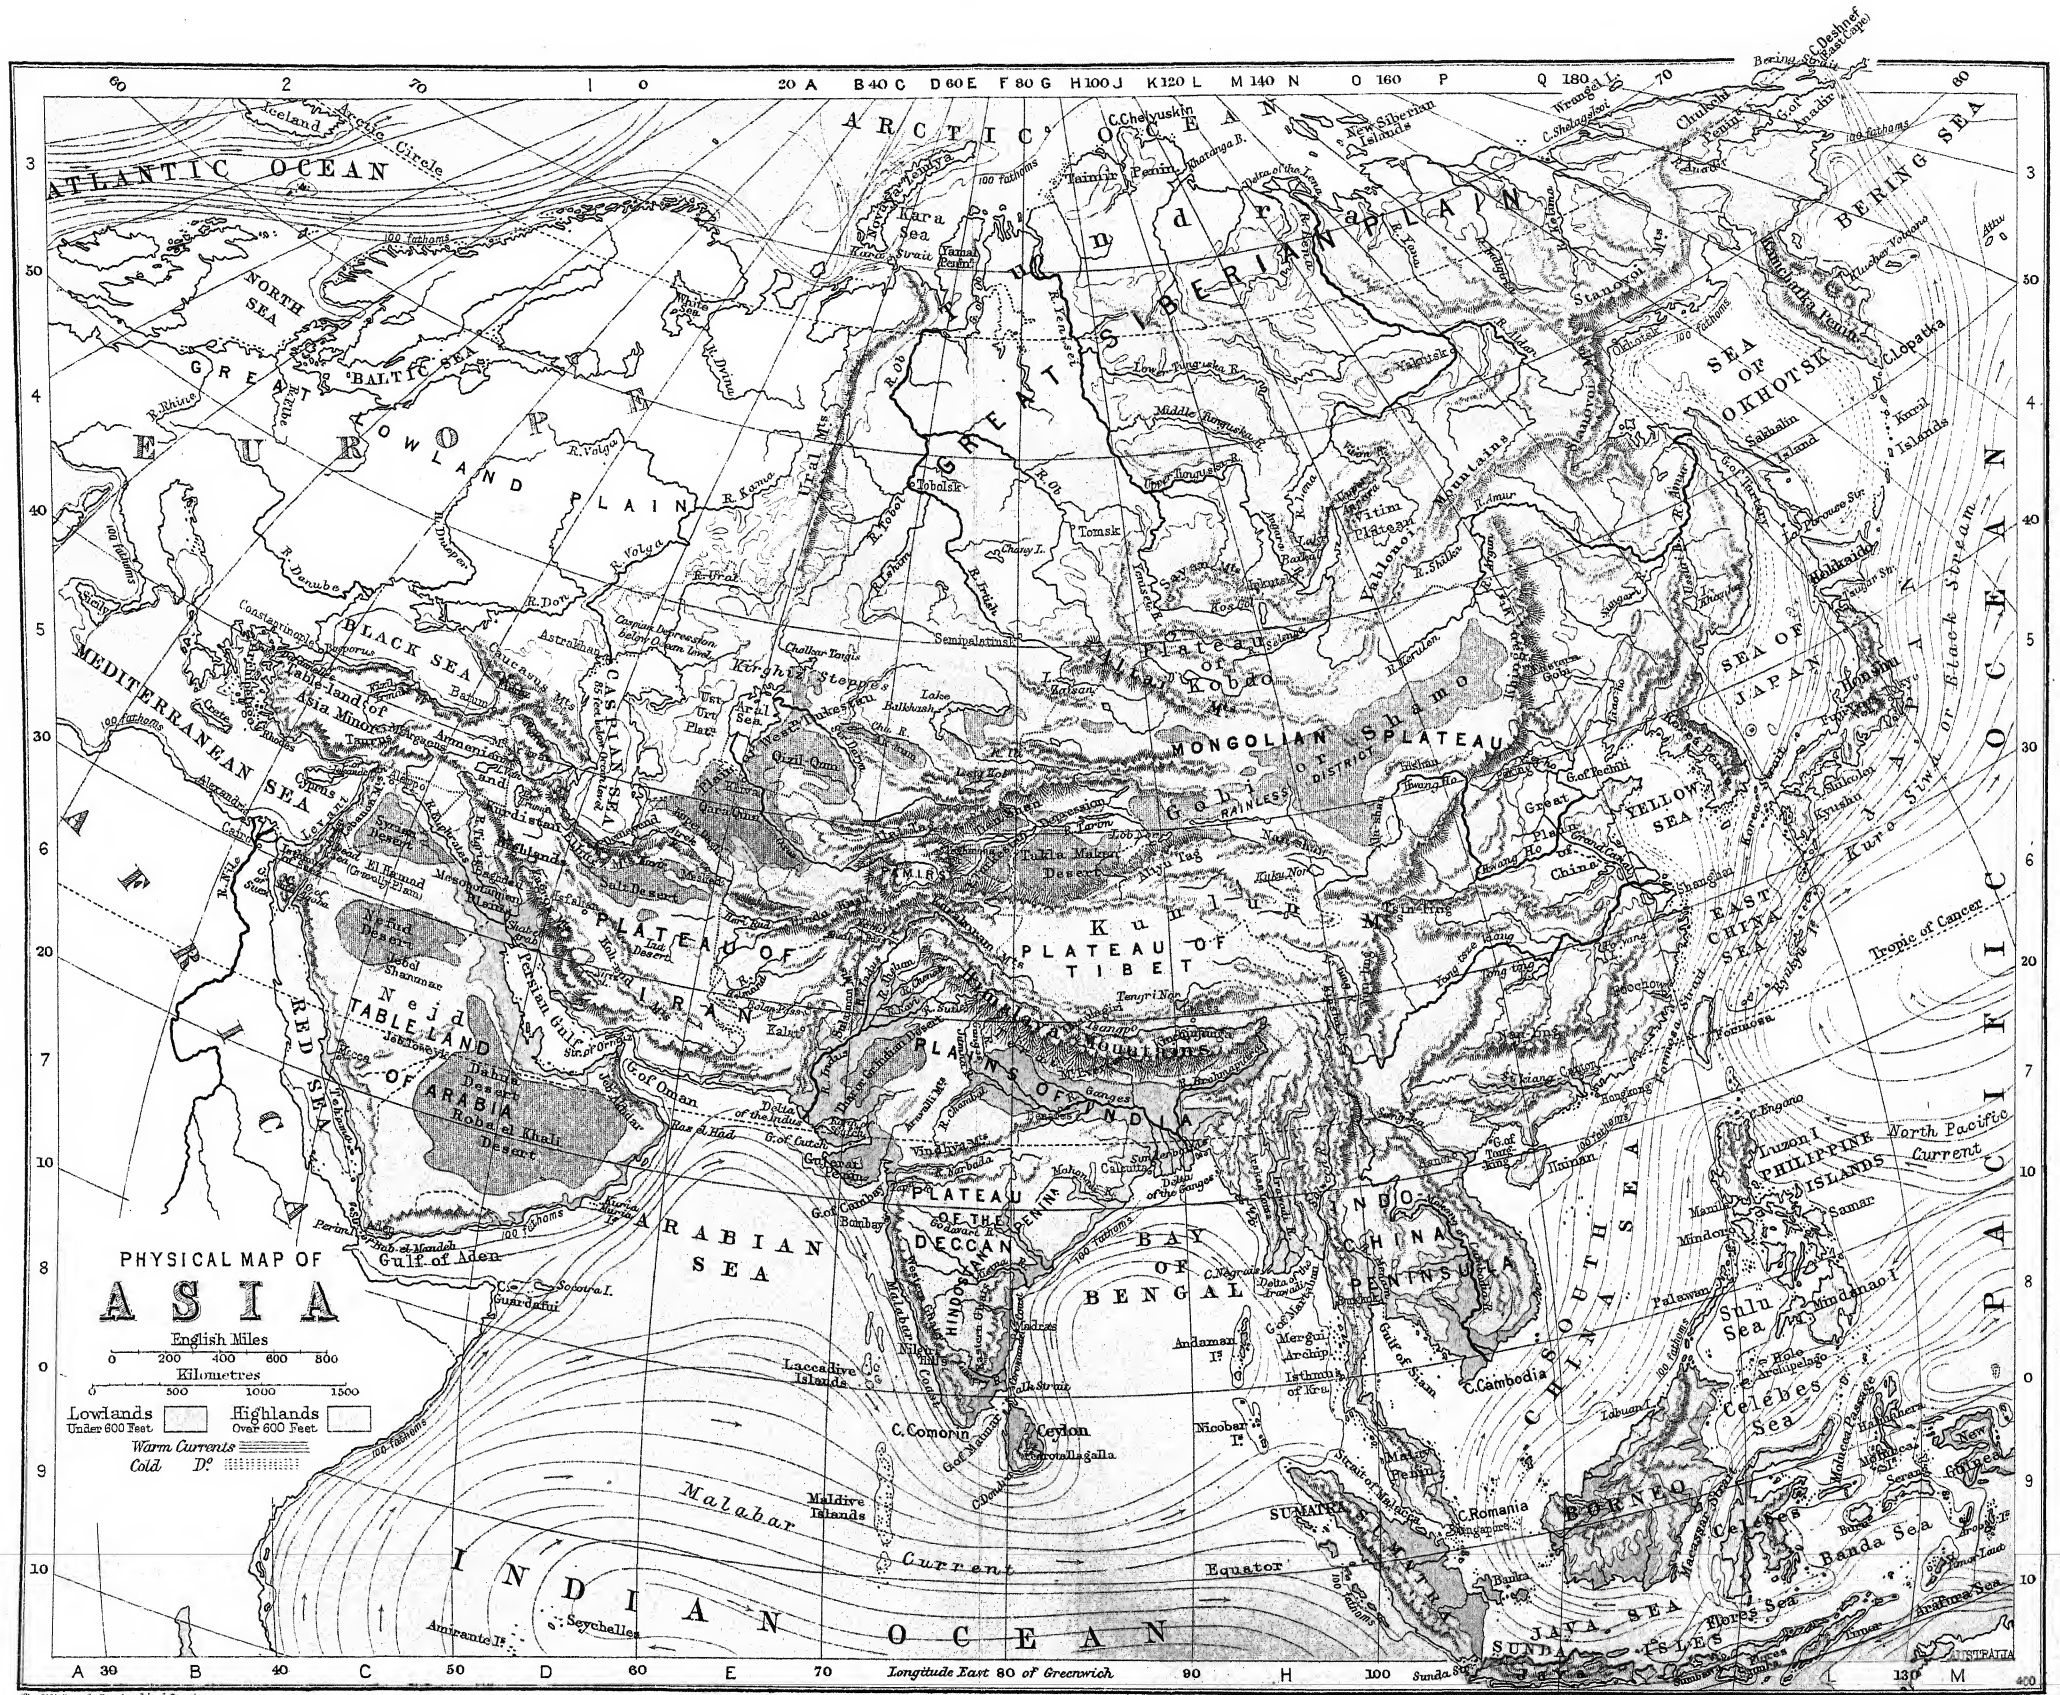

is the coldest known spot in the whole world; each wind, whatever its direction, brings to it a warmer air, and its average yearly temperature is no more than 2° F., while that of January is 59° below the freezing-point of the Fahrenheit scale. See TEMPERATURE (TERRESTRIAL). (c) The Kamchatka province, receiving much more rain than the preceding, is moister and more genial. (d) The Chinese have a cold winter, and receive in the summer the periodical rains due to the monsoons; in Japan the climate is much the same, but more moderate. (e) The Central-Asian plateau is characterised by an exceedingly dry climate, with very cold winters, the cold being increased by its height above the sea-level. (f) The same exceeding dryness of climate is met with in the Aral-Caspian lowland, with its scanty rains and depressingly hot summer; and the same again is true with regard to (g) the Arabian region and Mesopotamia, which together may be considered as an eastern continuation of the Sahara. (h) The Mediterranean region, including Asia Minor, enjoys the best climate, reasonably moist, and more moderate in its extremes of temperature. (i) The valley of the Lower Indus, whose climate is dry and very hot, must be considered as a separate region; while (k) India, the Indo-Chinese Peninsula, and Australasia have a tropical climate, characterised by abundant periodical rains, especially in the summer, and a limited range of temperature. In winter Asia is abnormally cold except along the south coast, and in summer it is abnormally hot except along the east coast. South of the pole of cold, and modified by it, a pear-shaped area of very high pressure (30.5) results in winter in outflowing winds to every point of the compass (cf. the NW. monsoon of China and Japan); and similar local causes in North-west India, which is climatically isolated by the great Himalayan barrier, send a NW. monsoon over the Ganges valley. In summer a vast area of low pressure (29.7) from west of Arabia to east of the Gobi is associated with a general inflow of moist winds from all the surrounding oceans, felt even in Poland, and marked by strong monsoons in Eastern and South-eastern Asia; and within this general inflow there is a special inflow to a focus of high temperature and low pressure in North-west India, giving WSW. monsoons to the Bombay coast, and SSW. monsoons to Bengal.

Such a régime obviously involves a most unequal distribution of rain. Winter rains may be expected only where outflowing winds have passed over open sea—e.g. in Japan, Annam, Madras; and even in summer heavy rains are confined to the east of a line from Okhotsk to Lhasa and south of the Himalayas. Across the continent from west to east, between 50° N. and 60° N., there is a belt of very useful rainfall, associated with some winter snow; and both north and south of this there is a narrower belt of less rainfall; but the total annual fall for the mass of Central and South-western Asia is under 10 inches. In the monsoon region, however, no area east of the above line has a rainfall less than that of London; in the warmer latitudes and at the higher elevations large areas get from 60 to 80 inches; and special areas have excessive falls—e.g. 100 inches on the Konkan lowland and 13 yards on the Assam hills, where 25 yards has been measured.

Flora.—A single domain of vegetation stretches from Scandinavia to the Pacific, across the northern half of the Old World. Only a narrow strip of land along the shores of the Arctic Ocean, where tree vegetation is represented only by two species of dwarf willows, 2 or 3 inches high, and by shrubs of the dwarf birch, is considered as a separate region—the *tundra* region, which extends

from the White Sea to the north-eastern extremity of Asia. It is the true domain of lichens and mosses, which clothe the deeply frozen ground; but in the few sheltered places where some soil has accumulated, we find hundreds of our common European flowering plants. The remainder of Siberia is included in the European-Asiatic boreal domain. Forests cover these extensive tracts, both in the hilly districts and in the marshy lowlands of Western Siberia, and they consist of the same trees (pine, fir, larch, silver-fir, birch, aspen, and poplars) with which we are familiar in Europe. Only the red beech, which even in Middle Europe does not advance farther east than Poland, does not penetrate into Siberia; and the oak does not cross the Ural, reappearing only on the south-eastern slope of the great plateau. Generally, the differences from Europe are due to variations of species rather than of genera—e.g. of larch and fir among conifers. Nevertheless, the forests of Siberia differ widely from those of Europe in the predominance of the larch, the rarity of the Scots pine, which grows only on the drier ground, and the very characters of the trees, compelled to accommodate themselves to a harsh climate, and to a soil either stony or swampy. The underwood of the Siberian forests also offers a richer variety of species, and many a bush, now a favourite in our gardens for its wealth of blossom (*Perus baccata*, *Robinia caragana*, *Lonicera tatarica* and *cærulea*, *Clematis*, *Rhododendron*), has its home in the alpine tracts which border the great plateau on the north-west. On the meadows which cover immense areas both on the lowlands and high plains, the vegetation, as a whole, differs but slightly from that of Eastern Europe; but it has a very different appearance, on account of the immense size reached by many grasses with hard, woody stems, and the brilliancy of their showy flowers. Peonies, aconites, gentians, asters, and the like, in the spring-time impart such a brightness to the meadows of the Baraba Steppe in Western Siberia, and still more of the high plains of Minusinsk and Transbaikalia, as makes our European meadows appear exceedingly tame in comparison with those of Siberia. Corn grows freely throughout the region, except in places having a great altitude, where early frosts destroy the crops. Barley is cultivated even at Yakutsk, where it ripens rapidly during the hot summer, and under the greater amount of light received in these high latitudes. But fruit-trees, although they blossom every year, yield no fruits; the late May frosts nip their blossom.

This wide vegetation-region, which occupies all Northern Asia, is bounded on the south by a line traced roughly from the Black Sea to Lake Baikal, and thence to the Upper Amur and the Sea of Okhotsk. It has not, however, the uniformity it may be supposed to have from a glance at a geo-botanic map. While the species freely spread from west to east on the lowlands of Siberia, they spread quite as easily from south-west to north-east, both along the high plains and the alpine regions which border the high plateau in the north-west, and over the plateau itself. Therefore, even the Siberian flora is easily subdivided into several separate regions. Thus we see the cedar-tree spreading all along the highest parts of the north-west border-ridge of the high plateau, from the Altai to the Lena; we find the same vegetation on the high plateau of the Kosogol and on the Vitim; the vegetation of the high plains of the Altai offers features common to that of the high plains west of Lake Baikal; and the Transbaikalian flora partakes of the characters of the Gobi. As soon as the Amur issues from the high plateau, we find on its banks the Chinese

John Bartholomew & Son, Ltd.

W. & R. CHAMBERS, LIMITED, LONDON & EDINBURGH.

and Japanese flora under the same latitudes as the purely Siberian flora in the west. Finally, it appears from recent investigations that even about Lake Balkhash and at the foot of the Tian-shan we have remainders of a European-Siberian flora, which has maintained itself on the better-watered slopes.

The next vegetation zone marked on our maps is that of the Steppes, which extends from the Steppes of South-eastern Russia over the Aral-Caspian depression and the middle parts of the high plateaus of Western and Eastern Asia, including several separate desert-regions (the Han-hai, the Gobi, the dry interior parts of Arabia, Persia, and North-western India). This wide region ought to be divided in Central Asia alone into at least four sub-regions: the Aral-Caspian, the Tian-Shan, the Tibetan, and the Mongolian floras. The excessive dryness of climate gives to this region its characteristic aspect. Tree vegetation maintains itself only on the snow-covered mountains, which supply permanent moisture to the soil, while on the drier southern slopes, the Steppe vegetation climbs up to the limits of perennial snow. Only those bushes prosper which, like the Archa (*Juniperus pseudo-sabina*) and Saksaul (*Anabasis ammodendron*), have hardly any leaves, giving a dreary aspect to the Aral-Caspian Steppes and the base of the Tian-shan Mountains. The Steppes, the surface of the high plateau, and even (during the spring) the dry deserts, are covered with a rich carpet of nutritious grass. The 'grass' of the Steppes is reduced to a few species—*Festuca*, *Stipa*, *Artemisia*, *Sal-solaceæ*. In the dry regions of Arabia, the flora assumes a decidedly African character, owing to the presence of the gum-acacia and the date-palm.

The flora of the region to the east of the high plateau, including China, Manchuria, and Japan, must be considered as an East-Asiatic equivalent for the Mediterranean flora of Europe. Oak reappears as soon as the eastern border-ridge of the plateau is crossed. So also the walnut, the hazel, the lime-tree, the maple; while several new species of poplars, willows, and many others, make their appearance. The forests, consisting of a most mixed vegetation, where southern species meet with northern ones, become really beautiful; in Japan a variety of species of pine, and the reappearance of the beech, add to their beauty. A rich underwood of lianas (ivies, wild vines, roses, and so on) renders the forests quite impassable, especially in the littoral region, which is submitted to the influence of the monsoons. In the lower parts, rich prairies cover immense spaces; the grass vegetation becomes luxuriant; and in the virgin prairies of the Amur, man and horse are easily concealed by the stems of grasses of gigantic size. Rice and cotton are cultivated in the southern parts of the region. The gradual replacing of southern species by northern permits the separation of the Chinese flora from that of Manchuria and the Okhotsk littoral. The Chino-Japanese flora shows affinities with North American.

In Western Asia, the rich vegetation of the moister parts of Caucasus and the southern shores of the Caspian belongs to the Mediterranean flora of Europe. The beech is characteristic of the forests of this district, which besides contain all the trees of Southern Europe. The vine and several of our common fruit-trees, especially stone fruit (plum, cherry, apricot, pear), used to be regarded as belonging originally to this region. The flora of Asia Minor combines those of Southern Europe and Northern Africa, owing to its evergreen oaks, laurels, olive-trees, myrtles, oleanders, and pistachio trees, as also to its variety of bulbous plants.

Southern and South-eastern Asia, with their

numerous islands, display the richest flora, which seems quite distinct from the above, and extends as a separate domain of vegetation over India, the Indo-Chinese Peninsula, and the archipelagos, and reaches Australia (cf. the *Casuarina* in Java). The hot climate, and the great amount of the summer rains, with a relatively dry winter, contribute to the development of a rich tropical vegetation. Thanks to the abundance of moisture, the higher parts of the region, particularly the Himalayas, are clothed on their southern slopes with forests up to heights of 12,000 and 13,000 feet. The vegetation of the higher hilly tracts is very like the European. Numbers of plants growing on the Himalayan summits are common to all Arctic regions, showing thus the unity of flora of the Old World at its issue from the glacial period. Lower down, in the forest-girdle, pines, juniper, and yew-trees are quite like their European congeners. The Indian cedar or 'deodar' yields good timber—a rarity in India, but cf. *sal* and *teak*—while in the underwood rhododendrons, growing sometimes 90 feet high, at heights about 8000 feet above the sea, are noteworthy.

In the lower parts of the region, and especially the neighbourhood of the sea-coasts, the tropical vegetation reaches the variety and size of the American. Here the sugar-cane, the cotton-shrub, and the indigo had their origin. The coconut-palm and the banyan-tree are the most striking feature of the coast vegetation. Ferns reach the size of large trees. The gigantic banyan, under whose branches hundreds of men can find a shelter, the screw-pine (*Pandanus*), the indiarubber, and the red cotton trees grow in immense forests; and bamboos grow thick and high.

In Borneo, Java, and the islands of the archipelagos, the tropical vegetation is, in its broad features, the same as in India. The mountain-flora also is like that of the Himalayas; rich forests clothe the volcanoes up to their tops. The sago-palm, the bread-tree, imported from the South Sea Islands, and the tamarind, also imported, are largely cultivated, as also the coconut-palm and the sugar-palm. Orchids appear in their full variety and beauty. The swamps are covered with mangroves, or with the anomalous-looking *Nipa* or *Susa*-palm; and pepper, clove, and nearly all the spices are native to this region.

It is easy to see from the above what a variety of useful plants Asia, according to some, has given to Europe. Wheat, barley, oats, and millet may come from Western Asia; so also onions, radishes, peas, beans, spinach, and several other vegetables of our kitchen-gardens. Nearly all our fruit-trees have been assigned to the same origin, as apple, pear, plum, cherry, almond, pistachio, and mulberry-tree; the raspberry and even lucerne have perhaps been imported from Asia to Europe.

Fauna.—Nearly the whole of continental Eurasia, with *cis-Atlas* Africa, is considered as constituting a single domain—the Palearctic region; and the immensity of this zoö-geographical region is easily accounted for by the ease with which animals, especially birds, could spread over the vast monotonous plains and plateaus of Eurasia, and by the original continuity of Europe and North Africa—conditions adverse to similar community in the fishes. But this wide region can be easily subdivided—e.g. into the Arctic region, which shares its characters with Arctic regions generally; the boreal, embracing the lowlands of Western Siberia; the Daurian, in the northern parts of the great plateau; and the Central Asian. The fauna of Siberia is much like that of Eastern Europe, and would be still more like, were it not for the disappearance from Europe of several species still existing in Siberia. It is the true habitat of all

fur-bearing animals, as the bear, wolf, fox, sable, ermine, otter, beaver, common weasel, and squirrel; as also of the hare, the wild boar, the stag, the reindeer, and the elk, all belonging to the European faunas, with the addition of several species common to the Arctic fauna. In Eastern Siberia, however—i.e. in the northern parts of the high plateau—we find representatives of the fauna of Central Asia, which spread from the south-west (see SIBERIA). A further addition of Mongolian species is found on the lower plateau in Transbaikalia, where the fauna of the Central-Asian depression meets with that of Siberia.

The Central-Asian plateau has a fauna of its own; we find there the wild ancestors of several of our domestic animals—viz. the wild horse (*Equus Przewalski*), discovered by Przewalski (Prejevalsky) in the Ala-shan Mountains, the wild camel and donkey, and the *Capra wargurgus*, from which our common goat is descended. The yak, several species of antelopes, and the roebuck are characteristic of the Central-Asian fauna; so also are the huge sheep (*Ovis argali* and *Ovis polii*), now disappearing, which found refuge in the wilder parts of the plateaus. In the Steppe region we find the same fauna as in Siberia, with the addition of the tiger, which occasionally reaches Lake Zaisan, and even Lake Baikal, though India is its true home. The extreme south-west, from Arabia to Sind, comes with Africa, south of the Atlas, into Sclater's Ethiopian region; cf. the lion.

The fauna of mammals in China, Manchuria, and Japan differs but little from the Siberian. The difference is mainly notable with regard to the birds, among which the pheasants are richly represented. Several Indian species also penetrate within this region. The Caucasus has a fauna belonging to the Circum-Mediterranean region, and it is worthy of notice that the bison, which has now completely disappeared from Europe (with the exception of the Byelovyesh forests in Western Russia), is still found in the forests of Caucasus; there we find also the same abundance of pheasants as on the Pacific littoral. The fauna of Asia Minor unquestionably belongs to the Circum-Mediterranean region, and includes representatives of the warm zone—viz. small apes, which spread from Africa into Persia, the porcupine of Southern Europe, and the Genet (q.v.).

Southern and South-eastern Asia belong to a separate 'Indian' domain. The heights of the Himalayas have the fauna of the Tibet portion of the high plateau; but on their southern slopes the fauna is purely Indian and Transgangeitic, though a few African species are found on the plains of India and in the Deccan. As a whole, the tropical fauna of Asia is richer than the African, and the American tropical fauna surpasses it only in the number of parrots and the family of Picariæ. It is characterised by the great number of carnivora, which find ready refuge in the jungles, and by the elephant, rhinoceros, wild buffalo, red deer, many long-armed apes and half-apes, vampires, genets, and a variety of serpents and crocodiles; while the bird fauna includes nearly every order, and has many peculiar genera. East of Wallace's Line the fauna is 'Australian'; in Bali there were no opossums or cockatoos, and in Lombok there were no monkeys or woodpeckers.

The fauna of Asia, as of Europe, has undergone notable changes since the glacial period. The mammoth and hairy rhinoceros have disappeared, and their skeletons are buried in innumerable quantities in the great glacial deposits. So also the cave-bear, tiger, wolf, and hyena. Even within historic times, several species of mammals, like the bison and the aurochs, have all but disappeared, while others are found only in

very small numbers in the wildest parts of the high plateau.

Ethnography.—The aggregate population of Asia is estimated at 975 millions, being thus more than one-half of the entire population of the globe. In comparison with the total area of Asia, this population is nevertheless small, giving only an average of 55 inhabitants per sq. m. It is, however, very unequally distributed, varying with the rainfall, the density in the monsoon area being prodigious. In India, over an area of c. 1,800,000 sq. m., it averages nearly 180 per sq. m., reaching over 500 in Oudh. In China, over an area of c. 1,500,000 sq. m., it averages 265 per sq. m., and reaches over 500 in Fukien, Honan, and Hupeh; while in Shantung it exceeds 700. On the contrary, seven-tenths of the continent have scarcely more than from 3 to 20 inhabitants per sq. m.; and nearly one-tenth is almost quite uninhabited.

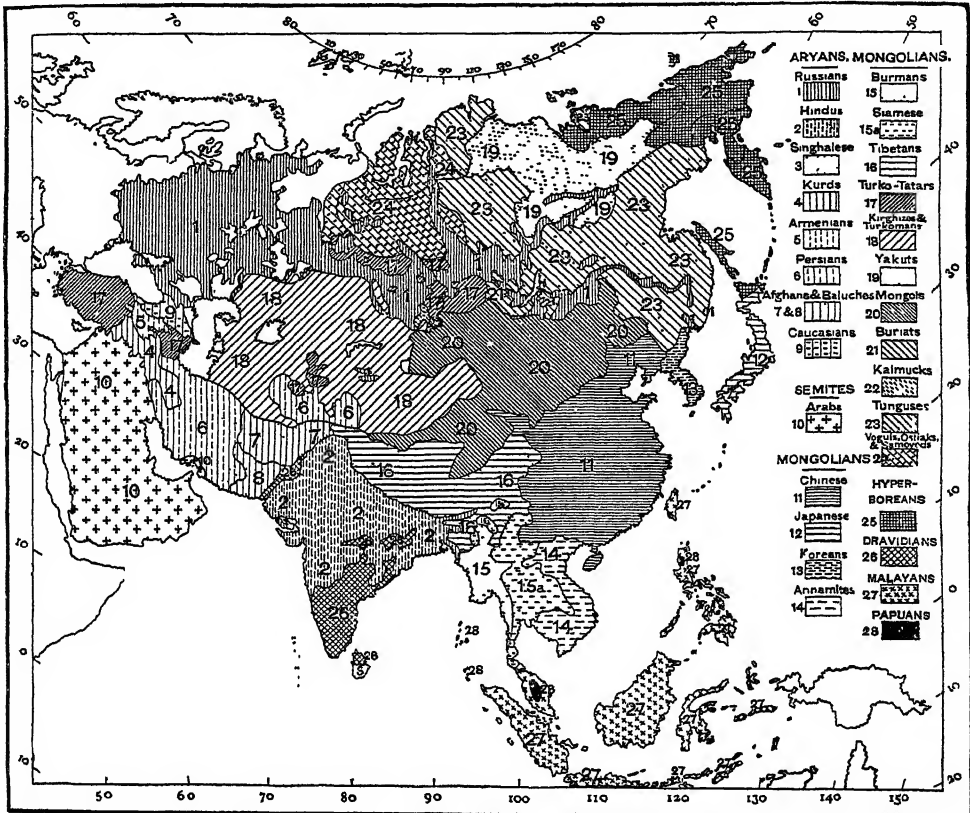

Having been inhabited by man since the earliest period of the stone age, and having been moreover the theatre of so many migrations, Asia has but few human races free from mixture with other races. Nevertheless, the hindrance to mutual intercourse opposed by its mountains, and still more by its high plateaus and deserts, prevented the mingling of races and stems to such an extent as in Europe; therefore we find now in Asia the greatest variety of ethnological types and languages. And distinct stems in the less accessible tracts, numbering now but a few families, are sometimes the last remainders of great races. Asia is essentially the home of the Mongol type, so widely distributed as to be divided into Northern and Southern secondary races. It had its area of characterisation on the central and eastern plateaus, while a somewhat similar round-headed 'Alpine' type arose on the western plateaus. The northern lowlands were occupied by a relatively fair, long-headed 'Proto-Nordic' (Haddon) type, and the Turki of the Altai and the Finno-Ugrians from the Upper Yenisei probably represent intermarriage of Proto-Nordic and Alpine types. The southern lowlands were occupied by a dark, long-headed 'Proto-Aryan' or 'Melano-Indian' (Deniker) type, represented by the Dravidas, who were flanked by maritime Indonesians of the monsoon islands and coastlands. The dry heat of the western interior gave the Assyroid and Arab type, and Indo-Afghans occupied the eastern part of this dry interior and the western part of the monsoon interior. The west-central area of the continent seems to have been the home of a family of Aryan languages, obviously akin to Sanskrit and Zend (of which we have the archaic forms preserved), and at least equally akin to Lithuanian and some other European languages (of which we have no archaic forms preserved). Meyer believes that these Aryan-speaking people did not disperse from the Turan basin till c. 2000 B.C. Some of them certainly introduced the horse into Babylon c. 1900 B.C., and others seized the pasture-lands of the Punjab c. 1700 B.C. It is inconceivable to a geographer that the 'Aryan' home was in an area showing such extraordinary poverty of native flora and native fauna as Scandinavia (Penka).

In further subdivision according to language: The Caucasian race embraces (1) tribes and stems in Caucasus (Georgians, Lezghians, Circassians, &c.); (2) the Semitic branch, partly mixed with others, and subdivided into northern and southern; it comprises the Jews and the Arabs; and (3) the Indo-Aryan branch, containing (a) the Indians, whose language has, besides the Hindi, spoken in Central India, several dialects spoken in Kashmir and Punjab, the Hindustani or Urdu, the Sindhi, the Marathi, the Bengali, and Assami; and (b) the Iranians (Persians, Tajiks, and Zendo-Afghans,

Kurds, Armenians, and Ossetians). To these must be added the Russians and other Europeans.

The Mongolian race embraces three great linguistic families: (1) the Mongolo-Turki (Ural-Altaic) of the great lowland, in which Japanese and Korean stand apart, but all the rest—from Finland to Manchuria, and from the Yakuts to the Kirghizes—are typically agglutinating, with shifting postfixes; (2) the Tibeto-Indo-Chinese, of the great plateau and its monsoon edge, in which phonetic decay has reduced an originally agglutinating order into typically monosyllabic languages, toned and isolating; and (3) the untuned, but more or less agglutinating 'Oceanic' family of the Malayo-Polynesia area.

The mass of Northern Asia—steppe, taiga, and tundra—is occupied by Mongolo-Turki or 'Mongolo-Tatar' peoples, except for the Palaesiatians or Hyperboreans of the extreme north-east (Eskimo, Tchukchi, Koriak, Yukaghir, Ainu), and the Russians who have spread along the Trans-Siberian line. The Tunguses north of the Amur, e.g. the Lamuts, have their Mongol type modified by the Hyperboreans; those south of the Amur, e.g. the Manchus, are being absorbed by the Chinese. The Yakuts are the northern representatives of the old Altaian-Turki stock, as the Samoyeds are of the old Yeniseian Finno-Ugrian stock, while the Kirghiz-Kazaks (Cossacks, 'Riders') represent the western movement of the Turkis. The name Tatar is

Ethnographical Map of Asia.

wrongly applied to these Turki peoples, for the real Tatar were pure Mongolians (easterns), and the Turkis have been so much modified by long contact with (western) Caucasian peoples that they remain distinctively Mongol only in their Ural-Altaic speech—e.g. the Magyars and Finns.

The Dravidian race, which formerly peopled all India, is now reduced to the mountain tracts of the interior and to Southern India, and is represented by (1) the Dravidas proper, including the Tamuls, Telingas, Canarese, and other smaller stems; (2) the Kolarian tribes; and (3) the Singalese, whose language—the Elu—must be considered, however, as quite separate.

The Negritos and Papuans are now found only in the less accessible forests of the interior of Malacca, and on the Philippine and Andaman Islands.

Religions.—Since the dawn of history, Asia has been the birthplace of religions which spread all over the continent and the other parts of the world. The four great religions which are professed by the great majority of mankind—the Jewish, Buddhist, Christian, and Mohammedan—had their origin in Asia, where they grew up under the influence of still older religions—the Babylonian and that of Zoroaster—both also of Asiatic origin. Multitudes of new sects, or religions, mingled together, and exercising influence upon one another, are continually growing on the soil of Asia. At present the inhabitants of Asia belong chiefly to the Buddhist religion, which—inclusive of the followers of Lamaism, the moral philosophy of Confucius, and the teachings of Lao-tse, who all accept more or less the Buddhist ritual—has probably

from 500 to 560 millions of followers—i.e. nearly one-third of mankind. The old faith of Hinduism has no less than 217 millions of followers in India. Most of the inhabitants of Western Asia, as also of part of Central Asia, follow the religion of Islam; they may number about 80 millions. The Christians number nearly 29 millions in Armenia, Russian Asia, and India. Many of the Ural-Altaians continue to maintain their ancient faith—Shamanism—though a number of them are nominal followers of the Buddhist or the Christian religion. Jews are scattered mostly in Western and Central Asia. A few fire-worshippers—Guebres or Parsi—in the west of India and Persia, are the sole remnant of the once widespread religion of Zoroaster; while vestiges of Sabæism are found amidst the Gesides and Sabians on the Tigris.

Civilisation.—Together with Egypt, Asia contributed greatly to the present European civilisation; but, owing to many circumstances, partly physical and partly historical, the development of Asia proceeded on independent lines, and, as a whole, it may be considered as behind the civilisation of Europe. The current of civilisation, which formerly moved from Asia to Europe, returns now from west to east—unhappily, too often in its worst shape, that of conquest. Many a civilisation which grew up, either in South-western Asia or on the northern slope of the great plateau, has been swept away by invasions of less civilised half-nomads. At present one finds in Asia all varieties of civilisation—the primitive tribes of North-eastern Siberia, the confederations of nomadic shepherds, and great nations in possession of a common stock of national customs, beliefs, and literature, like China; the tribal stage; the ‘compound family,’ forming the real basis of China’s social organisation; the rural community, both of the Indian (also East European) and Mussulman type; the loose aggregations of Teluktelis, having no rulers, and no religion beyond the worship of forces of nature, but professing with regard to one another principles of morality and mutual support often forgotten in higher stages of civilisation; and (till of late) despotic monarchies, with a powerful clergy. So also in economic life. While the tribes of the north-east find their means of subsistence exclusively in fishing and hunting with the simplest implements, among which stone weapons have not yet quite disappeared, and the tribes of Central Asia carry on primitive cattle-breeding and lead a half-nomadic life, others are agriculturists, and have brought irrigation (in Turkestan) to a degree of perfection hardly known in Europe.

Political Conditions.—Viewed in its broad features, universal history appears as a long record of the mutual intercourse of Asia and Europe, and of struggle between them. While the countries beyond the great plateau entered but quite recently within the domain of western history, those on its Mediterranean slope have never ceased to exercise a powerful influence on Europe. At the very dawn of written history—that is, forty centuries before our era—the great Akkadian empire already influenced the inhabitants of the coast of the Mediterranean. Later on the Phœnicians extended their authority over Northern Africa and the Ægean Sea; the Persians modified the development of Egypt; and at a very remote epoch, the date of which cannot be yet ascertained, an oasis of high civilisation, grown up at the base of the Altai Mountains, spread itself to the west over Northern Europe. On the other hand, as soon as Greece, which had borrowed so much from Asia, brought her civilisation to such a pitch as to become the cradle of European culture, she tried to extend her rule over the decaying empires of Western Asia. Alexander of Macedon pushed his conquests as far

as Turkestan; and later on Rome conquered Western Asia. But the Greek and Arabian civilisation in Central Asia decayed under the raids of Mongolian tribes; the Roman empire was absorbed by the East, and fell into decay at the very confines of Asia, on the shores of the Bosphorus; the Arsacides and Sassanides of Persia repulsed the Roman aggression and conquered Roman provinces, while it was to mass movements from Asia into Europe that the great migrations of the first centuries of our era were due. Ural-Altaians migrated to the Urals, and thence to Hungary. Other Turanians—the Mervs, the Alans, the Avars—penetrated into Europe from the south-east; Mongols abandoned their rapidly desiccating plateaus, and invaded the Russian plains; the Arabs, following the south coast of the Mediterranean, invaded Spain; and the empire of the Osmanlis arose on the ruins of the Eastern Roman empire. By these invasions Asia arrested the free development of Europe, and compelled the Germanic, Gallic, and Slavonic federations to gather into powerful states of the Roman monarchical type.

A new epoch in European history began after the development of European navigation, when Portuguese ships, rounding the Cape, founded the first European colonies in India. They were soon followed by the Spaniards, the Dutch, the French, the Danes, and the British, all endeavouring to seize the richest colonies in Asia; while Russia, in the course of a few centuries, conquered and partly colonised the best parts of the immense flat prairies and forest-lands on the north-western slope of the high plateau, and crossing its narrow extremity in the north-east, reached the Pacific. Great Britain established herself in India, and expelling thence her competitors from all but a few spots on the sea-coast, still held by Portuguese and French, she took possession of the whole of the peninsula, and extended her powers over the western parts of the Indo-Chinese Peninsula. The Dutch have under their dominion most of the East India Islands. Spain lost the Philippines to the United States, and sold the Carolines and the Ladrones or Mariannes to Germany. These German islands are now under Japanese mandate. France has consolidated its power in Indo-China. China, till the war with Japan in 1894–95 regarded as the third power in Asia (after Britain and Russia), has sunk into a subordinate place; Japan is now the foremost native Asiatic power, especially since the war with Russia in 1904–5. Most European nations have, like Japan, intrigued and bullied for leases and concessions in China. Turkey, since the Great War almost a purely Asiatic state, has lost much even in Asia; Arab states have become independent or been placed under French and British mandates.

Produce.—The amount of cereals—rice, millet, wheat, barley, oats, &c.—supplied by the rich corn-fields of China, Indo-China, Japan, and even Turkestan, may be best judged by the density of population in the better-watered parts of these countries, and by the rapidly increasing amounts of grain exported, especially from India; while in Southern Siberia, the Altai, and the Middle Amur, Russian settlers raising wheat, rye, oats, barley, melons, &c. on the virgin soil of the prairies have enjoyed a welfare hardly known in Russia. In the raising of cotton India stands next to the United States, while Bokhara and Transcaucasia have supported about half of the cotton industry of Russia. Tea is a very important crop in India, Southern China, and Ceylon; and coffee is important in the Dutch Indies and in India. The silkworm culture is widely spread in Asia Minor, Persia, Turkestan, India, China, and Japan. The sugar-cane is largely raised in Southern and South-

eastern Asia. Oleaginous plants, indigo and other dye plants, jute, spices, the cinchona-tree, and opium-producing plants are extensively cultivated; as also fruit-trees in Western Asia and Turkestan. The coconut-palm, the bread-tree, gutta-percha, and plantation rubber are also grown to a great extent in tropical Asia; while many of our most valuable species of timber came originally from Asia, and are still imported thence to Europe.

On the steppes and plateaus of interior Asia, numberless herds of horses, horned cattle, and sheep furnish all the necessaries of life to the nomad or half-nomad Mongolian inhabitants of these regions, and supply the European trade with a large proportion of their hides, wool, and tallow. The forests of the far north and north-east afford the means of existence to nomad hunters, who find, however, severe competitors in the Siberian (Russian) peasants. Both supply the trade with rich furs; while the rivers of Siberia and Manchuria provide food for the nomad Ostiaks, Gols, and Ghilyaks. And finally, the Behring and Okhotsk Seas of the Northern Pacific, and their islands, supply the civilised world with some of the finest furs.

Ways of Communication.—The plateaus, the deserts, and the mountainous regions of Asia, thickly clothed with impenetrable forests and intersected by deep gorges and valleys, are so many obstacles to the communication between different parts of the continent. The roads of Asia, except those of China and India, and a few main lines elsewhere, are mostly mere footpaths or tracks marked in the deserts, with wells far apart, and bleached with the bones of camels. Caravans of camels are therefore the chief means of transport for goods and travellers in the interior; donkeys, yaks, and even goats and sheep are employed in crossing the high passages of the Himalayas; horses are the usual means of transport in many parts of China and Siberia, and in the barren tracts of the north the reindeer, and still farther north the dog, are made use of. Fortunately, the great rivers of Asia provide water communication over immense distances. The deep and broad streams of China, allowing heavy boats to penetrate far into the interior of the country, connect it with the sea; a brisk traffic is carried on along these arteries. In Siberia, the bifurcated rivers supply a water-way during summer not only north and south on their lower courses towards the Arctic Ocean, but also west and east on their upper courses; thus a great line of water communication crosses Siberia, and is, with but a few interruptions, continued in the east by the Amur, navigable for more than 2000 miles. In the winter the rivers and plains of Siberia become excellent roads for sledges, on which goods are still chiefly transported.

Railways have but lately begun to make their appearance in Asia; but in India they already have a total length of about 40,000 miles. Russia, too, has spread her railways right across Asia to the shores of the Pacific. The Trans-Siberian line, fed *via* Ekaterinburg from Petrograd and *via* Zlatoust from Moscow, connects by Kharbin with Vladivostok and Fusan (for Japan), and with Hankow and Shanghai, while Turkestan is linked up to Tula *via* Tasikent and Orenburg, and *via* Merv and the Caspian. The total distance from Petrograd to Peking by the Trans-Siberian Railway is about 6000 miles—i.e. less than that from London to Bombay *via* the Suez Canal. There are railways longer or shorter in Japan, Siam, &c., the Pilgrim Line from Aleppo to Medina *via* Damascus, and the 'Baghdad' Line, being specially important. All the chief ports in the south and south-east of Asia are in regular steam communication with Europe and the United States. The northern route from Europe to Siberia, by the

Arctic Ocean and Kara Sea, is only practicable for a few weeks in the year.

Petrograd is connected by telegraph with Vladivostok, while another branch, crossing Turkestan and Mongolia, runs on to Tashkent, Peking, and Shanghai. Constantinople is connected with Bombay, Madras, Singapore, Saigon, Hong-Kong, and Nagasaki in Japan; Singapore stands in telegraphic communication with Java and Port Darwin in Australia; and Odessa is connected by wire with Tiflis in Caucasus, Teheran, and Bombay. Wireless stations have been established in many parts of Asia.

Trade.—Notwithstanding the difficulties of communication, a brisk trade is carried on between the different parts of Asia. India, China, and Japan are much the most important areas.

Hitherto Asia has supplied Europe chiefly with raw materials—gold, silver, petroleum, teak and a variety of other wood, furs, raw cotton, silk, wool, tallow, and so on; with the products of her tea, coffee, and spice plantations; and with a yearly increasing amount of wheat and other grain. Steam-industry in Asia already threatens to rival European manufacture. Indian cottons of European patterns and jute-stuffs compete with those of Lancashire and Dundee. Several of the petty trades carried on in India, China, Japan, Asia Minor, and some parts of Persia have been brought to so high a perfection that the silks, printed cottons, carpets, jewellery, and cutlery of particular districts far surpass in their artistic taste many like productions of Europe. Japan supplies Europe with thousands of small articles—applications of Japanese art and taste to objects of European household furniture.

Asia, CENTRAL. This term is often loosely applied to regions of greater or less extent in the interior of Asia, but geographers urge that the name should be strictly confined to the territory (Eastern Turkestan, Tibet, &c.) lying between the Altai Mountains on the north and the Himalayas on the south, the Pamir on the west and China Proper on the east. *Russian Central Asia* was a division of the empire outside that area—east of the Caspian Sea and round the Aral Sea and Lake Balkhash. It comprised, with part of what used to be called Siberia, Russian annexations in Turkestan. It was divided into the Steppes (provinces of Akmo-linsk, Semipalatinsk, Turgai, Uralsk) and Turkestan (provinces of Semirechensk, Sir-Daria, Amu-Daria, Samarkand, Ferghana and Transcaspia; and the vassal states of Khiva and Bokhara). In 1920–21 the Moscow government set up the Kirghiz republic (the Steppes with part of Transcaspia and Astrakhan) and the Turkestan republic, as Russian federal states; and Khorezm (Khiva) and Bokhara became independent soviet republics in alliance with Russia. See ASIA, TURKESTAN, SIBERIA, KHOKAND, &c.

Asiago, a town of north Italy, 22 miles N. of Vicenza, on a ridge, capital of the Sette Comuni (see VICENZA). It fell into the hands of the Austrians, 30th May 1916, but was recovered by the Italians a few weeks later. Pop. 2000.

Asia Minor (Asia the Less, as distinguished from Asia in the widest extent) is the name usually given to the western peninsular projection of Asia, coinciding roughly with what was left of Turkey after the Great War. The name is not very ancient; originally the Greeks seem by Asia to have meant only the western part of Asia Minor around Ephesus, but with their geographical knowledge, the scope of the name Asia gradually widened. The late Greek name for Asia Minor is Anatolia (q.v.)—*Anatolē*, 'the East', whence is formed the Turkish *Anadolı*. The eastern boundary, somewhat artificial, is a line from the Gulf

of Skanderoon to the Upper Euphrates, and thence to a point east of Trebizond. The area of the peninsula exceeds 220,000 sq. m. It constitutes the western prolongation of the high tableland of Armenia, with its border mountain-ranges. The interior consists of a great plateau, or rather series of plateaus, rising in gradation from 3500 to 4000 feet, with bare steppes, salt plains, marshes and lakes; the structure is volcanic, and there are several conical mountains, one of which, the Ergish-dagh (Argæus), with two craters, attains a height of 11,830 feet, towering above the plain of Kaisarieh, which has itself an elevation of between 2000 and 3000 feet. The plateau is bordered on the north by a long train of parallel mountains, 4000 to 6000 feet high, and cut up into groups by cross valleys. These mountains sink abruptly down on their north side to a narrow strip of coast; their slopes towards the interior are gentler and bare of wood. Similar is the character of the border ranges on the south, the ancient Taurus, only that they are more continuous and higher, being to the north of the Bay of Skanderoon 10,000 to 12,000 feet, and farther to the west 8000 to 9000 feet. The west border is intersected by numerous valleys opening upon the Archipelago, to the northern part of which Mounts Ida and Olympus belong. Between the highlands and the sea lie the fertile coast-lands of the Levant. Of the rivers the largest is the Kizil Irmak (Halys), which, like the Yeshil Irmak (Iris) and the Sakaria (Sangarius), flows into the Black Sea; the Sarabat (Hermus) and Meinder (Mæander) flow into the *Ægean*. See *ASIA*.

The *climate* has on the whole a south-European character; but a distinction must be made of four regions. The central plateau, nearly destitute of wood and water, has a hot climate in summer, and a cold in winter; the south coast has mild winters and scorching summers; while on the coast of the *Ægean* there is the mildest of climates, with a magnificent vegetation. On the north side the climate is not so mild, but the vegetation is most luxuriant.

In point of natural history, Asia Minor forms the transition from the continental character of the East to the maritime character of the West. The forest-trees and cultivated plants of Europe are seen mingled with the forms characteristic of Persia and Syria. The central plateau, which is barren, has the character of an Asiatic steppe, more adapted for the flocks and herds of nomadic tribes than for agriculture; while the coasts, rich in all European products, fine fruits, olives, wine, and silk, have quite the character of the south of Europe, which on the warmer and drier south coast shades into that of Africa.

The inhabitants, some 10,000,000 in number, consist of the most various peoples. The Osmanli Turks, who number about 1,200,000, are spread over the whole country; allied to these are the Turkomans and Yuruks, speaking a dialect of the same language. The latter are found chiefly on the tableland, leading a nomadic life; there are also hordes of nomadic Kurds. Among the mountains east of Trebizond are the robber tribes of the *Lazes*.

The Greeks and Armenians are the most progressive elements in the population, and have most of the trade; while the Greeks monopolise the professions, the ownership of the land is largely passing into the hands of Greeks, Armenians, and Jews. Before the curtailment of Turkey the country fell into eight vilayets or governments, with their capitals in Brusa, Smyrna, Konieh (Iconium), Adana, Sivas, Angora, Trebizond, and Kastamuni respectively. In ancient times the divisions were Pontus, Paphlagonia, Bithynia, in the north;

Mysia, Lydia, Caria, in the west; Pisidia with Pamphylia, and Cappadocia, in the south; and Galatia with Lycaonia, and Phrygia, in the centre. Many of the *Ægean* islands belong geographically to Asia Minor.

Here, especially in Ionia, was the early seat of Greek civilisation, and here were the countries of Phrygia, Lycia, Caria, Paphlagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, &c., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2000 years B.C.) to the time of Osman (about 1300 A.D.), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with Mithridates and the Parthians; of the Arabs, Seljuks, Mongols, and Osmanli Turks with the Byzantine empire. Under the Turks the country sank into lamentable decay. Two railways start from Smyrna; the Anatolian railway runs from the Bosphorus to Konieh (640 miles); thence German financiers, in spite of political difficulties and national jealousies, perfected (from 1903) a scheme for continuing this line to Bagdad and the Persian Gulf—a scheme which Britain brought to its consummation.

See Kinglake's *Æthen* (1844), and works by W. J. Hamilton (1840), Burnaby (1877), Mrs Stevenson (1881), Cochran (1887), Sir W. M. Ramsay (1890-1917), Hogarth (1896-1910); and the map at *ROMAN EMPIRE*.

Asiatic Society, ROYAL, was founded in London in 1823 for the investigation of arts, science, and literature in relation to Asia, and incorporated societies in Bombay, Madras, Ceylon, and Hong-kong. The society publishes a valuable *Journal*, and has promoted many valuable books and translations. The Asiatic Society of Bengal had been founded in 1784. The Dutch Colonial Society in Java dates from 1779, the German Oriental Society from 1845, two French societies from 1821 and 1842 respectively, and the American one at Boston from 1842. Japan has an important cognate society at Tokio.

Asinius. See *POLLIO*.

Asio. See *OWL*.

Asir, an Arabian imamate on the Red Sea, between Yemen and Hejaz. The capital is Sabiya. The hinterland is under tribal chiefs.

Asirgarh (also *Aseerghaur*), a strong fortress in the Nimar division of the Central Provinces. It stands on an isolated mountain of the Satpura range, 850 feet above the base and 2283 above the sea; twice taken by the British—in 1803 and 1819.

Askabad, political centre of Trans-Caspia, in the Turkistan republic of 1921, on the Trans-Caspian Railway, 290 miles S.E. of Mikhailovsk, the seaward terminus, and 232 W.N.W. of Merv. It was occupied by the Russians in 1881.

Aske, ROBERT. See *PILGRIMAGE OF GRACE*.

Åskerc, ANTON (1856-1912), a Slovene poet, wrote ballads and romances.

Askew, ANNE, Protestant martyr, was born of gentle parentage near Grimsby, Lincolnshire, in 1521. Early embracing the views of the Reformers, she was turned out of doors by her husband, a zealous Roman Catholic. On this she went up to London to sue for a separation; but in 1545 she was arrested on a charge of heresy, and was examined by the Bishop of London and others on the doctrine of transubstantiation. After further examination and torture by the rack, she was burned at the stake, in Smithfield, July 13, 1546.

Askja (Ice, 'basket'), the largest volcano in Iceland, rises out of the vast Odáthahraun lava-desert, near the centre of the island, in 65° N. lat. and 16° 45' W. long. Its vast crater is over 23 sq. m. in area, and about 17 miles in circumference. Almost circular in shape, it lies at a depth of over 700 feet within a mountain built up, by a distinctly marked series of lava-flows, round a volcanic vent, to a height of 4633 feet above the sea. Great volumes of steam are belched forth from numerous rifts and vents, and the whole surface is a chaos of rugged lava-floods, except in the SE., where there is a hot-water lake 5 miles in circumference, and a tract covered with pumice ejected in 1875. This great eruption first called general attention to Askja, and it has been stated that the volcano was only then formed; but the traces of innumerable earlier eruptions are found in the walls of the crater, already referred to, where the divisions are marked by the layers of red, slag-like lava, which time after time has formed the surface of the underlying lava-strata. Most of the lava in this eruption found an outlet, not from the crater, but some miles to the NE., where a bed, 20 miles long and 7 broad, now lies.

Asklepios. See *ÆSCULAPIUS*.

Asmode'us, or **ASMO'DEUS** (Heb. *Aschmedai*, 'the destroyer'), a demon mentioned in the later Jewish writings. In the Book of Tobit, he is described as loving Sara, daughter of Raguel, and as having, in the form of a succubus, destroyed in succession her seven husbands; hence, in modern times, he is jocularly spoken of as the destroying demon of matrimonial happiness. In the Talmud, Asmodeus is described as the prince of demons, and is said to have driven Solomon from his kingdom. His real origin may perhaps be traced to the *Æshma daeva*, one of the evil demons of the ancient Persian religion. Le Sage has given him a permanent place in literature by his novel, *Le Diable Boiteux*.

Asmonæ'ans. See *MACCABEES*.

Aso'ca (*Jonesia asoca*), an Indian tree of the natural order Leguminosæ, sub-order Cæsalpinosæ, remarkable for the beauty of its red and orange flowers. The leaves are abruptly pinnate, shining, and very beautiful. The asoca is often mentioned in Indian poetry, and is connected also in various ways with the Hindu mythology.

Asoka, an Indian king, has been called the 'Buddhist Constantine,' having organised Buddhism as the state religion. He was the grandson of Chandragupta or Sandrocottus (q.v.). He began to reign in 264 B.C. As king of Magadha, or Behar, Asoka became a zealous convert to Buddhism about 257 B.C., and in 244 he convened the third of the great Buddhist councils at Patna. Throughout his kingdom and the conquered provinces he published the grand principles of the faith; and the fourteen edicts by which these sermons were preached are still found graven deep on pillars, caves, and rocks from Peshawar and Kathiawar to Orissa, in the Indo-Bactrian character (see *ALPHABET*). His civil organisation and administration of justice were also admirable. He died about 223 B.C. See Vincent A. Smith, *Asoka, the Buddhist Emperor* (1901; rewritten and enlarged 1921); Rhys Davids, *Buddhist India* (1903); and *INDIA*.

As'olo, an ancient walled and turreted city of Venetia, commanding from the hills a noble view over the plains to Venice, 35 miles to the SE.; it has memories of Caterina Cornaro, queen of Cyprus, of Canova, and of Robert Browning, who celebrates the place in his *Asolando*. Pop. 1000.

Asp (Gr. *Aspis*), a name loosely applied (1) to the *Vipera Aspis* of Southern Europe, and other species of *Vipera*. (2) Cleopatra's asp, to which allu-

sion is so often made, was most probably the small *Vipera hasselquistii* or horned viper. (3) It is equally impossible and unnecessary to determine with certainty the exact significance of the biblical word 'asp.' Several species of vipers occur in Palestine, but the context would in some cases suggest the Egyptian juggler's snake, *Naja haje*. (4) Another form, which is nearly allied to the Indian cobra da capello (*Naja tripudians*), is, like the latter, very venomous, and has also the habit of dilating the loose skin of its neck. It has been long known, and seems to be often referred to under the titles *aspis*, *aspic*, and *asp*.

Aspar'agine, $C_4H_9NH_2 \begin{Bmatrix} CONH \\ COOH \end{Bmatrix} + 2H_2O$, is a crystalline substance which exists ready formed in common asparagus, marsh-mallow, potatoes, chest-nuts, liquorice-root, and the young shoots of peas, beans, &c. It is readily obtained from the expressed juice of the young shoots of asparagus, which, after filtration and evaporation to a syrup, soon deposits it in crystalline prisms of a right rhombic form. These crystals dissolve freely in boiling water, the cooled solution having a mawkish and cooling taste, and a slight acid reaction. From a chemical point of view, asparagine is regarded as the Amide (q.v.) of aspartic acid, and forms compounds with acids and alkalies.

Asparagus, a genus of Liliaceæ; it contains sixty to seventy species, usually herbaceous, but sometimes shrubby or climbing; the stem is unarmed in some, in others thorny; the young shoots covered with leaf-scales, afterwards very much branched, with numerous fasciculate, generally bristle-like 'leaves,' which are really abortive branches or flower-stalks, the true leaves being

Asparagus :

a, upper end of a stem, showing leaves, &c.; *b*, young shoot.

reduced to minute scales. The most widely diffused species is the Common Asparagus (*A. officinalis*), a native of Europe, which grows on the banks of rivers and on the sea-shore, in meadows and bushy places, especially in sandy soils, occurring wild in a few places in Britain, and which is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, form a much esteemed article of food, which, however, is only in a slight degree nutritious. These sprouts contain a peculiar crystalline substance, called *Asparagine*, and have a specific action on the urinary organs, so that their long-continued use in very large quantities is apt even

to produce bloody urine. They are no longer retained in the pharmacopœia, but both the shoots and the roots of asparagus are still occasionally used as a diuretic in dropsies, and as a lithic to dissolve urinary calculi. For these purposes, the root is preferred, and is administered in the form of an infusion or decoction.—The thick and tender kinds of asparagus are most esteemed for the table. By cultivation it is much increased in size, and considerably altered in general appearance. In its wild state it is seldom more than a foot high, and not much thicker than a goose-quill; whereas it can be obtained in gardens more than half an inch in diameter, while its stems may rise to the height of four or five feet. Asparagus was a favourite vegetable of the ancient Romans. It is raised from seed, and grows best in a rich, fresh, sandy soil. The seed is generally sown in spring, either in the prepared bed, or in drills, from which the shoots may be transplanted when one year old. In England, it is generally planted in rows, at distances varying from 1 foot to 2½ feet, in beds that have been previously prepared by deep trenching (usually 2½ to 3 feet) and rich manuring. The shoots should not be cut till the second year after planting, and then very sparingly at first. Litter or vegetable mould is spread over the bed in autumn. It is allowed to occupy the same ground for many years; well-made beds continuing in a good bearing condition for twenty years or more. Asparagus is grown more extensively in France, where large quantities are raised among the vines. The French method differs chiefly in the substitution of more surface manuring for the English practice of preparing and enriching the bottoms of the beds.—The seeds have been used as a substitute for coffee, and a kind of spirit has been made from the fermented berries. The young shoots of several other species are also eaten, as those of *A. tenuifolius*, *A. acutifolius*, and *A. albus*, natives of the south of Europe; the last of which is used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the Bitter Asparagus (*A. scaber*), which is very similar to the Common Asparagus, are uneatable for bitterness. See C. Lott, *The Book of the Asparagus* (1899).

Asparagus Stone. See APATITE.

Aspas'ia, one of the most remarkable women of antiquity, was born at Miletus. The circumstance that in Athens marriage with foreign women was illegal, has originated the erroneous notion that Aspasia was a courtesan. She certainly broke through the restraint which confined Athenian matrons to the seclusion of their own homes; for after her union with Pericles, who had parted from his first wife by mutual consent, her house became the rendezvous of all the learned and distinguished people in Athens. Socrates often visited her. Her beauty, varied accomplishments, and political insight were extraordinarily great. From the comic writers and others she received much injustice. Hermippus, the comic poet, took advantage of a temporary irritation of the Athenians against Pericles, to accuse Aspasia of impiety; but the eloquence of the great statesman procured her acquittal. Her influence over Pericles must have been singularly great, and was often caricatured—Aristophanes ascribing to her both the Samian and the Peloponnesian war, the latter on account of the robbery of a favourite maid of hers. Plutarch vindicates her against such accusations. Her son by Pericles was allowed to assume his father's name. After the death of Pericles (429 B.C.), Aspasia formed a union with Lysicles, a wealthy cattle-dealer, who, through her influence, became an eminent man in Athens.

Aspatria, a township and urban district of Cumberland, 20 miles SW. of Carlisle, having an agricultural college; pop. 3500

Aspe, a valley (once a republic) in the Western Pyrenees, close to the Spanish frontier.—ASPE is also a Spanish town, 20 miles W. of Alicante, with a trade in fruit and wine; pop. 10,000.

Aspects, in Astronomy, are certain positions of planets with respect to one another, as seen from the earth. In the days of astrology, there were five Aspects—Conjunction (indicated by the symbol ☿), Sextile (*), Quartile (□), Trine (Δ), Opposition (♌). Two planets are in conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile, when the distance is 90°; trine, when it is 120°; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these aspects great influence over the fate of individuals and of nations. The only two of the terms now in use are *conjunction* and *opposition*. These, the former especially, were often not reckoned as aspects.

Aspen, or TREMBLING POPLAR (*Populus tremula*; see POPLAR), a tree which grows plentifully in Europe and in Siberia. It is a native of Britain, and is frequently found in Scotland, where it is met with even at an elevation of 1500 feet above the sea. It has received the specific name *tremula*, from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind—a property for which, indeed, the aspen-leaf has become proverbial. The leaves are

Branch of Aspen (*Populus tremula*): a, catkin.

nearly orbicular, but broadly toothed, so as almost to exhibit angles. The footstalks are long, slender, and compressed, which favours the readiness of motion. It grows quickly, with a straight stem, reaching to a height of from 60 to 80, or even 100 feet. The wood is soft, porous, light, white, and smooth; it does not make good fuel, but is very fit for the turning-lathe, and especially for being made into troughs, trays, and pails; whilst in France it is used for sabots. If the stem be peeled and allowed to dry before it be cut down, the wood becomes harder, and is then capable of being used as timber for the interior of houses; and on this account the tree is of great importance in many districts, and the more so as it succeeds in any soil, although it prefers one which is moist and gravelly. The bark contains a great quantity of a bitter alkaloid, *Salicin*. The charcoal made from this tree used to be extensively used for gunpowder. The peculiar quivering of the leaves of the aspen has given origin to a wealth of legendary and literary associations with the tree. The old legend that it supplied the wood of the Cross, and has never since ceased to tremble, is even yet quoted as the cause of its ceaseless quivering. It appears to have been highly valued as a timber tree in the time of Henry V., particularly for the making of

arrows. An act of parliament was passed in that reign preventing the consumption of the *aspe* for any other purpose, under a penalty of a hundred shillings. This act was only repealed in the reign of James I. Other common trees belonging to the Aspen tribe of Poplars are the White Poplar (*P. alba*) and the Gray Poplar (*P. canescens*), both of which were introduced into Britain from the continent of Europe.

Aspergillum, a remarkable genus of boring Lamellibranch Molluscs, in which the shell has the form of an elongated cone, terminating at the lower end in a disc, pierced by numerous small tubular holes. The appearance of the disc suggests the rose of a watering-pot, and this has given rise to the popular ('Watering-pot') and technical names. The tube itself is secreted by the siphons through which the water passes in and out. The two minute valves of the young mollusc persist near the lower end of the tube. Similar rudimentary shells are exhibited by allied genera, in the family *Gastrochenidae*, and by the fossil *Teredina*, which bored the drift-wood of the London clay.

Aspergillum:
a, the disc with holes;
b, the rudimentary
valves.

Aspergillus is the name of a genus of minute fungi or Moulds (q.v.) occurring on decaying substances of various kinds. *Aspergillus* and *Aspergillum* are both late Latin words (from *aspergere*, 'to sprinkle') for the brush used in the Roman Catholic Church for sprinkling holy water on the people.

Aspern, a small village of Austria, on the left bank of the Danube, nearly opposite Vienna. It was the scene of a sanguinary battle on 21st and 22d May 1809, between the French under Napoleon and the Austrians under Archduke Charles, the French being defeated, after terrible slaughter, on the second day. The loss of the Austrians was 24,000; of the French, 30,000.

Asperula. See WOODRUFF.

Asphalt, **ASPHALTUM**, or **MINERAL PITCH**, is the name given to a compact form of bitumen, which is usually black or dark-brown in colour. When free from earthy impurities, it has a conchoidal fracture and resinous lustre. Asphalt is generally found wherever rock-oil occurs, and in such localities it is clearly produced by the drying up of the petroleum. In some places, however, it occurs in beds forming a compact rock. The Dead Sea, the district near Babylon, some of the West Indian Islands, notably the *Pitch Lake* in Trinidad, and one or two places in Venezuela, France, Switzerland, Hanover, and Dalmatia, are the best-known localities for this substance; but it is found, more or less, in many countries. Asphalt was employed by the ancient Egyptians for embalming their dead, and it was used in Babylon as mortar. Its modern applications are numerous. It is an ingredient in Japan varnish, and is used along with other materials to make waterproof roofing and flooring, linings for cisterns, and along with pasteboard material in the construction of water-pipes. It is much used to form what are called 'damp courses' in walls of buildings—that is, a layer of it, from $\frac{1}{2}$ inch to $\frac{3}{4}$ inch thick, is spread over the thickness of a wall near the ground-level, to prevent the ascent of damp. Frequently nowadays the whole internal area of a house is covered with a layer of asphalt. In cases where the wall of a house comes against a bank of earth, the whole

surface is protected from damp by a lining of this material. One or two kinds, such as those found at Seyssel in the east of France, and at Val-de-Travers in Switzerland, though called asphalts, are really bituminous limestones. The latter is known all over the world as a material for pavement. This Val-de-Travers asphalt is prepared by reducing the natural rock, which contains from 7 to 20 per cent. of bitumen, to powder, and then putting it with a small quantity of melted bitumen into a caldron. After it is fused and stirred for some time, it is run into moulds to form blocks of about 1 cwt. each. These blocks are called 'asphaltic mastic,' and the finest kinds contain 87 per cent. of carbonate of lime and 13 of bitumen. This mastic should not melt below 168° F. It has, especially since 1854, been very extensively employed in the construction of pavements. When this material is used, there is, of course, far less noise produced by the traffic on the streets than with stone. For paving purposes, the 'asphaltic mastic' is heated in portable boilers, into which, at a certain stage of the preparation, there is poured about 25 per cent. of thoroughly dried sand, gravel, or powdered limestone, which is well mixed with the liquid asphalt. The mixture is then spread on the spot prepared for it, and when cool forms a hard kind of pavement. Asphalt pavements are also formed by spreading the compound powdered in a heated condition, and solidifying it by beating with a paviour's hammer. Such a roadway is very durable and dustless.

Since the middle of the nineteenth century in Continental towns the use of asphalt for roadways and foot-pavements has become very common. In London and other parts of Great Britain, foot-pavements are still frequently made of it, but it has been but very partially used for carriage-ways. For this last purpose the moist climate of our island probably renders it more slippery than on the Continent. Pavements formed of an artificial or coal-tar asphalt have long been, to a limited extent, in use; but this material is not so suitable for the purpose as the natural asphalts. It is well to state, however, that artificial asphalt is more used for 'damp courses' than the asphalts from bituminous limestones, although the latter are much better. Of late years, an asphalt made of coal-tar pitch and a cheap mineral oil called creosote oil, has been much used for the joints of wood-pavement and causeway stones, and does very well. The pigment known as asphaltum is sometimes prepared from natural asphalt, but more frequently from the residue of distilled bituminous substances. Unfortunately, its fine transparent brown colour tempted some distinguished modern artists to use it largely. As prepared it did not dry, but flowed, forming great surface cracks, and thereby innumerable pictures have been ruined. When the volatile constituents of asphaltum are driven off by a heat of 250° C. the pigment can be safely used. See also BITUMEN.

Asphodel (*Asphodelus*), a genus of perennial herbs belonging to the order Liliaceæ. The roots are fleshy and fasciculated, the leaves linear, and the flowers are arranged in long racemes, often compound, and continue flowering during great part of winter and early spring in their native country, covering, for instance, the bleakest hillsides in Greece with enduring blossom, whence probably their association in Greek mythology, and thence throughout poetry, with the Elysian fields. The species are not very numerous, and are mostly natives of the countries around the Mediterranean Sea. The Yellow Asphodel or King's Spear (*A. luteus*) and the White Asphodel (*A. albus*) have long been known in Britain as garden-

flowers. The former has an unbranched stem 2-3 feet high, much covered by the sheathing bases of the long narrow leaves. The leaves of the latter

White Asphodel (*Asphodelus albus*).

are all radical, the flowers in branched clusters. See also BOG ASPHODEL, DAFFODIL, NARCISSUS.

Asphyxia (Gr.), literally 'pulselessness,' but usually applied to the condition resulting from the blood in the body no longer being brought into the proper relations to the atmospheric air by respiration, so as to allow a sufficiently free exchange of carbonic acid for oxygen (see RESPIRATION). Asphyxia, or suspended respiration, may result from several causes. No air, or but a scanty supply, may be admitted, as in strangulation, drowning, choking, or disease in the windpipe; the chest may be prevented from expanding either from a superincumbent weight or paralysis, as when a man breaks the upper part of his neck above the phrenic nerve, thus paralyzing the diaphragm; and again, although there may be every capacity for respiration, the air itself may be in fault, and contain too little oxygen or too much carbonic acid in proportion to other elements. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen, or impregnating it with excess of carbonic acid.

When from any of the above causes asphyxia occurs, the respiratory movements become quicker and more forcible than normal, and additional muscles are brought into action till the respiratory acts merge in general convulsions. Meanwhile consciousness has been lost; the blood, unable to circulate freely through the lungs in consequence of its imperfect oxygenation, accumulates in them, in the right side of the heart, and in the veins, and the skin becomes livid. The short convulsive stage is followed by one of comparative quiescence, in which respiratory efforts more natural in appearance are made, but become slower and weaker till

they stop altogether. The heart continues to beat feebly for a short time after all other movements have ceased.

After death the blood is very dark in colour. It remains fluid, or nearly so, and consequently gravitates very readily to the part of the body which happens to be most dependent. The right side of the heart is found distended with fluid blood, the left nearly empty. The lungs are usually, though not always, much congested.

In man death occurs in from a minute and a half to five minutes after complete deprivation of oxygen. Some persons, no doubt, as the Ceylon divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood-vessels by which they are enabled to be under water for a long time. Restoration of asphyxiated persons may be attempted with hopes of success at a very long period after apparent death. The object of all methods is of course to fill the lungs with fresh air. For a description of these, see RESPIRATION (*Artificial*).

Asphyxiants, chemical substances enclosed in shells or other projectiles, which act by producing a suffocating and poisonous effect. The French in 1851 made experiments with asphyxiating shot for naval purposes, designed to suffocate the crews between decks. Such missiles were disapproved by the Peace Conference at The Hague in 1899 (Britain and the United States dissenting). Nevertheless they were used in the Great War by Germany and the other belligerents. The Washington Conference again condemned them (1922). A similar device, the stinkpot, has been used in warfare amongst the Chinese and the pirates of the eastern seas.—In a more general sense coal-gas escaping in a house, the carbonic acid gas filling wine-vats, or liberated in coal-pits after an explosion of fire-damp, and the various products of combustion, are all asphyxiants which daily claim their victims. In manufactories, numerous instances occur of workmen venturing incautiously into tanks containing the vapours of chloroform, alcohol, aniline, petroleum, and other liquids, all of which act as asphyxiants. A striking case of asphyxiation occurred on 25th September 1886, at Craræ quarry, Loch Fyne, where seven tons of gunpowder were exploded in order to shatter an immense face of rock. A large party of excursionists, who had witnessed the grand explosion from a steamer, landed shortly afterwards, and entered the quarry. Without any warning, about forty of them were suddenly struck down by the poisonous suffocating vapours, and although soon removed to fresh air, seven of them never rallied.—There are many devices in use for extinguishing fires by means of a portable apparatus which produces an asphyxiating gas, such as carbonic acid gas. Fire-extinguishers of this kind are called asphyxiators.

Aspic (Fr.), a savoury meat-jelly, containing fish, game, hard-boiled eggs, &c.

Aspidium. See FERN (MALE).

Aspinwall, or COLÓN, a town of Panamá (q.v.), virtually, however, a colony of the United States. It is situated on the island of Manzanilla in Limon Bay, 8 miles NE. of the old Spanish port of Chagres, 47 miles NNW. of Panamá by rail, and equidistant from the great trading centres of Valparaiso and San Francisco. It forms the Atlantic extremity of the Panamá Railway (1849-55) and of the Panamá Canal (see PANAMÁ). Population, about 26,000, mostly blacks. From its commanding position as a place of transit, Aspinwall benefits by the traffic in both directions. The climate, formerly very unhealthy, has been greatly improved

by the sanitary measures for the canal zone under United States auspices. The town was presented with a statue of Columbus, after whom it is officially named Colón, from the Spanish form of the name of Columbus. The name Aspinwall it derives from a New York merchant (William H. Aspinwall, 1807-75), the originator of the Panamá Railway; the company having founded the town in 1850.

Aspirate, the sound represented by the letter *h*, as a mere *breathling*. The name aspirate is also applied to two classes of consonants.

Aspirator is an apparatus employed to draw air or other gases through bottles or other vessels. It is of great use in the examination of gases by the analytical chemist. The simplest form of the apparatus is a large vessel capable of being filled with water, having a tube with stopcock at the bottom, and a second tube with stopcock at the top. In working, the apparatus is filled with water; the tube at the top is attached to the vessels through which the gas is to be drawn; and both stopcocks being opened, the weight of the water escaping at the bottom draws in the gas through the tube at the top from the attached bottle or other vessel. The name is also given to a surgical instrument for removing fluids from the body cavities (in pleurisy, abscesses, urinary troubles) by means of a partial vacuum.

Asplenium. See FERNs.

Aspromonte, a rugged, wooded mountain in the SW. corner of Italy, near Reggio, forming the extremity of the Southern Apennines, and overlooking the Strait of Messina. The summit, Montalto (6907 feet), commands a glorious view. Here in 1862 Garibaldi (q.v.) was defeated and captured.

Aspropotamo. See ACHELOUS.

Asquith, HERBERT HENRY, 1ST EARL OF OXFORD AND ASQUITH (1925), born at Morley, Yorkshire, 12th September 1852, was educated first at the Moravian school of Fulneck, near Bradford, and from the City of London School passed to Balliol College, Oxford, where he took a first class in classics (1874), won the Craven and gained a fellowship. Called to the bar at Lincoln's Inn in 1876, he became a Q.C. in 1890; in 1886 entered parliament as a Gladstonian for the East division of Fife, and from 1892 to 1895 was Home Secretary; and in 1905-8 he was Chancellor of the Exchequer, and strenuously combated 'tariff reform.' On the resignation of Sir H. Campbell-Bannerman, he formed a ministry in which he was Prime-minister and First Lord of the Treasury. His Chancellor of the Exchequer, Mr Lloyd George, in the budget of 1909 aimed at producing an expanding revenue by duties on land values (on increment value, undeveloped land, mineral rights), increased excise duties and liquor licences, changes in income-tax, death duties, and stamps. Some provision was made for industrial development and road improvement, and what its supporters regarded as social reform was denounced by opponents as socialism. The budget passed the Commons, but was thrown out by the Lords. The General Election at the beginning of 1910 gave the government a (reduced) majority; the budget was reintroduced and passed by both Houses; and the Prime-minister introduced measures for limiting the veto of the House of Lords. The Lords should not have any power over money bills (the Speaker to decide absolutely which were money bills); and any bill three times passed in the Commons should become law, irrespective of the opposition of the Lords, when two years had elapsed after its first introduction. The death of King Edward VII. (May 1910) compelled a temporary delay, but in August the Parliament Act received the royal assent from George V. A measure for the payment of members was passed.

The government steadily opposed the referendum even on such subjects as Tariff Reform and Home Rule. A dissolution of parliament took place in November 1910, but the General Election of December 1910 left the strength of parties practically unaltered. The great measure of 1911 was National Insurance, and the government had to face a great railway strike. In 1911 the alarming colliers' strike led to the passing of a Minimum Wages Act. For his opposition to women's franchise, Mr Asquith was much persecuted by 'militant Suffragettes.' Home Rule and Welsh Disestablishment Acts were passed, but their coming into operation was postponed on account of Britain's entry upon the Great European War. Mr Asquith himself became War Secretary. He formed a Coalition Cabinet in 1915, but was ousted from office by Mr Lloyd George next year, and at the General Election of 1918 lost his seat (East Fife). In 1920 he returned to the House as member for Paisley, and led the Independent Liberals, and later the superficially united party. In 1924 Paisley fell to the Labour candidate, and Mr Asquith soon after accepted an earldom. Party dissensions broke out afresh in 1926, and a few weeks later Lord Oxford resigned the leadership. His second wife, Emma, Alice Margaret ('Margot'), daughter of Sir Charles Tennant, wrote a vivacious and audacious *Autobiography* (1920-22) and *Places and Persons* (1925). His second son (by his first marriage), Herbert Asquith, born in 1881, made a name as a poet; his younger daughter, Princess Elizabeth Bibesco wrote lively novels.

Ass, an animal differing from the Horse (q.v.) in having short hair at the root of the tail and a long tuft at the end, in the absence of warts on the hind-legs, and in the persistence of stipes, except in albinos. The upright mane, the long ears, the cross stripe on the shoulders, and the dark bands on the back are also characteristic. Its domestication took place at an early date, probably before that of the horse, from a type like the present Abyssinian ass (*Equus asinus*), and apparently in Asia; but the donkey has been common in England only since Queen Elizabeth's time. In Arabia, Syria, Egypt, Spain, Kentucky, and elsewhere asses are well cared for, and the breed has been considerably varied and improved. The stupidity for which the animal has for long been proverbially reproached seems largely the result of human influence. The male ass is capable of procreation at two years old; the female carries her foal twelve months. The mule is a hybrid bred between mare and male ass; while the *hinny* is the rarer result of hybridism between horse and female ass. The mule is much nearer in temper and appearance to the ass than to the horse; the hinny in some points resembles the horse more, as it neighs, while the mule brays like the ass. The ass is admirably adapted for a beast of burden, being remarkable for endurance, hardiness, and docility under kind treatment. The peculiar pace, the quaint intelligence, often superior in spite of ill-usage to that of the horse, curious traits of character such as the aversion to cross water, which is probably an unconscious recollection of ancestral nomadic life, the longevity and general hardiness, are familiar.

The wild asses, handsomer than the domestic, have shorter ears, and longer, finer limbs. The shy, swift *E. onager* occurs in herds in the Asiatic deserts, migrating southwards in winter. The large, handsome *E. hemionus*, with dark stripes on its back, inhabits high plateaus from Tibet to Mongolia. See DZIGGETAI; also ZEBRA and QUAGGA.

The wild ass is hunted in the East—e.g. in Persia; and the flesh is much esteemed. The milk of the ass is more sugary and less cheesy than that of the cow, and is on that account recommended

to some invalids—e.g. consumptives. The leather called Shagreen (q.v.) is made from the skin, which is also utilised for shoes and drums. The

The Wild Ass.

ancients are said to have used the bones for making flutes. From early times, white (albino) asses were reserved for the use of the honoured. See Darwin's *Animals and Plants under Domestication*; and the article DOMESTICATION.

Assab, a port, bay, and province of Eritrea, on the west coast of the Red Sea, 40 miles NW. of the Strait of Bab-el-Mandeb. The district around Assab Bay, with an area of 243 sq. m., was sold in 1870 by some Danakil chieftains to an Italian steamship company for a coaling station on the road to India. In 1880 it was taken over by the Italian government.

Assagai. See ASSEGAI.

Assai, a creamy, purplish beverage used on the Amazon, made from the fruit of Euterpe palms.

Assal, a large salt-lake in French Somaliland, nearly 9 miles from the coast of the Bay of Tadjura. It is nearly 600 feet below the level of the sea. Abyssinian caravans resort to Assal for the purpose of carrying off the salt, which is thickly encrusted on its shores.

Assam, in the NE. extremity of British India, was in 1874 formed into a separate administration under a chief-commissioner; and in 1905, on the division of Bengal, was united with Eastern Bengal to make a new province. It was again formed into a separate province in 1912. By the Government of India Act (1919) it became a 'governor's province.' It is represented in the Council of State by one member, in the Legislative Assembly by four. The Provincial Legislative Council has thirty-nine elected and fourteen nominated members. The country, which borders on Bengal, Burma, Tibet, and Bhutan, is mainly in the valley of the Bhalmaputra, which cuts the Himalayas at the base of Namcha Barwa (25,445 feet). The valley is bounded on both sides by mountainous territory, including the Garo, Khasi, and Jaintia Hills. Minor streams are abundant. The annual rainfall is in some parts (as the Khasi Hills) the heaviest in the world, except perhaps a spot in Hawaii. The low-lying regions suffer from inundations. Earthquakes are not infrequent. The soil is fertile, but much of the land is under jungle, which produces valuable timber, and shelters elephants, rhinoceroses, tigers, leopards, bears, and buffaloes. Coal and petroleum

are largely produced, and there is plenty of limestone and iron. Rice is the main crop; tea is also very important; and besides rice and tea, cotton, silk, jute, mustard-seed, rubber, ivory, and gold are exported. The commerce is largely in the hands of Jains; but the tea-gardens, which developed enormously in the last quarter of the 19th century, are mostly owned and managed by Europeans, the labourers being mainly coolies from other parts of India. Of the total area of 61,500 sq. m., 53,000 are British, the rest being under the Maharaja of Manipur (q.v.) and minor native chiefs. To snakes and tigers are attributed many deaths annually, both amongst men and cattle.

In 1826, at the close of the first Burmese war, Assam was ceded to the British, but the upper portion was conferred on the native raja, whom the Burmese had expelled; in 1838, because of his misgovernment, the entire country was placed under British administration. The only towns of any size are Shillong (the capital), Sylhet, Gauhati, and Sebsagar. A majority of the people are Hindus in faith; but 27 per cent. are Mohammedans, and 17 per cent. are aboriginal heathens. The principal native races are of the Shan stock (see BURMA); they are short and robust in person, with flat faces, high cheek-bones, and coarse black hair. In most of the tribes the native Mongolian has been largely mixed with Hindu blood, so that in some the Hindu type is predominant. Besides the Assamese, whose language is akin to Hindi and Bengali, there are in the hills tribes of Lushai stock. The total population increased from under 5,000,000 in 1881 to nearly 8,000,000 in 1921 (including some 384,000 in Manipur). See the series of monographs published by the Assam government, including *The Garos*, by Major Playfair (1910), and *The Nagas*, by T. C. Hodson (1911); and the *History of Upper Assam*, &c., by L. W. Shakespear (1914).

Assandun. See ASHINGTON.

Assassination, the act of taking the life of any one by surprise or treacherous violence, either by a hired emissary, by one devoted to the deed, or by one who has taken the task upon himself. Generally, the term is applied to the murder of a public personage by one who aims solely at the death of his victim. In ancient times assassination was not unknown, and was often even applauded, as in the scriptural instances of Ehud and Jael, and in the murder of Hipparchus by Harmodius (q.v.) and Aristogeiton; but assassination by enthusiasts and men devoted to an idea first becomes really prominent in the religious struggles of the 16th and 17th centuries. To this class belong the plots against the life of Queen Elizabeth; while the horrible succession of assassinations of Roman emperors is simply a series of murders prompted by self-interest or revenge. Omitting these last, which are noted elsewhere, the following list includes the most important assassinations, arranged in chronological order. With one or two exceptions, fuller accounts of the persons mentioned will be found under their particular headings.

Julius Caesar	Mar. 15,	B.C. 44
Thomas Becket	Dec. 29,	A.D. 1170
Albert I., Emperor of Germany	May	1, 1308
James I. of Scotland	Feb. 21,	1437
Alessandro de' Medici	Jan	5, 1587
Cardinal Beaton	May	29, 1546
David Rizzio	Mar.	9, 1566
Lord Darnley	Feb.	10, 1567
James, Earl of Moray, Regent	Jan.	23, 1570
William of Orange	July	10, 1684
Henry III. of France, by Jacques Clément	Aug. 1-2,	1589
Henry IV. of France, by Ravallac	May	14, 1610
Villiers, Duke of Buckingham, by Felton	Aug. 23,	1628
Wallenstein	Feb.	25, 1634
Archbishop Sharp	May	8, 1679
Gustavus III. of Sweden	Mar. 16; died Mar.	29, 1792

Marat, by Charlotte Corday.....	July 13, 1793
General Kleber, at Cairo.....	June 14, 1800
Paul, Tsar of Russia.....	Mar. 24, 1801
Spencer Perceval, premier, by Bellingham.....	May 11, 1812
Kotzebue, the dramatist.....	Mar. 23, 1819
Duc de Berry.....	Feb. 13, 1820
Charles III., Duke of Parma.....	Mar. 26; died Mar. 27, 1854
Abraham Lincoln, by Booth.....	April 14; died April 15, 1865
Michael, Prince of Serbia.....	June 10, 1868
Marshal Prim.....	Dec. 28; died Dec. 30, 1870
Georges Darboy, Archbishop of Paris, by communards.....	May 24, 1871
Earl of Mayo, governor-general of India.....	Feb. 8, 1872
Sultan Abdul-Aziz.....	June 4, 1876
Alexander II., Tsar of Russia.....	Mar. 13, 1881
President Garfield.....	July 2; died Sept. 19, 1881
Lord Frederick Cavendish and Mr Burke.....	May 6, 1882
President Carnot, by an anarchist.....	June 24, 1894
Stambuloff.....	July 15; died July 18, 1895
Empress of Austria.....	Sept. 10, 1898
Humbert, King of Italy.....	July 29, 1900
President McKinley.....	Sept. 6; died Sept. 14, 1901
King and Queen of Serbia.....	July 11, 1903
Grand-duke Sergius of Russia.....	Feb. 17, 1905
King and Crown Prince of Portugal.....	Feb. 1, 1908
Stolypin.....	Sept. 14; died Sept. 13, 1911
George, King of Greece.....	Mar. 18, 1913
Archduke Franz Ferdinand and his wife.....	June 28, 1914
Jaures.....	July 31, 1914
Count Stuerghk, Austrian premier, by Fitz Adler.....	Oct. 21, 1916
Count Tisza, Hungarian premier.....	Oct. 30, 1918
President Paes of Portugal.....	Dec. 14, 1918
Karl Liebknecht and Rosa Luxemburg.....	Jan. 15, 1919
President Eisner of Bavaria.....	Feb. 21, 1919
Walther Rathenau.....	June 24, 1922
Michael Collins.....	Aug. 22, 1922
President Narutowicz of Poland.....	Dec. 16, 1922

The *Assassination Plot* was a conspiracy by Jacobites to murder William III. (q.v.) in 1696—he was to have been assassinated at Turnham Green on his return from a hunting-party; but one of the forty conspirators sent word to the king. See also ANARCHISM, DYNAMITE, NIHILISM, POLITICAL OFFENCES, THUGS.

Assassins, a fanatical branch of the secret Moslem sect of the Ismailis (q.v.). The esoteric doctrines of the latter taught that all actions were morally indifferent; and the atrocious career of the Assassins was but a natural sequence of such teaching. The founder of this body, Hassan-ibn-Sabbah, a Shiite of Khorassan, had, about the middle of the 11th century, studied at Nishapur, and had subsequently obtained from Ismaili *dais*, or religious leaders, a partial insight into their secret doctrines, and a partial consecration to the rank of *dai*. But at Cairo he quarrelled with the heads of the sect, and was forced to quit Egypt, and return by Aleppo and Damascus to Persia. Here he gradually gathered followers, and in 1090 he conquered the rock-fortress of Alamut, in Persia, founding there a famous society, resembling the Ismailis in speculative doctrines, but marked by one peculiar feature—the employment of secret assassination against all enemies. The internal constitution of the order was as follows: First, as supreme and absolute ruler, came the *Sheikh-al-jebel*, the ‘Old Man of the Mountains.’ Then came his three viceregents, the *Dai-al-keirbal*, or grand-priors of the order; thirdly, the *Dais*, or priors; and fourthly, *Refiks*, associates, which last were not initiated, like the former, into all the secret doctrines. To the uninitiated belonged first of all the *Fedavis* or *Fedais* (‘the devoted’), a band of resolute youths, the ever-ready and blindly obedient executioners of the Old Man of the Mountains. Before he assigned to them their bloody tasks he used to have them thrown into a state of ecstasy by the intoxicating influence of the *hashish* (the hemp plant), which circumstance led to the order being called *Hashishin* (‘hemp-eaters’). The word was changed by Europeans into *Assassins*, and transplanted into the languages of the West with the signification of ‘murderers.’ The *Lasiks*, or novices, formed the sixth division of the order, and the labourers and mechanics the seventh.

Upon these the most rigid observance of the Koran was enjoined; while the initiated, on the contrary, looked upon all positive religion as of no importance. This powerful and unscrupulous sect soon inspired widespread terror. Hassan died in 1124, leaving as his successor his chief *dai*, Kia-Busung-Omid. Under him the Assassins established a stronghold in Syria, and proved their power by the murder of two successive khalifs. In 1163 Hassan II. was rash enough to extend the secret privilege of the initiated—exemption, namely, from the positive precepts of religion—to the people generally, and to abolish Islamism in the Assassin state, which led to his falling a victim to his brother-in-law’s dagger. Under the rule of his son, Mohammed II., who acted in his father’s spirit, the Syrian *Dai-al-keirbal* Sinan became independent, and entered into abortive negotiations with the Crusaders. It was his emissaries who killed Count Raymond of Tripoli and Conrad of Montferrat. Mohammed was poisoned by his son, Hassan III., who reinstated Islamism for the uninitiated. Hassan was succeeded by Mohammed III., a boy only nine years old, who, by his effeminate rule, led to the overthrow of the order, and was eventually murdered by the command of his son, Rokneddin, the seventh and last Old Man of the Mountains. In 1256 the Tatar prince, Hulaku, burst with his hordes upon the hill-forts of Persia held by the Assassins, and destroyed them. The Syrian branch was also nearly extirpated in 1270 by the Mameluke sultan, Bibais. But they still have representatives amongst the obscure Moslem sects of Syria and India.

See ANSARS, DRUSES; Hammer-Purgstall, *Die Assassinen* (1888); Walpole, *The Assassins and the Assassins* (1851); E. G. Browne, *Literary History of Persia* (1906); Miss Bell, *The Desert and the Sown* (1907).

Assault. In English law, a person is guilty of an assault if he attempts unlawfully to apply any force, however slight, to the person of another, or if he uses any gesture indicating an intention to commit an assault. If any force, however slight, is actually applied to the person or dress of another, the act amounts to *battery*. If a person violently deprived another of a member proper for his defence, such as a leg, an arm, a finger, an eye, or a fore-tooth, the ancient law held him guilty of *mayhem* or maiming; but this term is now obsolete. Violence is not necessary to constitute an assault; for the law, says Blackstone, cannot draw the line between different degrees of violence, and therefore prohibits the first and lowest stage of it, every man’s person being sacred. Mere words can never constitute an assault.

Assault is a civil wrong, giving rise to an action for damages; and, as a general rule, the court will not interfere with the discretion of the jury in assessing the damages. It is sufficient to prove any act from which the unlawful intention may be implied. Thus, throwing water on a man, or riding after him and compelling him to run away, are both acts of trespass or assault. If X throw a lighted squib at Y, who in self-defence throws it from him so that it falls on Z, this is an assault by the first thrower, X, on Z. The defendant may plead that his act was unavoidable, or that it was committed by leave of the plaintiff, or in self-defence, or (if the plaintiff be his child) that the assault was committed by way of reasonable chastisement. He may also plead that the case has already been disposed of by a court of summary jurisdiction; and magistrates dealing with ordinary charges of assault are empowered to give a certificate which protects the person charged against further proceedings.

A common assault is a misdemeanour, punishable by one year’s imprisonment. It is plain that

all crimes against the person, such as robbery or murder, include an assault. Special statutory provisions apply to the following cases of aggravated assault: (1) Indecent assault. It is an assault to take indecent liberties with a female, even if her consent is procured by fraud, as, e.g., if the offender pretends to be her husband. (2) Assaults on public officers, clergymen, &c. in the performance of their duties. (3) Assaults causing actual bodily harm, which are punishable by five years' penal servitude. Assaults with intent to do grievous bodily harm, as, e.g., by shooting, or administering poison, or placing an obstruction in front of a railway train, usually amount to felony, and are punishable with penal servitude for life. Maliciously starving a servant or apprentice is a misdemeanour.

Generally speaking, the same defences may be relied on in criminal and civil proceedings. But consent is no defence where the injury done extends to maiming, or to a breach of the peace. The principals in a prize-fight, for example, are guilty of assault, and all persons present at the fight are aids and abettors in the commission of the offence.

In Scotland the principle of the law of assault, and of its aggravations, is very much the same as that above stated. In the Scottish system, it is laid down that it is of the utmost importance in all cases of actual assault to ascertain who struck the first blow, and the party who receives it will be excused for retaliating, if he do not exceed the just and fair measure of resentment. There, too, the highest of all aggravations is the assault with intent to murder. It is also an aggravation that the assault has been committed in pursuance of an old grudge, and on a principle of revenge; where, also, the offence has been accompanied with an intent to compel a rise of wages, or to deter from working at a certain rate, or in pursuance of a combination entered into for these illegal purposes. Another aggravation of the offence in Scotland is its being committed by a child on its parent, by a husband on his wife, or by any person upon another within his own house, although the latter crime falls more strictly under the antiquated term of *Hamesucken* (q.v.). The remedy in Scotland is, as in England, by civil action of damages, and by a criminal prosecution, both being maintainable, and the latter usually at the suit of the Lord Advocate, as public prosecutor; but the private injured party may prosecute criminally should the Lord Advocate decline to do so.

The Scots law formerly recognised a separate offence known as battery *pendente lite*, which consisted in assaulting an adversary in a lawsuit during its dependence. This offence was created by statute passed in 1584 and 1594, which provided, quaintly enough, that the offender should be punished by losing his cause. The statutes in question were repealed in 1826.

In the United States the same general definition of an assault is accepted. Special statutes provide for punishment of assaults on government officials while in the discharge of their duty; but in general, assaults, whether with or without a dangerous weapon, are punishable under state laws rather than under those of the United States.

Assaye, an Indian village in the extreme north-east of the Nizam's Dominions, 43 miles N.E. of Aurungabad, the scene (best visited from Sillod) of a decisive victory gained by General Wellesley, afterwards Duke of Wellington, 23d September 1803, with 4500 men, over a Mahratta force of 50,000 under Sindia and the raja of Berar. About a third of Wellesley's small force was killed or wounded, while 12,000 of the enemy fell. The victory was the first great blow to the Mahratta supremacy.

Assaying is the art of determining the proportion of any specified metal in a given metallic ore or in an alloy. The various methods of estimating the amounts of base metals present could not, however, be usefully set forth within the limits of the present article, and the reader who requires technical information in regard to them is referred to the special works enumerated at the end: we shall here limit our attention to the methods commonly adopted for ascertaining the amount of gold or silver present in an ore or alloy.

Assaying of Gold and Silver Ores and Bullion.—The gold and silver in a sample of ore for assay are usually concentrated from the fused mass in molten lead, generally reduced from its oxide. The methods used are 'fusion' and 'scorification.' Where carbonaceous and some other harmful substances are present the ore must first be roasted. Such roasting is conducted in an open dish with free access of air in a muffle furnace.

Scorification.—The process of scorification is conducted in a muffle furnace, in a non-porous fireclay dish or 'scorifier' heated to a much higher temperature than for merely roasting. One part by weight of a carefully taken sample of the ore in a fine state of division is mixed in the scorifier with from ten to twenty times its weight of granulated lead and one-tenth its weight of borax, and the whole placed in the muffle. On withdrawing the scorifier after about half-an-hour, its contents are poured into a cup-shaped iron mould, and when cold the slag can be detached from the lead button. This latter contains all the gold and silver originally present in the ore, and only requires to be cupelled, as explained below.

Fusion.—The prepared ore is mixed with red-lead, charcoal-powder, carbonate of soda, and borax, in proportions depending on the nature of the ore, and placed in a crucible which is heated in an ordinary furnace for about a half to three-quarters of an hour, when the whole may be poured into a mould, and a lead button, containing the precious metals, obtained as in the scorification process.

Cupellation.—The 'cupellation' method of assaying gold and silver is of great antiquity. It depends essentially on the fact that molten litharge, monoxide of lead, PbO, is capable of holding in solution oxides of other metals with which it may be brought in contact, and thus separating them from unoxidisable metals. If, for example, gold, silver, copper, and lead are brought into a state of fusion in a current of air, the lead on becoming oxidised will take up the oxidised copper; the gold and silver, however, being unoxidisable, will not be so absorbed. The oxides are absorbed in a 'cupel,' formed of compressed bone-ash or other 'composition,' of some such form as is shown in fig. 1. The molten gold and silver, being unabsorbed, remain on its surface like a bead of mercury. One or more of these cupels, according to the number of assays to be made, are arranged on the floor of a muffle or oven of fireclay, provided with orifices at the sides and ends to produce the requisite draught, as indicated in fig. 2, and heated externally by anthracite, coke, charcoal, gas, or oil.

The operations comprised in the assay of an alloy containing silver by cupellation may be thus briefly described. A clean piece of the alloy, say '5 grammes in weight, is accurately weighed on an assay balance. It may then conveniently be wrapped up in the whole or a portion of the lead required for cupellation in the form of foil. The amount of lead taken, being dependent on the proportion of oxidisable metal present in the alloy, will, of course, depend on the composition as approximately judged from the colour, appearance of cut, &c.: three times the weight of the assay-piece for fine, or nearly fine, silver, six times for

English standard (925 fine, or parts per 1000), and a still greater proportion for coarser varieties. The muffle having been raised to a red, but not

Fig. 1.

Fig. 2.

bright-red, heat, the assay parcel is charged into a cupel, and the temperature maintained uniform. After a lapse of from twenty minutes to half-an-hour it will be found that all the lead has been converted into litharge, and either volatilised or absorbed by the cupel, the completion of the operation being preceded by the passage of brilliant indescent colours over the surface of the button, and, as soon as these cease, by an instantaneous increase in its brilliancy, known as *flashing* or *brightening*. The muffle is now closely shut up, and the temperature allowed to fall gradually until the button is set. It is then removed, hammered to detach adhering bone-ash, and weighed.

If there is reason to suspect the presence of small quantities of gold, it will only be necessary to dissolve the silver button, after weighing, in nitric acid (equal parts pure acid and water), collect the black deposit (the gold) that remains undissolved, and wash, ignite, and weigh it.

The cupellation assay for silver alone is now rarely practised. The losses due to volatilisation are large, and great care must be exercised in the regulation of the muffle temperature.

In many cases it is possible to ascertain the amount of silver present in an alloy without resort to cupellation. For this, the *wet*, or Gay Lussac's, method, it is essential that the composition be previously known within comparatively close limits. Knowing this, it is easy to calculate what weight of the alloy contains 1 gramme of pure silver. This amount having been dissolved in nitric acid (equal parts pure acid and water), a measured volume of solution of common salt, standardised so as to precipitate exactly 1 gramme of silver, is added. By vigorously shaking the bottle for a few minutes, the white precipitated chloride will agglomerate, leaving a clear solution above. On adding 1 cubic centimetre of a salt solution, one-tenth the strength of the one previously used, a white film appears on the surface, due to the precipitation of a further small quantity of silver chloride. The density of this film can be judged by placing the bottle against a black background, and is an indication of how much more salt solution should be added to precipitate all the

silver. This quantity of salt solution is added, and the bottle reshaken. The end point is reached when no film appears on adding an additional cubic centimetre of the decimal salt solution. The volume of salt solution thus used affords a means of calculating how much silver was contained in the original assay sample.

The usual mode of ascertaining the approximate assay of a silver alloy is by the 'Vollhard' method or by ordinary cupellation. The Vollhard method consists in precipitating the silver from a known weight of the alloy dissolved in dilute nitric acid by a standard solution of ammonium sulphocyanide. The end point is determined by the appearance of a faint red colour, due to the reaction of the ammonium salt with a small quantity of iron alum previously placed in the silver solution. The iron is not attacked until all the silver has been thrown out of solution as silver sulphocyanide. The volume of ammonium sulphocyanide solution used indicates the amount of silver originally present.

The assaying of gold alloys is always effected by cupellation, and, in the rare event of silver being known to be entirely absent, a simple cupellation with lead, as in the case of silver, will suffice, a gold button being obtained and weighed. If, however, silver is present, silver is added if necessary, so that there may be a quantity of that metal equal to about two and a half times the weight of gold in the original alloy. The object of this *inquantation* is to obtain a button in which the gold is distributed like a sponge so as to facilitate the subsequent removal of the silver by solution in nitric acid. The amount of lead varies, as in the case of silver, with the composition. With gold, from pure down to 916.6 fine, about eight times its weight; from this point to 625.0 fine, twelve to twenty times; and for lower qualities, twenty-four times its weight will generally suffice. The assay-piece, which usually weighs half a gramme, having been very accurately weighed, is wrapped, together with the requisite silver, in the lead, and charged into a cupel in the muffle, either by hand or, when large numbers of assays are being done

Fig. 3.

together, by a special charger. The temperature is appreciably higher than when cupelling silver. The phenomena observed are similar to those already described, and, on its removal from the cupel, the button, having the form shown at a in fig. 3, is brushed, flattened (b) on an anvil, annealed at a red heat, and drawn out into a *fillet* (c) in a small rolling-mill to about the thickness of a visiting-card, in order still further to facilitate the removal of silver. After being again annealed, this is coiled into a *cornet* (d) between the finger and thumb. In large assay offices, as in that of the Royal Mint, a platinum boiling apparatus is now generally employed. For smaller numbers of assays, the older method of boiling separately in 'parting' flasks is available. In the former method, each cornet is placed in a small perforated platinum cup, a number of these being ranged on a tray of the same metal, which is introduced into the acid (specific gravity 1.2) contained in a boiler, also of platinum. After remaining for

about twenty-five minutes the tray is removed, washed thoroughly in two quantities of hot distilled water, and then boiled for a similar period in a fresh quantity of acid of the same strength as before. On again being removed, the tray is washed, drained, and raised to a red heat in the muffle, which causes the dull-red fragile cornets to cohere, assume the yellow colour of gold, and shrink in about the proportion of *d* to *e* (fig. 3). The cornets are then weighed.

In parting in a flask, the cornet is boiled for ten minutes in 2 or 3 fluid ounces of the first acid, the flask nearly filled with hot distilled water, and decanted. A similar quantity of the second acid having been added, the boiling is continued for fifteen minutes, and water again added. After decanting, and once or twice washing, the cornet is transferred to a small porous crucible, in which it is annealed at a red heat, and then weighed.

Proofs or Checks.—It is always preferable in both the cupellation and volumetric methods of assays for gold and silver to have proofs or checks, which are made up of pure metals, and are of similar composition to the alloy to be tested. They are treated in exactly the same manner as the true assays, and the losses (or gains) which they sustain must be added to (or subtracted from) the final weight of those assays.

Where both silver and gold are contained in an alloy, it becomes necessary either to perform separate assays or to subject one assay-piece to cupellation twice. The assay is first conducted without adding silver, and the resulting button weighed as though it were a silver assay. After adding silver and lead, the button is again cupelled and treated as a gold assay. The weight of gold finally obtained is deducted from that of the first button, and the difference gives the weight of silver present. Some experience is necessary in order to estimate this latter metal accurately.

For detailed information see Beringer, *Text-book of Assaying*, 15th ed.; Rose, *Metallurgy of Gold*, 6th ed.; Wright, *Assaying in Theory and Practice*; E. A. Smith, *Sampling and Assay of the Precious Metals*.

Assegai, or ASSAGAI, a slender spear of hard wood, tipped with iron, used in battle by the South African tribes, notably the war-like Zulus. Some

Various forms of Assegais.

assegais are held in the hand and used as spears for thrusting; shorter ones are hurled from the hand as missiles. The Berber word *zaghāya* was adopted by the Moors into Arabic (with the article *al*), and thence into Spanish and Portuguese. It was the Portuguese use of it in Africa that passed into English and French. It had already been used in Middle English in the forms *archegaye* and (as in Chaucer) *lancegay* (compounded with *lance*).

Assegai Wood, a hard timber, useful for wagon and carriage building, yielded by the South African cornaceous tree *Curtisia faginea*.

Assemani, (1) JOSEPH SIMON, a famous orientalist, born of a Maronite family at Tripoli, in Syria, in 1687. After completing his studies at Rome, he

travelled on the pope's commission through Egypt and Syria, collecting many oriental MSS. and coins for the Vatican Library, of which he was appointed keeper. He died at Rome, January 14, 1768. Of his numerous learned works, the most important is his *Bibliotheca orientalis Clementino-Vaticana* (4 vols. Rome, 1719-28), containing the Syrian MSS. of the Vatican. He was succeeded as keeper of the Vatican Library by his nephew, (2) STEPHEN EPHODIUS (1707-82), also a learned author of books on orientalist learning. Yet another nephew and orientalist was (3) JOSEPH ALOYSIUS (1710-82), professor at Rome.—(4) SIMON, a relative of the preceding, was born at Tripoli in 1752, filled the chair of oriental languages at Padua, and died there, April 8, 1821. One of the greatest orientalists of his time, he wrote an important work on ancient coins, *Museo cufico Namiano illustrato* (2 vols. Padua, 1787-88).

Assembly, GENERAL, is still, as it was in colonial days, the name of the collective legislature of some of the United States; but is better known as the official name for the highest court in the greater Presbyterian Churches in Scotland, Ireland, India, the Dominions, and the United States. It represents both the lay and the clerical element in the church, and possesses legislative and judicial authority in all matters purely ecclesiastical. The General Assembly of the Established Church of Scotland consists of representatives, clerical and lay, from all the presbyteries of the church. The royal burghs of Scotland also return elders to the General Assembly of the Established Church, and each of the Scottish universities sends a representative. The Assembly meets once a year, in the latter part of May, at Edinburgh, and sits for ten days. Its deliberations are presided over by a Moderator, whose election is the first step in the proceedings, after a sermon by his predecessor. In former times this office was sometimes filled by laymen—among others, in 1567, by George Buchanan. In modern times the moderator is always a clergyman. Eighty-four presbyteries, composing sixteen synods, return members to the General Assembly of the Established Church of Scotland. Its relation to the state is represented by a royal commissioner, who exercises no function in the Assembly beyond that of adding by his presence the sanction of the civil authority to its proceedings. The other functionaries are a principal and a depute clerk (both clergymen), a procurator, and an agent. All business not despatched during the session is referred to a commission, with the moderator as convener, which meets immediately after the dissolution of the Assembly, and again at intervals of three months. The General Assemblies of the Free Church of Scotland (in 1900 joined with the United Presbyterians as the United Free Church) and of the Irish Presbyterian Church are similarly constituted save in comparatively minor matters—such as the absence of the royal commissioner. There are also General Assemblies of 'the Presbyterian Church in the United States,' the Cumberland Presbyterian Church, and the United Presbyterian Church of North America; while the Reformed Presbyterian Synod, the Associate Reformed Presbyterian Synod, and the Associate Synod of North America call their supreme courts synods. See PRESBYTERIANISM, SCOTLAND, FREE CHURCH.

Assembly, NATIONAL. See CONVOCATION; also FRANCE.

Assembly of Divines. See WESTMINSTER, CONFESSIONS OF FAITH.

Assen, chief town of the Dutch province of Drenthe, connected with the Zuyder Zee by canal, and with Groningen by railway; pop. 13,000.

Asser, King Alfred's biographer, was a monk of St Davids (*Menevia*), who, about the year 885, was invited to the court of Alfred. Here he resided at intervals till the king's death (901), assisting him in his studies, and enjoying an affectionate confidence, of which he seems to have every way been worthy. Alfred promoted him to various dignities, and prior to 900 made him Bishop of Sherborne. He died in either 909 or 910. His life of Alfred, *De rebus gestis Alfredi Magni*, was published, with interpolations, in 1572, by Archbishop Parker. Its genuineness was questioned by Wright and Howorth, but was accepted by Kemble, Pauli, Stubbs, Freeman, and Stevenson. Wise's edition (1722) preceded Petrie's *Monumenta Hist. Brit.* (1848); by far the best is Stevenson's (1904).

Assessment is a valuation of property, income, or profits, for the purpose of taxation, made by authorised persons according to their discretion, as opposed to a sum determined by law; or the fixing of the amount of damages, as by a jury. See **TAX, COSTS, DAMAGES, VALUATION**.

Assessors are persons sometimes associated with judicial functionaries, to assist in the argument and procedure before them, and to advise their judgments. They may be usefully employed by persons in judicial stations whose previous education and pursuits scarcely qualify them for the duties cast upon them. Assessors are usually barristers or advocates learned in the law, and familiar with judicial proceedings. By the Municipal Corporation Act, it is enacted that the burgesses shall annually elect from among those qualified to be councillors two auditors and two assessors, the former to audit the accounts of the burgh, and the latter to revise the burgess list. In the ecclesiastical law of England, a bishop, who is a spiritual judge, is assisted by his chancellor, as the episcopal assessor, and who in fact holds courts for the bishop. But in the case of a complaint against a clergyman for any ecclesiastical offence under the Church Discipline Act of 1840, the bishop is directed to inquire into the matter, assisted by three assessors, of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one, and a barrister another. In Admiralty cases the judges may command the assistance of nautical assessors. The judges of the common law courts and the King's counsel are, as a condition of their offices, assessors, or more properly assistants, of the House of Lords, advising the House on points of law which may be propounded to them by their lordships. In the Scottish universities, certain nominated members of the university court are called assessors.

In the United States, the term is only employed in the common sense of persons elected or appointed to determine the value of property liable to assessment.

Assets (Norman-French *asez*, 'enough,' from late Lat. *ad satis*, 'to sufficiency'), a term signifying the property of a deceased person which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate, and without any debts to be paid. In general acceptance, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or to a trading association.

Assets are either *personal* or *real*, the former comprehending such goods, chattels, and debts as devolve on the executor; and the latter including

all real estate, whether devised or descending to the heir at law. In connection with this distinction, assets are also said to be *assets by descent*, and *assets in hand*, the former of these being recoverable from the heir to whom the land descends, and so far as such lands will extend—assets in hand, again, signifying such property as a person leaves to his executors sufficient for the clearing of burdens and bequests affecting his personal estate. Assets are also in their nature either *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. Where there are several creditors of equal degree, the executor is bound to pay him who first obtains judgment for his debt; and he cannot resist on the ground that nothing will be left for the other creditors. If, after exhausting the whole assets which have come to his hands, by the payment of debts in due order, he be afterwards sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or technically by a plea of *plene administravit*; and upon this plea the creditor is entitled to judgment that he shall be paid out of any other assets that shall come to the defendants—which is called a judgment of assets *in futuro*.

Assets is not a law term in Scotland, but it is nevertheless much used in the business of that country.

In the United States, the assets are broken up into several funds, and where some of the creditors can resort to two or more funds, while others can legally only resort to one, a court of equity will, by 'marshalling assets,' compel the more fortunate creditors to exhaust the fund first upon which they have the exclusive claim; or, if they have been satisfied from the general fund, to permit others to stand in their place as to the exclusive fund, that so an equitable division of assets may be made among all the creditors.

Assheton, WILLIAM (1641–1711), a pioneer of insurance, was born at Middleton, Lancashire. He studied at Oxford, became a fellow of Brazenose (1663), and chaplain to the Duke of Ormonde, who was chancellor of the university. He was made a prebendary of York, and held livings in London and Beckenham, where he died, having declined the mastership of his college. He published many discourses and theological works, among others *The Possibility of Apparitions* (1706), occasioned by Defoe's story of Mrs Veal. His scheme for providing annuities for widows of the clergy and others was adopted by the Mercers' Company (1698), but broke down. Parliament was appealed to in 1747, and enabled the company to meet its engagements.

Assidians. See CHASIDIM.

Assien'to (Span. *asiento*, 'contract'), a word specially applied to a contract between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. Charles V. first formed such a compact with the Flemings; and similar ones were entered into with the Genoese (1580), with the French Guinea Company (1702), and with England (1713). The British government made over its privilege to the South Sea Company for thirty years, permission being also granted to send yearly a ship, carrying 500 tons of goods, to the Spanish colonies. The misunderstandings arising hence contributed not a little to the war that broke out between the two nations in 1739. At the peace of Aix-la-Chapelle in 1748, the English company having still four years to run, their rights were guaranteed to them; but they relinquished them

at the Madrid Convention of 1750, upon the payment of £100,000, and the concession of certain commercial advantages.

Assign is a legal term used in both English and Scottish law to indicate generally the transfer of property, but more particularly the transfer of movable property and personal rights. The word is also applied to the person, generally spoken of as the 'assignee,' to whom the transfer is made.

Assignment is a form in Scots conveyancing, analogous to the English Assignment (q.v.), by means of which the holder of any right, or the creditor in any obligation—including even a future right which is not yet vested—transfers his right to another. The party making the assignment is called the *cedent*, and the party in whose favour the assignment is made is called the *assignee* or *cessionary*, words which are derived from the French law. In the case of debts, there was originally no power in the creditor to assign his right, and, accordingly, the old form of assignment still shows that the transaction was regarded as one of mandate to recover the money for the creditor. Now, however, it is recognised that an assignment operates as a direct conveyance, by which the whole right of the creditor is transferred to the assignee, who comes exactly in place of his author. Simple forms of assignment have been introduced by statute; but it is settled that a written instrument of assignment need not be couched in any formal words, or even contain words of actual conveyance. In order, however, to complete the assignment, it must be *intimated* to the common debtor—that is, the party originally indebted to the cedent—and so essential is this intimation that in the case of competing claims against the right, interest, or estate assigned, the assignment first intimated will be preferred to one prior in date, but posterior in the date of intimation. Various modes of intimation to the debtor are recognised at common law or have been introduced by statute. Between the parties, of course, mere private knowledge on the part of the debtor is sufficient, but this will not give a preference in a competition between assignees or between an assignee and an arresting creditor. But there are certain assignments which require no intimation, such as adjudication and other judicial assignments, marriages contracted before 1881, which were legal assignments of the wife's movable estate to the husband, and the statutory conveyance to a trustee in bankruptcy. The assignment of a debt implies and warrants that the debt is due, but not that the debtor is solvent. Bills, notes, and other negotiable instruments do not require assignment, but pass by indorsation and delivery. Special statutory provision is made for the assignment of policies of insurance, patents, copyrights, and shares in a company. Personal rights to land are also the subject of assignment, and every conveyance of land contains one clause assigning the rents, and another assigning the writs—that is, the title. In Scottish agricultural leases, assignees are generally excluded expressly.

As'signats. After appropriating to national purposes the land belonging to the church, the French National Assembly, instead of bringing it into the market at a time of insecurity, when its value was depreciated, issued bonds on the security of it, which were called *assignats*, as representing land *assigned* to the holder. This paper-money consisted chiefly of notes for 100 francs (£4) each, though many of them were for lower sums; and the first issue, in 1790, amounted to 400 million francs. The system relieved the government; 'the assignats saved the revolution' for the time being. The facility of this plan of providing govern-

ment income led to its being repeatedly had recourse to, as the property of wealthy émigrés was confiscated, till the amount rose to the enormous sum of 45,578 million francs, besides great numbers of forged notes—for the assignats were easily counterfeited. The value of the assignats naturally soon began to decline, and confidence once gone, the declension became fearful. In June 1793 one franc in silver was worth three francs in paper; in August it was worth six. The state took the most extreme measures to compel the acceptance of these notes at their full nominal value. The effects of these were to cause the assignats to flow back into the public treasury, to raise the prices of all commodities, and to make every one averse to have any dealings with the state. All business became disorganised. At last the value of assignats sank almost to *nil*. Millions had suffered incalculable loss, and only a few who had bought public lands with the assignats that cost them little or nothing had enriched themselves at the expense of the community. In March 1796 a louis d'or (24 francs) bought 7200 francs in assignats. After this they were withdrawn from the currency, and redeemed at a thirtieth of their nominal value, by 'territorial mandates,' a new kind of paper-money, which enabled the holder at once to take possession of public lands at the estimated value, while assignats could only be offered at a sale. The *mandats* also soon fell to a seventieth of their nominal value, and were returned to government in payment of taxes or of land. The disastrous system of compulsory paper-credit came to an end early in 1797.

Assignee. See ASSIGN, ASSIGNATION. An Assignee in Bankruptcy is one of the persons officially appointed to manage a bankrupt estate for the benefit of the creditors, now called *trustee*. See BANKRUPTCY.

Assignment, in the law of England, is the name given to a conveyance by which the party making the assignment transfers or grants over a right not in possession, such as a bond, a debt, or other *Chose in action* (q.v.). In England, according to the strict rule of the old common law, no such right could be assigned or granted over, because such a proceeding was thought to be an encouragement to litigation. The only exception to this general rule was in the case of the crown, which might always either grant or receive a *chose in action* by assignment. Now, however, the proceeding is in constant practice. The courts of equity used to make the rule itself give way to the expediency of facilitating the transfer of property by directly sanctioning the practice; and even in those of common law the application of the ancient principle was evaded. The Judicature Act, 1873, provides for the assignment of *choses in action* by writing; notice of the assignment must be given to the debtor. Mortgages may be assigned; indeed the right to make such a transfer is one of the properties of a mortgage security. Assignment is also the proper mode of assurance or conveyance for passing estates in reversion, and for passing leasehold estates for years, and other chattel property. The Statute of Frauds requires the assignment of a lease, or of a trust, to be made in writing; and the Real Property Amendment Act, 1845, provides that the assignment of a chattel interest in land (not being copyhold) shall be made by deed, unless the interest is one which might by law have been created without writing (as, for example, a lease for less than three years at a rack-rent). Copyright (q.v.) is assignable.

In regard to the right of assignment generally, it may be laid down that the property in things personal is transferable with absolute freedom; and if

they are assigned under a condition which is either repugnant to the gift itself, or against the policy of the law—such as a prohibition to dispose of the property assigned—the condition is void. There are some cases, however, where the right of alienation is, in respect of the incapacity of the owner, suspended; as to which it will be sufficient to remark that the law with respect to the disability of infants, insane persons, and persons under duress, applies in general to personal as well as to real property. A married woman, too, was at common law under an absolute incapacity to make any transfer of things personal; with the exception of her equitable interest in property settled in trust expressly for her separate use, the goods and chattels which she possessed at the time of marriage, or subsequently acquired, belonged, by the general rule of law, to her husband. But the Married Women's Property Acts have given to married women almost all the rights of disposition enjoyed by single women. There are also some few cases where, in respect of the nature of the interest itself, its alienation is absolutely prohibited. Thus, generally, the pay or half-pay of a military or naval officer, or the salary of an office of trust, is, on a principle of public policy, not assignable, the object being to secure to such persons, even against their own improvidence, the possession of those means which are essential to the maintenance of their station and the performance of their duties. The sale or transfer of public appointments themselves is also, in general, contrary to the policy of the law, and in most cases expressly prohibited. See *Stephen's Commentaries*, Book II. chap. iv.

An assignment of goods and chattels is frequently made by a Bill of Sale (q.v.). Bills of Exchange (q.v.) and Promissory Notes (q.v.) are assigned by indorsement.

The corresponding term in the Scots law is *Assignment* (q.v.). But in that system, assignment is the legal and technical word for the transference of property in copyrights, patents, and registered vessels.

In the United States, assignment is of broader signification; it applies also to the transfer of real property by certain conveyance. In general, every right of property, real or personal, and every demand connected with a right of property, real or personal; and all *choses in action*, as bonds, notes, judgments, mortgages, debts, contracts, agreements, relating both to real and personal property, are assignable, and the assignment thereof will pass to the assignee a right of action in the name of such assignee against all parties liable to an action. Assignment carries with it all collateral securities held by the assignor for the collection of a debt or the fulfilment of a contract, and is subject to all the equities and charges which attached in the hands of the assignor. A personal trust, as the right of a master in his indentured apprentice, or the duties of a testamentary guardian, or the office of executor, trustee, &c., is not assignable. The validity of an assignment must be determined by the law of the state in which it was made, provided the thing assigned is subject of municipal or state law; but copyrights, patents, and government claims are governed by acts of congress. In general, assignments should be recorded in the office prescribed by law, or are void as against those claiming under subsequent assignments.

Assignment of Error. See ERROR, APPEAL.

Assimilation is the process by which living organisms absorb nutriment and convert it into part of their own substance, solid or liquid. See DIGESTION. In particular the word is applied to the separation of oxygen from carbon dioxide in the green parts of plants, and its working up into

organic compounds. See CHLOROPHYLL, PHYSIOLOGY (VEGETABLE).

Assiniboia was from 1882 till 1905 a Canadian district or territory within the limits of the North-west Territories; west of Manitoba, bounded on the south by the United States frontier, west (at 111° W.) by Alberta territory, north (at 52° N.) by Saskatchewan. In 1905, when the other two territories of Alberta and Saskatchewan were made provinces, Assiniboia and Athabasca ceased to be administrative divisions; the new provinces divided their territories between them, Saskatchewan taking four-fifths of Assiniboia, and Alberta the remaining fifth. Regina (formerly the capital of the North-west) is now the capital of Saskatchewan. The rich soil of the Qu'appelle Valley and other river-valleys is especially suitable for wheat-growing.

Assiniboine, a river of the Canadian North-west, formed by the junction in Macdonald county, Manitoba, of the Qu'appelle and Souris Rivers; at Winnipeg it joins the Red River (q.v.), which discharges its waters into Lake Winnipeg. At a point 140 miles from its mouth the Assiniboine is 230 feet broad, and its mean depth over 8 feet; its course measures about 400 miles. It is named from the Assinibouins ('stone-boilers,' because they heated water by dropping hot stones into it), the Algonquin Indians of the country; still 2000 or 3000 in number. From it Assiniboia took its name.

Assinie, a town in the Ivory Coast Colony (q.v.), on a lagoon 30 miles E. of Grand Bassam. It was occupied by the French in 1843.

Assisi, a town of central Italy, picturesquely situated on a steep hill, 14 miles SE. of Perugia by rail, with old walls and a citadel in ruins. It was the birthplace of St Francis (see FRANCIS OF ASSISI), who there in 1209 founded the mendicant order that bears his name; of St Clare; and of Metastasio. Assisi has two Gothic churches, one surmounting the other, with frescoes and paintings by Cimabue, Giotto, and other masters; beneath, in a crypt (1818), are the relics of St Francis. Assisi has also a cathedral; the church of Santa Maria was built out of a temple of Minerva. St Clare's convent (St Damian) is close by. Pop. 7000.

Assiut, or ASSIOUT. See SIOUT.

Assize. This word, literally signifying a 'sitting' or 'session,' is a term used in the principal European legal systems, and very much in the same senses in all. As is common with regard to most of our ancient legal technicality, the Latin language, in the first instance (*assideo*), and then the French (*assis*), appears to have led to its introduction into the phraseology of the law of England, and, it may be added, also of Scotland, although in the latter country it has a more limited application in judicial procedure than in England, *assize* being in Scotland the old technical expression for a jury. In England, this word may also signify a jury, and it is sometimes used to denote an ordinance, decree, or law. But in modern practice, it is commonly applied to the sessions or sittings of the judges of the High Court of Justice, held periodically in each county, for the purpose of administering civil and criminal justice. These courts came into use in room of ancient justices in eyre, *justiciarii in itinere*. The Statute of *Nisi Prius*, in the time of Edward I., gave a general jurisdiction in civil business to the judges acting in land disputes under the Assize of Northampton in 1176. They are now appointed by commissions issued twice a year to the judges of the High Court of Justice, two judges being generally assigned to each circuit. These commissioners or judges of assize are sent twice in

every year on *circuits* all round the kingdom to make inquiry into crimes committed in certain counties, and to hear and determine the same according to law, or to try certain civil and criminal cases which are ready for trial; and occasionally a third circuit is appointed for jail delivery. The circuits are eight in number—Northern, North-eastern, Midland, South-eastern, Oxford, Western, North Wales and Chester, and South Wales. The judges or commissioners are authorised to try criminal cases in virtue of (1) a commission of *oyer and terminer*, which applies to prisoners against whom true bills have been found at that particular assize; and (2) a commission of general *jail* delivery, which enables them to try all persons in prison or on bail. A third commission—that of assize—empowers them, *inter alia*, to try civil cases. Incident to this third commission is the jurisdiction to try cases at *nisi prius*—i.e. all questions of fact issuing out of the courts at Westminster that are then ripe for trial by jury. These, by the ancient course of the courts, were usually appointed to be tried at Westminster in some Easter or Michaelmas term, by a jury returned from the county wherein the cause of action arose; but with this proviso, *nisi prius*, unless before the day fixed the judges should come into the county in question, which in modern times they have invariably done in the vacations preceding; so that the trial has always, in fact, taken place before these judges. At least one judge of the High Court goes round each circuit three times a year—in winter, in summer, and in autumn. The circuit system, however, does not extend to London and Middlesex, which have instead courts of *nisi prius*, which are held before the chief or other judge of the superior courts for the trial of civil causes, at what are called the London and Westminster Sittings; and the establishment of the Central Criminal Court has sufficiently provided for the administration of criminal justice within these districts.

The circuit courts of Justiciary in Scotland (now technically sittings of the High Court) resemble the assizes, and have, in criminal matters, a like jurisdiction; but in civil causes their authority is limited to the hearing of appeals from Small Debt Courts, although civil trials by jury in the Court of Session are occasionally set down for circuit. Scotland is divided into three circuits, the North, South, and West. Formerly there were only two courts held in the year, with an additional court at Glasgow. In 1882 it was found necessary, by Act of Adjournment following on Order of Privy Council, to provide for three additional courts in Glasgow, and two additional at Perth, Dundee, and Aberdeen.

In the sense of an ordinance or law, the term assize has various applications, although chiefly in the more ancient systems of jurisprudence. Thus, the 'Assizes' of Jerusalem were a code of feudal laws for the kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons and of the clergy and laity under Godfrey of Bouillon. Then there were in England the Assize of Bread, the Assize of the Forest, the Assize of Clarendon. The word was often applied to particular action connected with land. See also JURY.

Assmannshausen, a village on the Rhine, 3 miles below Rüdesheim, famous for the red and white wine which is produced on the slate-mountains in its vicinity. The red wine (Assmannshäuser) resembles Burgundy, and possesses a rare aromatic flavour. The choicest sort, which is preferred by connoisseurs to all the other red wines of the Rhine, is cultivated in the once ducal (afterwards Prussian) vineyards near Wiesbaden.

Assmayer, IGNAZ (1790–1862), composer, born

at Salzburg, directed the Vienna Tonkünstler-Societat, composed masses, oratorios, and requiems.

Associate Synod, ASSOCIATE PRESBYTERY. See UNITED PRESBYTERIAN CHURCH.

Association. See, besides the following articles, CO-OPERATION, COMPANY, SOCIETIES, LEAGUE, COMBINATION, CONSPIRACY; also ECOLOGY, FOOTBALL.

Association of Ideas was a term first used by Locke for the mental collocations which facilitate recollection—phenomena discussed as early as Aristotle's time. Actions, sensations, feelings, emotions, thoughts, ideas occurring in close succession tend so to cohere that subsequently when one is presented to consciousness the others are apt to arise. Aristotle, dealing with memory, recognised three principles of mental resuscitation—similarity, contrariety, and coadjacency—and in this was followed by many philosophers, though it was disputed whether contrariety was really an independent element, since contraries are relatives which, like father and son, imply one another. Ludovicus Vives, an Aristotelian of the 14th century, was the first to specify in detail the circumstances that determine the adhesive bond of recollection. Hobbes made contiguity the foundation of reminiscence. Hume recognised resemblance, contiguity, and causation. But it may be argued that causation, like order in place and order in time, is but a case of contiguity. Hume made the principles of association into 'laws,' which explained not only how idea follows idea, but how the mind built up its knowledge of the world. Association played a large part in the philosophy of Hartley. Thomas Brown was a severe if not unfair critic of Hartley, and preferred the term suggestion to association; but he also assigned great prominence to the associative principle in sense-perception ('external affections' of mind), and referred all other mental states to the two generic capacities or susceptibilities of simple and relative suggestion. The term 'Associationist school' was given rather loosely to many who, in very various degrees, sought to explain most or even all mental acquisitions and the most complicated mental processes by association, including Hobbes, Hume, Condillac, Hartley, Priestley, James Mill, Bain, and Spencer. Bain sought to refer association and all that depended on it to the two 'laws' of contiguity and similarity.

Many of the writers named kept the psychological as distinguished from the merely epistemological aspect of association in view, and all of them would have repudiated any intention to deal with the matter otherwise than psychologically. And Herbert Spencer insisted further that the psychological fact of conscious assimilation corresponded with the fundamentally simple psychological fact of re-excitation of the same nervous structures. Nevertheless, it must be said that the associationists' way of dealing with the 'laws' of association was epistemological rather than truly psychological, and implied a somewhat mechanical and atomic scheme of the mind and of the way in which the elements of knowledge came together. In recent psychological research it has become usual to refer the associating of ideas to specific groupings of mental processes. Psychology does not suggest, as associationism did, that scraps of consciousness are, as it were, waiting in the antechamber of the subconscious, ready to be associated. Rather it is the conscious or subconscious processes that stand related and become more or less unified; there is no distinct bit of consciousness answering to the associative bond itself—there is probably no actual associative bond. Not till we have made a full analysis of the mind during the associative process,

not till we know all the conditions under which association takes place, not especially till we have measured the time-conditions can we fairly claim to have grasped the problem. Experimental psychology is a comparatively new science, and its work is yet far from complete. But it is definitely ascertained that frequent occurrence, recentness of the experience, vividness, certain relations of place and position, and power to attract and maintain the attention are real conditions of mental association. By reason of frequent repetitions, by reason of recent excitation, and so on, there is a tendency for nervous processes to discharge in certain particular ways. Neural disposition determines the direction of the discharge, and so regulates the appearance in consciousness of the associated items. The process of successive association picks up elements here and drops them there, but is continued by a common thread, now slender and simple, now complex and variegated. The associated elements of consciousness are sometimes multitudinous and confused, sometimes clearly and definitely presented. Sometimes a single element prevails, sometimes a combined strand of two or more streams of influence. The discussion of the so-called 'laws' of contiguity, similarity, contrast has been superseded by the analysis of the contents of the association and the conditions under which the relative processes of consciousness take place. As Professor Stout puts it, 'The basis of all associative connection is the concurrence of distinct experiences in the formation of a single cumulative disposition, which tends to be re-excited as a whole whenever any of the experiences recur which have combined to produce it.' The elements may, of course, be indefinitely modified, but the tendency is to the revival of the total experience exactly as it was formerly experienced. See PSYCHOLOGY, MNEMONICS.

Associations, Trusts, and Cartels.—'Associations' is the official term usually given in Great Britain to those large industrial combinations which are occasionally floated with the object, more or less openly avowed, of eliminating competition and raising prices—in other words, of securing monopolistic profits. The Bradford Dyers' Association, the Bradford Woolcombers' Association, the British Cotton and Wool Dyers' Association, the Calico Printers' Association, and Associated Portland Cement are well-known instances. But with the possible exception of the famous Coats' company, which has beaten or absorbed nearly all competitors in the manufacture of sewing cotton, there is no example in Great Britain of any capitalistic company in any competitive business having succeeded in permanently raising the prices of its products above their natural level, or of extracting what may be called monopoly profits from the consumer. Of course there are a number of natural local monopolies in this country, as in other countries, such as gas and water, which are sold to consumers at fixed prices under private Acts of Parliament by water companies or by municipal corporations and urban district councils. But this is quite another matter. In a country which has no protective tariff, monopoly prices for ordinary articles cannot be imposed, because, even if by huge combinations it were possible to eliminate home competition, the competition of foreign goods would make monopoly prices impossible. The only case in England of an artificial monopoly fostered and maintained by the law is provided by the trade in alcoholic liquors. Here we find that in most districts the retailing of beer and spirits is confined to licensed houses, nearly all of which are 'tied' to some particular brewery. A brewery buys licensed houses, and then puts in a tenant, who is bound or 'tied' to sell only the beer of his

landlord, the result being that a monopoly price can be obtained, or (as most frequently happens) an inferior and adulterated beer can be sold at the ordinary price.

But the liquor trade is the exception which proves the rule. For, of course, no one denies that monopolies can be created by the state. They were so created in the reigns of Elizabeth and James the First by royal grants or patents to courtiers and favourites. But these abuses were abolished by the statute of monopolies which restricted such grants to patent rights. Patents and copyrights are the rewards of inventors and authors, while trade-marks are for the protection of manufacturers and traders who have made a reputation as makers of, or dealers in, some particular article. Patents and copyrights are only allowed for a term of years; but by a very proper reciprocity, the property in a book or invention has now been extended to other countries; so that these rights and privileges may be said to possess an international sanction.

In order to see the baneful effects of those monopolistic 'associations' which come within the scope of this article, it is necessary to turn to other countries, more especially to the United States and Germany. The United States is the classic land of 'trusts,' which have now flourished for thirty years or more under a system of high protection. It was under the shelter of tariffs originally imposed for revenue during the civil war between north and south that the American trusts sprang up. But as these mighty combinations of capitalists found themselves enriched by the tariff, they began to 'log-roll' in the Congress and the Senate for a higher and a higher tariff on the articles in which they were interested. And with such success that an ingenious writer once published what he called *The United States Tariff for Trusts*, showing the percentage obtained by the iron and steel kings, the woollen and worsted magnates, the coal kings, and beef barons, the sugar lords, the tobacco trust, &c. Mr Havermeyer once frankly avowed that the American tariff is the 'mother of trusts;' but hitherto every effort to strike at the root of the trouble has been unavailing, owing to the corruption by vested interests of more than half the Senate and Congress. Hence the Payne-Aldrich Tariff of 1909 was practically as high as its famous or infamous predecessor the Dingley Tariff. The only important American trust which has succeeded in imposing monopoly prices without much assistance from the tariff is the Standard Oil Trust, the unique organisation of Mr Rockefeller, which gradually acquired practically all the oil resources of the United States, and engrossed almost the whole of the oil trade in all its branches. This is the leading case of a more than national monopoly attained by the skilful and relentless use of the money power. The next analogy is the United States Steel Trust, which now possesses an enormous share, not only of the iron and steel plant, but also of the iron ore and coal-mines of the United States. But the fortunes of Mr Carnegie and of the other steel kings came very largely out of the pockets of the American tax-payers. The principal reduction of the Payne Tariff (1909) was in the iron and steel schedule, and was made on the representations of Mr Carnegie, who declared at the tariff hearings that the iron and steel industry did not require any protection. Next to the tariff, the most potent source of trust power and profit lay in the manipulation of railroad rates. The directors of the trust corporations and of the railroad corporations were often identical. In one of the many cases which came before the courts, it was proved that a railroad company in Ohio was charging the Standard Oil Company a 10 cent. rate and an independent

competitor a 35 cent. rate for carrying oil the same distance under the same circumstances. Probably even Mr Rockefeller's genius could not have established the oil monopoly but for this corrupt alliance with the railroads of Pennsylvania and Ohio.

These scandals at length led to the passing of the Sherman Anti-Trust Act of 1890, which made illegal 'every contract and combination, in the form of a trust or otherwise, in restraint of trades or commerce among the several states or with foreign nations.' Under this act an enormous number of prosecutions have been at various times undertaken, and the system of preferential rates on American railroads has been checked, if not wholly suppressed. The legal form of trust seems to have been first devised by the Standard Oil Company, which was formed in 1882. A trust is a combination of corporations or companies, and takes the form of a surrender by the stockholders of the various corporations entering the trust of their separate holdings to a board of trustees, who receive an irrevocable power of attorney, and issue in return trust certificates representing equitable shares in the combined properties. Thus the business of all the combined corporations is concentrated under the management of the trustees, and the pooled profits are distributed to the holders of the certificates in proportion to their holdings. This was the original organisation; but now, to meet hostile legislation, many trusts have returned to the corporation form—an easy transformation, for it is only necessary to issue to each holder of a trust certificate a corresponding amount of stock in the new corporation. On the score of industrial efficiency, the American trust presents many disadvantages, and in periods of crisis, such as 1903 and 1907, many trusts, as well as many ordinary corporations, have gone into the hands of receivers. Perhaps the most notorious failure was the Atlantic Shipping Trust, incorporated under a New Jersey Charter in 1902, with the official title of the International Mercantile Marine Company. This has been wittily described as an attempt to 'Morganise' the ocean, Mr Pierpont Morgan having been in fact the promoter of the scheme. Five English shipping lines, comprising 118 large steamers, were bought up, and the London yellow press predicted the end of our maritime supremacy. The trust was financed by a share capital of 120 million dollars and a debenture capital of 50 million dollars. The capital and the board were at first predominately American. But it soon turned out that the ships had been bought at excessive prices; the American capitalists retired with loss, and the English resumed control, buying back cheaply what they had sold dear. It should be added that in 1903 the United States Shipbuilding Trust went into a receiver's hands.

The characteristic difference, it has been said, between the American Trust and the German Cartel (in German, *kartell*) is as follows: Whereas the trust is a combination in which the individual firms or companies combined are entirely merged and absorbed, the creation of a *kartell* only combines the firms into a syndicate for certain purposes, allowing the individuality of its members to continue so far as is consistent with the business policy of the federation. *Kartells*, like trusts, are organised to eliminate competition and raise home prices above the level which would be possible under competition. Here the tariff comes in. No English combination has yet been able to raise home prices above the level current in neutral markets. If it did, the article would be imported from abroad, and the price level would fall. But many of the German, Austrian, and other foreign *kartells* (notoriously the sugar syndicates previous to the Brussels con-

vention) have made it their policy to sell at very low prices abroad that part of their stock for which they could not obtain monopoly prices in the home market. This can be done, because the home market is 'protected' by a high tariff wall. The price within the wall is almost always a little higher than the national or international price *plus* the duty.

The business of the *kartell* is not to direct and manage the process of manufacture, but to sell the products of the combination. For this purpose a pool or fund is frequently created out of the home profits in order to sell surplus products abroad at a loss. Thus the exports of a German *kartell* are bounty fed out of the excessive prices charged to German consumers. One extraordinary case quoted is that of coke, for which German consumers were at one time charged 17 marks per ton, while Austrian buyers got the same quality at 8 marks. Similarly in 1900 the wire *kartell's* price in Germany was 185 marks, and abroad 115 marks per ton. In the bad times of 1900-2, the nail syndicate sold at 250 marks per ton in Germany and at 140 marks abroad. There is no space to multiply examples, but enough has been said to show why the *kartells* are almost as unpopular in Germany as are the trusts in the United States. Outside these regular organisations—trusts, *kartells*, associated companies, or syndicates—there are also, of course, innumerable other arrangements, often of an informal or temporary character, by which capital seeks to extract monopoly profits from the consumer. Private agreements between railway companies in cases where amalgamation could not be legally carried out are known in Great Britain. Merchants and passengers by sea often find to their cost that apparently competing lines have entered into a shipping 'ring.' Buyers or sellers, especially speculators in particular markets, often find that they have been 'cornered.' But by whatever name these arrangements and associations go, they are all characterised by the same purpose—monopoly.

Y., 4th ed. 1903); the writer of the preceding article, F. W. Hurst, *Monopolies, Trusts, and Kartells* (1905); Levy, *Monopole, Kartelle, und Trusts* (1910).]

Assoilzie ('assoil,' 'absolve'), a Scots law term meaning to absolve from a claim, or acquit.

Assolant, ALFRED, French author, was born in 1827 at Aubusson, Creuse, and became a teacher in Paris. In 1852 he visited the United States, and on his return published some brilliant sketches, as *Scènes de la Vie des Etats-Unis* (1859). From his pen now came a long series of tales and novels, including *Branças* (1859), *Marcomir*, *Gabrielle de Chênevert*, *Les Aventures du Capitaine Corcoran*, *François Buchamor*, *Pendragon* (1881). He was equally notable as a sarcastic and powerful journalist and political writer, bitterly assailing the empire and the opportunist republican government. He died in May 1886.

Assonance, in Prosody, is the correspondence of sound pronounced by a reiteration of the same accented vowel with different consonants, as in *nice* and *might*, *war* and *fall*, *mate* and *shape*, *feel* and *need*. It is a kind of imperfect rhyme, or rather a substitute for rhyme, and is especially common in Spanish poetry. All the old French poetry also was marked by assonance, not rhyme. 'The rule of assonance,' says Marsh, 'requires the repetition of the same vowels in the assonant words, from the last accented vowel inclusive. Thus *man* and *hat*, *nation* and *traitor*, *penitent* and *reticence*, are assonant couples of words of one, two, and three syllables respectively.' In Spanish verse the assonance is generally introduced only in alternate verses or the

second of each couplet. Assonant or vowel rhymes occur frequently in modern English poetry.

Assos, a ruined town on the Gulf of Edremid, from the still imposing remains of which the successful excavations, in 1881-83, of the American Institute of Archaeology have brought to light the agora, with senate-house and colonnade, a bath, theatre, gymnasium, statues of heroes, and seven Christian churches.

Assuan (also *Asuan*; the ancient *Syene*) is the southernmost city of Egypt proper, on the right bank of the Nile, and beside the first or lowest cataract. Near are the islands of Philæ and Elephantine. On the left bank are catacombs. There are some remains of the ancient city. Near by are quarries of granite (the name—though not the rock—Syenite (q.v.) comes from Syene) from which huge obelisks and statues were cut to adorn the temples and palaces of ancient Egypt. Assuan (or Aswan) is capital of a district and headquarters of a commandant. Pop. 11,000.

The great Nile irrigation system, commenced in 1898, includes a dam at Assuan and barrages at Esna, Assiut, and Zifta. Assuan dam, opened by the Duke of Connaught on 10th December 1902, was designed to raise the level of the Nile for 140 miles above the first cataract, its total length being $1\frac{1}{2}$ mile, the maximum height from the foundation about 130 feet, and the total weight of masonry over one million tons. The difference of level of the water above and below was 67 feet, navigation being provided for by a series of four locks, each 260 feet by 32 feet. The dam was pieced with 180 openings, 20 feet by 6 feet, capable of discharging 15,000 tons of water per second. In 1907 it was resolved to heighten and thicken the dam. On 23rd December 1912 the Khedive laid the last stone of the extension, which cost £1,520,000; £320,000 being allotted to expropriated villagers and to the Antiquities Department for research in the area to be submerged, which included Philæ (q.v.). The dam's storage capacity was increased from 980,000,000 to 2,420,000,000 cubic metres. The water-level was raised 23 feet, the masonry 16'4 feet. The enlarged dam brings over 6,000,000 acres within cultivation (2,500,000 acres thereof under summer crops in normal years). By drainage of the Delta, and by pumping in Upper Egypt, vast additional areas are being reclaimed; a dam on the White Nile near Gebel Auli, above Khartum, is proposed, to increase the storage for summer and provide against inundations; and regulation of the Nile at the Great Lakes may yet be undertaken. See EGYPT, IRRIGATION, NILE.

Assumpsit, an action wherein the plaintiff asserted that the defendant undertook (*assumpsit*) to do a certain act, and failed to fulfil his promise; in form an action for trespass, but really for recovery of damages for breach of a simple contract (a promise not under seal). Both in Britain and in most of the United States this and other common-law forms of action have been superseded by statute.

Assumption, or ASSUMPTION OF THE VIRGIN, a festival instituted as early as the 6th century both in the East and in the West. In the 3d century we first meet with a Gnostic tradition, that, after the death of Mary, her soul and body were taken up to heaven by Christ and his angels. That legend was condemned by Pope Gelasius (494 A.D.), but, through a series of successful forgeries, it was fathered on SS. John, Athanasius, Augustine, and others, and by 590 was accepted as true by Gregory of Tours. The festival is kept on the 15th of August (see MARY). The word assumption might be used of Enoch and of several saints, but

is generally understood of Mary alone. The assumption in this sense has been made the subject of pictures by Titian, Correggio, Murillo, Rubens, and many other famous painters; and several minor orders, fraternities, and sisterhoods call themselves after the miracle—as the Augustinians of the Assumption and the Little Sisters of the Assumption.—For Assumption, the capital of Paraguay, named after the festival, see ASUNCION.

Assumptionists, or AUGUSTINIANS OF THE ASSUMPTION, a congregation founded at Nîmes in 1843 by Father Emmanuel d'Alzon, vicar-general of that diocese, were organised in 1847, and formally approved in 1864. Their main objects were to combat irreligion in Europe and schism in the East; and with these ends in view the brethren devoted themselves to catholic higher and secondary education, to the spread of truth by the press, to the conduct of pilgrimages, and to missionary work in the East. Their 'bonne presse,' especially its paper *La Croix*, was charged by the French government with hostility to the republic and with monarchial aims, and the congregation was suppressed within French territory in 1900. Many Assumptionists came to England, but some remained, at home as secular priests. Their press was bought by a manufacturer of Lille, and is still zealously carried on. The Assumptionists follow the rule of St Augustine, and have the same privileges, breviary, and habit as the Augustinians. Father d'Alzon also established the 'Ladies of the Assumption,' who promote the education of the upper classes and the adoration of the blessed sacrament. One of his first disciples founded the 'Little Sisters of the Assumption,' who visit the sick poor in their own homes. Amongst Bulgarians, Greeks, and Armenians the Assumptionists employ the oriental rite (Greek or Slav).—An older congregation of French nuns, the 'Sisters of the Assumption,' founded in 1839, educates young girls.

Assur, or ASHUR, early capital of Assyria; also a name of the country itself and of its chief god. See ASSYRIA.

Assurance. See INSURANCE.

Assur-ban-i-pal, or SARDANAPALUS See ASSYRIA.

Assur-nazir-pal. See ASSYRIA.

As'synt, LOCH, a beautiful fresh-water lake of South-west Sutherland, $6\frac{1}{2}$ miles E. of Lochinver. Lying 215 feet above sea-level, it has an extreme length and breadth of $6\frac{1}{2}$ miles and $\frac{3}{4}$ mile. N. of it rises Quinag (2653 feet); E., Benmore Assynt (3273); S., Canisp (2779) and Sulven (2399).

Assyria (called *Assur* and *Asur* in the Assyrian inscriptions; *Athura* in the Persian) was the northernmost of the three great countries that occupied the Mesopotamian plain. It was bounded on the N. by the Niphates Mountains of Armenia; on the S. by Susiana and Babylonia; on the E. by Media; and on the W., according to some, by the Tigris, but more correctly by the watershed of the Euphrates, for many Assyrian ruins are found to the west of the Tigris. It was thus about 280 miles long from N. to S., and rather more than 150 broad from E. to W. This plain is diversified by mountain-chains on the north and east, and watered by the Tigris and its affluents, between two of which—the Zab rivers—lay the finest part of the country, called Adiabéné. Its extraordinary fertility enabled it to support a large population. The high degree of prosperity and civilisation reached by its inhabitants in very early times is attested not only by ancient writers, but by the extensive ruins of mighty cities, by the canals and contrivances for irrigation, and by the numerous proofs—furnished by excavation—of acquaintance

with the arts and sciences. The ruins of many cities are grouped around Nineveh; while lower down, the Tigris exhibits an almost unbroken line of ruins from Tekit to Bagdad. Under the Mohammedans this fine country is now almost a desert.

It received its name from its first capital, Asur, or Assur, now *Kalah Shergat*, on the east bank of the Tigris, between lat. 35° and 36°. The city seems to have been founded by the Mitannians, a people allied to the Hittites, and was governed by high-priests. The later capital, Nineveh, now *Kuyunjik*, opposite *Mosul*, originally grew up round a temple of the goddess Istar, and owed its importance to the fact that it was on the commercial high-road to the silver and copper mines of Cappadocia. Calah, now *Nimrud*, at the junction of the Tigris and Upper Zab (or Lycus), was founded about B.C. 1300, and for a time was the chief seat of government.

Productions.—Stone was plentiful, more especially a species of alabaster; while iron, copper, and lead were found in the neighbouring mountains. The hills were covered with pines, oaks, and planes; figs and olives grew in the plain. The vine had been introduced from Armenia. Wheat, barley, millet, hemp were cultivated. Animals were numerous, both wild—lions, panthers, bears, bulls, stags, gazelles, hares, &c.—and domesticated—cattle, goats, sheep, dogs, asses, horses, and camels.

History.—Before the decipherment of the inscriptions our knowledge of Assyrian history was dependent on a few Biblical notices and the legends to be found in classical writers. The Assyrian history of Ctesias of Cnidus (court-physician to Artaxerxes Mnemon, B.C. 405) is little more than the Greek form of a Persian romance, and the references to Assyrian history in his rival Herodotus are not much more trustworthy. Ninus and Semiramis, Ninyas and Sardanapalus, though an historical background may possibly lie behind them, are all alike legendary. Apart from the quotations from Abydenus and Berossus preserved in Greek Christian writers, classical antiquity has handed down to us little except myth and fable.

Chronology.—Assyrian chronology rests upon the so-called Eponym Canon—that is, lists of the successive *limms*, or officials, who gave their names to the years in which they held office. As the date of the official year of one of them is fixed by a solar eclipse, we possess an exact register of time from B.C. 913 to 659, the period covered by the lists that have been preserved. The institution of reckoning time by the names of a successive series of officials went back to at least B.C. 2000. For the period before B.C. 913 we are dependent on the dates assigned in the later inscriptions to the reigns of earlier kings or high-priests: thus Sennacherib states that Tiglath-pileser I. was defeated by the Babylonians 418 years before his own conquest of Babylonia (B.C. 689), and that Shalmaneser I. lived about 600 years before himself. Other sources of chronology are the *Synchronous History of Assyria and Babylonia*, which gives an account of the relations between the two countries, and the *Babylonian Chronicle*, which in its later part throws much light upon Assyrian history.

Monumental History.—Assyrian history begins with the Mitannian high-priests of Asur, who, after the Semitic occupation of the country, made way for Semitic rulers. From Gen. x. 11 it would seem that the leader of the Semitic invaders was Nimrod, whose name, however, has not been found on the monuments. In any case the Assyrians of history were a body of military adventurers from Babylonia, who brought with them the language, laws, customs, and religion of their native land. The name of Nineveh may imply that some at least of them came from a city of similar name in

Babylonia, where the goddess Istar was worshipped under the name of Nina. Up to the last Assyria remained a military state; whereas in Babylonia the population was mainly agricultural or commercial, and the government was largely theocratic in character, in Assyria the army was predominant, and its general was the ruler of the state. A result was the frequency of revolutions, which ended by placing a successful general on the throne. The whole nation seems to have been trained to arms, and the national deity was a war-god.

For several centuries, however, the high-priests of Asur were subjects of the Babylonian king. When the Babylonian dynasty of Khammu-rabi fell after an invasion of the country by the Hittites, the Assyrians succeeded in asserting their independence during the troublous period that followed. Their first king may have been Bel-kababu, who, according to Shalmaneser I. (B.C. 1300), lived 580 years before himself. From this time onward there were constant wars between Assyria and the mother-country, interrupted at times by treaties and even intermarriages, as when the Babylonian king married the daughter of Assur-uballit, king of Assyria, about B.C. 1400. The marriage proved disastrous to the Babylonian king, who was murdered. Assur-uballit, however, avenged his death, and placed his own great-grandson upon the Babylonian throne. Letters of his to the king of Egypt have been found at Tel-el-Amarna.

Babylonia and the Hittites now combined against the growing power of Assyria, and the league was subsequently joined by Egypt and Mitanni. Mitanni (Mesopotamia), however, was compelled to submit to Assyrian rule, and the overthrow of the Hittite empire in the 13th century B.C. left Babylonia defenceless. Shalmaneser I. (B.C. 1300) carried his arms far to the north and west, reducing the Aramæan tribes to obedience, and made Calah his capital, while his son, Tukulti-Ninip I., captured Babylon, and for seven years reigned there as lord of the eastern world. A revolt finally forced him to retreat to Assyria, where he was murdered, and his dynasty came to an end a few years later in the person of Bel-kudur-uzur. His successor, Ninip-pileser, seems to have founded a new line of kings, the fifth of whom, Tiglath-pileser I., was one of the greatest of Assyrian conquerors (B.C. 1100). He extended the dominion of Assyria from the frontier of Elam to the Mediterranean, overran the mountainous region to the north, and boasted of having killed a dolphin in the western sea. At Arvad he received presents from the Pharaoh of Egypt, which included a crocodile and a hippopotamus. He enlarged the palace at Calah, and repaired the great temple of Anu and Hadad at Asur. Under his successors, however, the military strength of the empire decayed; the western conquests were lost, and the Aramæans blocked the road to the Euphrates. This period of decay is synchronous with the rise and rapid development of the Hebrew monarchy under David and Solomon.

With Assur-nazir-pal II. (B.C. 884-859) a new era of conquest commenced. Year after year the Assyrian army marched out of the capital in pursuit of booty and slaves. Mesopotamia was recovered, the Assyrian forces found their way to the Phœnician coast, and the mountaineers of the north-east as far as Lake Urumiyeh were compelled to pay tribute. Shalmaneser II., Assur-nazir-pal's son and successor (B.C. 858-824), whose annals are engraved on the Black Obelisk from *Nimrud*, now in the British Museum, continued the conquests of his father. Before he died Assyria was mistress of Western Asia. The merchants of Assyria, whose trade had formerly been chiefly with the north-west, now looked covetously on the commercial wealth of the Phœnician cities, and Shalmaneser,

accordingly, made every effort to possess himself of the Mediterranean coast. But the Syrians of Damascus stood in the way. Campaign after campaign was therefore directed against Ben-Hadad and Hazael, and in B.C. 854 the Syrians with their allies were defeated in a battle at Qarqar, on the Orontes. Among the allies was Ahab of Israel, who had contributed 2000 chariots and 10,000 foot-soldiers to the confederacy. Twelve years later (B.C. 842) Syria was again invaded, and Hazael was defeated on the heights of Shenir (or Hermon, Deut. iii. 9), with the loss of 1121 chariots. Shalmaneser then besieged Damascus, cutting down the trees which surrounded it, and after marching into the Hauran, returned to the coast, where he caused an inscription to be engraved at the mouth of the Nahr-el-Kelb, near Beyrout. Here he received tribute from Tyre, Sidon, and 'Jehu, the son of Omri.' The Israelites, who are pictured on the Black Obelisk, are said to have brought 'silver, gold, a bowl of gold, a cup of gold, golden goblets, golden pitchers, lead, a sceptre, and bdellium (?)'. Shalmaneser's latter years were troubled by the rebellion of his son, which, however, was eventually suppressed.

His grandson, Hadad-nirari IV. (B.C. 810-782) resumed the work of subjugating the west. Damascus surrendered to his arms, and its treasures were carried to Assyria, and Hadad-nirari claims to have conquered 'Tyre, Sidon, the land of Omri, Edom, and the Philistines.' As Judah is not mentioned, it appears to be included in 'the land of Omri,' or Israel; according to 2 Kings, xiv. 13, Jerusalem had been taken by Jehoash, and Judah was now a dependency of Israel. Hadad-nirari must be 'the saviour' referred to in 2 Kings, xiii. 5.

In the year 763 B.C. the Assyrian eponym canon records the observation of a solar eclipse in the month Sivan, which is now identified as that of the 15th of June. This eclipse forms the pivot-point on which Assyrian chronology turns. The empire now began to display signs of weakness, and when Assur-nirari ascended the throne in 753 B.C. there were many indications of a spirit of revolt. This is indicated by the statements in the eponym canon. Arpad in Syria revolted, and for four years the army remained at home, owing no doubt to the disturbed state of the country. An attempt was then made to repress the revolts in Namri or Kurdistan, which apparently failed, for in the year 746 B.C. we have a revolt in Calah, which indicates a rebellion of the army, followed by the usurpation of the throne in 745 by Pulu or Pul, a Babylonian who assumed the Assyrian name of Tiglath-pileser IV. Like his early namesake, he proved the saviour of the nation, and at once instituted an entirely new system of government of the provinces of the empire. In former times it was conquest and spoil rather than annexation and annual revenue that formed the policy of the rulers of Assyria. Tiglath-pileser IV., however, introduced a new system into the government, that of centralisation. Conquered districts were now annexed, and became satrapies ruled by Assyrian officials, and responsible for a fixed yearly revenue to the central government. The leaders of the national party in these regions were removed to Assyria, and their place supplied by bands of colonists from other regions, as in the case of Samaria, Arpad, and Hamath. Another chief aim of the new sovereign was the control of the great commercial centres in Western Asia. Thus Carchemish and the cities of Phœnicia were objects of campaigns to secure the trade-route through Syria. In 742 B.C. Arpad revolted and was besieged for two years by the Assyrians, and its subsequent fall brought about the conquest of North Syria. Hamath, then in alliance with Azariah, king of

Judah, was taken by storm, and the kings of Syria hastened to pay homage to the conqueror. Among the names of those who waited on him we find Menahem, king of Samaria, Rezin of Syria (Damascus), Hiram of Tyre, Pisiris of Carchemish. This was the campaign referred to in the Scriptures (2 Kings, xv. 19), when Menahem gave a thousand talents of silver to Pul, king of Assyria (B.C. 738). The successful war in Syria and Palestine was followed by campaigns in Armenia on the shores of Lake Van. The Assyrians next appear in Syria as the allies of Ahaz, called Yahukhazi or Jehoahaz by the Assyrian scribes. The result of this campaign was the siege of Damascus and the ravaging of the kingdoms east of Jordan. The fall of Damascus (B.C. 732) made Syria a province of the court of Nineveh, and the tribute-lists discovered by Sir Henry Layard at Nineveh show Carchemish, Damascus, Arpad, Arvad, Hamath, Tyre, Sidon, and Samaria as contributing a regular sum to the national revenue. Having reduced the west to submission, the Assyrian king now attacked Chaldea, and after a severe war, commencing in 731 B.C., he defeated and slew Ukin-ziru, the Kinziros of the Canon of Ptolemy, and was proclaimed king of Babylon in 729 B.C.

This important reign ended abruptly in 727 B.C., and a military commander, Shalmaneser IV., seized the throne. He made an ineffectual attempt to capture Tyre, and after imprisoning the king of Israel, Hoshea, who had attempted to revolt, he laid siege to Samaria (B.C. 725). In B.C. 722 he died, or was murdered, and another usurping general, Sargon, was crowned king. Sargon continued the war in Syria, and in 722 B.C. captured Samaria, carrying away 27,280 of the leading inhabitants, and placing them in the province of Gozan, near the Khabour, and in Media. The latter days of the reign of Tiglath-pileser IV. evidently had been marked by a general revolt of the provinces, which Sargon had to reconquer; and in the battle of Raphia on the borders of Egypt, which terminated the war, he checked the advance of the Egyptians under Sabako. In 717 B.C. the Hittite capital, Carchemish, fell, and produced the rich spoil of 'eleven talents, thirty manehs of gold, and two thousand one hundred talents of silver.' All this time the intrigues of Merodach-baladan III. in Chaldea were causing trouble, but the disturbed state of the other provinces still kept Sargon from the object he most desired—the conquest of Babylon. In order to delay the attack, Merodach-baladan sent his embassy to Hezekiah, and raised a revolt in Syria, in which Phœnicia, Moab, Edom, and Philistia, supported by the Egyptians, took part. Sargon besieged Jerusalem and burned Ashdod (Isaiah, xx. 1). Having quelled the revolt, Sargon invaded Babylonia, and after a terrible campaign captured the capital, Merodach-baladan taking refuge in flight, and was proclaimed king 710 B.C. Tablets dated in his reign as king of Babylon are preserved in the British Museum. Sargon built for himself a magnificent palace called *Dur Sargon*, 'Fort Sargon,' marked by the ruins at Khorsabad, about 15 miles from Nineveh. This palace was explored by M. Botta for the French government, and the fine sculptures from it form one of the treasures of the Louvre. The bas-reliefs, sculptured figures, and architectural decorations of this palace show a new departure in Assyrian art, and indicate foreign influence. Sargon was killed during a revolt of the soldiers in the new palace on the 12th day of the month Ab (July) 705 B.C., when his son, Sennacherib, succeeded him. The Babylonian revolt on the death of Sargon led to the return of Merodach-baladan, but nine months later he was defeated by the Assyrians in the battle of Kisu.

At the same time a revolt broke out in Philistia, and the people of Ekron, having deposed the Assyrian nominee Padi, sent him for security in chains to Hezekiah, king of Jerusalem, who placed him in prison. This brought on the Jewish king the vengeance of Sennacherib. Having conquered Phenicia, he marched against Ekron, where he punished the chief priests and Philistine lords who had broken their oaths to Assyria. Taharka of Ethiopia, called Tirhakah in the old Testament (2 Kings, xix. 9), who had marched from Egypt to the help of Hezekiah, was defeated at Eltekeh, and Sennacherib proceeded to ravage Judæa, capturing forty-six cities, chiefly in the hill-country, and then advanced to Jerusalem. Here he states he

shut Hezekiah up in the capital 'like a bird in a cage.' There is no indication in the inscriptions how long this siege lasted, and the meagre account of this event in the campaign, and the remarkably abrupt termination of the narrative, seem to indicate that the siege terminated in a disaster to the Assyrian arms. The tribute paid by the king was sent by an envoy to Nineveh, not paid on the surrender of the city; and this, together with the fact that Sennacherib never again entered Palestine, goes to confirm the statements of the Hebrew writers.

Sennacherib's endeavours to govern Babylonia were unfortunate. His viceroys were driven out of the country, which revolted against him time after time with the help of Elam. But the battle

Sennacherib at the Head of his Army. (Height, 38 inches; in British Museum.)

of Khalulê in B.C. 691 disheartened the allies, and after two more years of struggle Babylon was taken by storm in B.C. 689 and razed to the ground. The deed excited horror throughout Western Asia, and the Babylonians saw in the subsequent murder of its perpetrator the vengeance of their god Merodach. The Assyrian forces were also engaged in Cilicia, where a revolt led to the capture and rebuilding of Tarsus and an engagement between the Assyrians and the Ionian Greeks.

The statement as to the murder of Sennacherib by his sons meets with confirmation from the inscriptions. In the Babylonian canon we are told that on the 20th of the month Tebet (December) 681 B.C. the king was slain by one of his elder sons, who was perhaps jealous of the favour shown to his younger brother Esar-haddon, who was at the time serving with the army. Seven weeks later Esar-haddon overthrew his brothers, together with their ally Rusas II., king of Armenia, at Malatiyeh in Cappadocia, entered Nineveh in triumph, and placed himself upon the throne. Though the most active general of his father, Esar-haddon was far more than a mere warrior. He possessed great political tact, and at once inaugurated a new policy with regard to Babylon. He divided the court between Babylon and Nineveh, residing at the former place during the winter, at the latter during the summer months. It was during one of these periods of the winter court at Babylon that Manasseh was brought there prisoner (2 Chron. xxxiii. 11). A son of Merodach-baladan had attempted during the period of anarchy to seize the throne of Babylon, but being defeated, he fled to

Elam, where he was put to death by the Elamite king, who wished to preserve the friendship of the king of Assyria. In 675 the Assyrian king commenced one of the most important wars in the whole period of Assyrian history—namely, that which resulted in the subjugation of the powerful kingdom of Egypt to the Assyrians, and left most of the ancient world under one rule for twenty years. After the war had been waged with varied success for more than three years, the Assyrian king made a great effort to terminate it. A very powerful army left Nineveh the first day of the year, and took the road to Egypt. The march occupied three months, and after the Assyrians had reached the Egyptian strongholds a series of battles was fought, resulting in the retreat of the Egyptians to Memphis, which was captured by the Assyrians on the 22d of Tammuz (June), whereupon the Ethiopian king of Egypt, Taharka, fled up the Nile. Esar-haddon returned by way of the coast of Syria, receiving *en route* the tributes of the Phœnician and Greek kings of Cyprus, and the Philistine, Moabite, and Israelite rulers. In commemoration of this successful campaign, the king had his statue carved on the rocks at Baal-Rasi (Nahr-el-Kelb). Before leaving Egypt the Assyrian king divided the newly conquered land into twenty satrapies, ruled by prefects subject to the court of Nineveh.

The Egyptians did not long remain quiet after the departure of the main body of the Assyrian army; for Taharka returned from the Upper Nile, and the Assyrian king had once more to prepare for a campaign in the Nile Valley. He had already

solemnly appointed his son, Assur-bani-pal, his successor on the 12th Iyyar (April) 669. Six months later, during the campaign, on the 12th Marchesvan (October), Esar-haddon died while on the march to Egypt. Assur-bani-pal had all the ambition but lacked the military genius of his father. He was a generous patron of art and letters, and his reign was the culminating point of Assyrian splendour. He continued the Egyptian war, and drove Taharka from Memphis to Thebes, which city he captured and stripped of its treasures. Phœnicia was next invaded, and Tyre captured, after a siege lasting some months. Campaigns in Elam and in Northern Arabia next occupied the army. The empire was now shaken by one of the most serious revolts ever raised against the government. Acting, probably, on the advice of his father, Assur-bani-pal had appointed his brother, Samas-sum-yukin (the Saosduchinos of the Canon of Ptolemy), viceroy of Babylon, who, taking advantage of the absence of the Assyrian armies in various lands, rose in revolt, aided by the Elamites, Arabs, and by the Egyptians under Psammetichus. The revolt lasted more than five years, but at last Babylon, Borsippa, Sippara, and Cuthah were besieged and taken, and fire, sword, and pestilence spread through the land. The rebellious prince burned himself in his palace with many of his followers.

This revolt, however, shook the foundations of the empire, and soon the vast fabric began to totter. Egypt declared her independence, Syria was in revolt, Elam and the north-eastern provinces refused tribute, and eventually, after the death of Assur-bani-pal, the viceroy of Babylonia, Nabopolassar, father of Nebuchadrezzar, openly threw off all semblance of his allegiance and declared himself king. Assur-etil-ili-yukinni succeeded his father, Assur-bani-pal, 625 B.C. He rebuilt the palace of Calah, and bricks bearing his inscriptions have been found there. The last Assyrian king was Sin-sar-iskun, or Saracos, who was overthrown and Nineveh destroyed by Cyaxares of Ecbatana in B.C. 605.

Assyria became a Median province, and subsequently part of the Persian empire. In 331 B.C., at Gaugamela, near Arbela, east of the Tigris, Alexander defeated Darius Codomannus, the last of the Achemenian Persian kings. In 312 B.C. the country became part of the kingdom of the Seleucids, whose capital was Seleucia, on the Tigris. On the rise of the Parthian power it passed under Parthian rule, and was more than once temporarily in the possession of the Romans. When the Persian monarchy of the Sassanids was destroyed by the successors of Mohammed, Assyria became subject to the Khalifs. From 1638 till the Great War it formed part of the Turkish empire.

Government.—The government during the early and middle empires was a pure despotism and rule by force of conquest, held together by the obligations of tribute and homage; but no centralisation existed. In the reign of Tiglath-pileser IV., an extensive system of central government with the accompaniment of bureaucracy was introduced. In conquered lands the native rulers were either removed and replaced by Assyrian governors, or a resident was placed beside them. Tributary cities were ruled by prefects (*pikhate*) and sub-prefects. Revenue was levied by collectors from all towns and districts, and an annual present from the native princes. In home government the Assyrians modelled their system on that of Babylonia. Taxes were levied on all produce from towns and villages, and tithes for the temple revenues. Special taxes were levied for the army, the river-flotilla, and the maintenance of the royal roadways. Justice was administered by appointed judges, the courts being held in the temples or in the city gate, with the

right of direct appeal to the king. The king had absolute power over life and death, and offenders were treated with the greatest cruelty; impalement, decapitation, mutilation, and burning by fire were the punishments inflicted. The king was feudal lord of all land, and could grant or take away any estates except those of the temples. Public works were carried out by *corvée* (forced bands of labourers) and captive-labour, provisions for the workmen being furnished by the state.

Religion.—The religion of Assyria was of Babylonian origin, with an important exception. Assyria was a military monarchy, and the king was at the head of the state. Whereas in Babylonia the priest took precedence of the king, in Assyria the king was himself the high-priest. The supreme deity of Assyria, accordingly, was a warrior-god, and, like the king, a leader in war. Originally he bore the title of Asiu, or 'Leader,' his female counterpart being Asiāt, the Asheiah of Canaan. Asiu, however, subsequently became confounded with the defeated city of Asur, or Assur, and so came to represent the state. One result of this was that he ceased to be regarded as having a wife or son, and thus occupied a position similar to that of the national God of the Hebrews;

The Guardian Spirit or S'edu.

another result was that the enemies of Assyria were enemies also of Assur, and were punished consequently as heetics. The other deities of Assyria were borrowed from Babylonia, including Merodach, the paternal god of Babylon. But their worship in Assyria seems to have been chiefly confined to the literary classes, with the exception of the goddess Istar, who had temples and oracles at Nineveh and Arbela, and was adored there as the goddess of war, rather than of love, as was the case in Babylonia. The architecture of the temples and the religious ceremonies practised in Assyria, as well as the theological beliefs of the people, came from Babylonia, together with the religious literature connected with them. For Assyrian religion, therefore, apart from the cult of Assur, the article on BABYLONIA must be consulted.

Ethnology.—The Assyrians were a branch of the Semitic family of nations, and therefore members of the same division of the human race as the Syrians, the Phœnicians with their colonies, the Jews, and the modern Arabians. Long prior to the 30th century B.C., Semitism, as a distinct ethnic element, appears to have established itself in Babylonia. There the primitive population, known as Sumerian, belonged to a wholly different type, and were characterised by want of beard, flattish nose, and an agglutinative language. In Assyria, on the other hand, the Semites were preceded by the Mitaunians, a race which had come from the north and was probably related to the Hittites and Proto-Armenians.

In language, Assyrian is allied to the northern branch of the Semitic family. The vocabulary has a close affinity with Hebrew and Phœnician, while in the full development of the verbal conjugation, the use of numeration, and its richness of synonyms, it approaches nearer to the Arabic. Phonetically it has been much affected by Sumerian, and has lost many characteristically Semitic sounds. The predominant features of the Assyrian ethnic type are Semitic, but modified by intermixture with Sumerian and other elements.

Script.—The script used by the Assyrians was the cuneiform or wedge-headed, so called from the resemblance of the lines of which the characters consist to wedges. This was due to their having been impressed by a stylus upon moist clay, the ordinary writing material of Assyro-Babylonian civilisation. The script was the invention of the Sumerians, the primitive population of Babylonia, and was originally a system of pictorial writing, the pictures representing both objects, like 'a man' or 'the sun,' and ideas like that of 'going.' The latter were expressed symbolically, the idea of 'walking,' for instance, being denoted by the picture of a foot. In time some of the pictures came to be used phonetically, the pronunciation of the words denoted by them being detached from the words and employed to represent sounds only. Thus the character which denotes *du*, 'to go,' might be used merely to represent the sound *du*. When Babylonia was occupied by the Semites, they took over the script of the Sumerians, adding fresh characters to it and largely increasing its phonetic use. The Sumerian words became phonetic values; *utu*, 'the sun,' for example, passing into the phonetic value *ut* or *ud*, though the characters still continued to be employed ideographically—that is to say, to denote objects and ideas as well as sounds. One result of this was that the same character could be used both ideographically and phonetically; another is the existence of *polyphony*, every character having more than one phonetic value. In the earlier days of cuneiform decipherment this latter peculiarity proved a great obstacle to progress. When the characters were used as ideographs in Semitic Babylonian or Assyrian, the pronunciation given was naturally that of the Semitic words they represented. Meanwhile the characters had ceased to be pictorial, and had developed into the cursive hand which we call cuneiform, and which bears the same relation to the older pictorial script that the Egyptian demotic does to the hieroglyphics. When the custom of writing upon clay with a stylus was introduced, curved lines necessarily became straight, and the lines themselves assumed a wedge-like form. A change, moreover, took place in the position of the characters themselves. The pictorial characters had been written in vertical columns, like Chinese; when they became cursive, the tablet on which they were inscribed was held sideways in the left hand, so that the characters were turned half-way round and the writing ran from left to right. This happened centuries before 3000 B.C. From Babylonia and Assyria the cuneiform script was carried, along with the other elements of Babylonian civilisation, to all parts of Western Asia. It was used in Asia Minor as early as 2500 B.C., and in Syria and Palestine about the same time. A special form of it was devised at a later date for Armenia, while an alphabet was formed out of it by the Persian kings. Its use in Elam was earlier than its use in Assyria.

It was only very gradually superseded by the simpler Phœnician alphabet, which first makes its appearance in the 10th or 9th century B.C. About the same time Aramaic became the language of trade and diplomacy, so that from the age of Tiglath-

pileser IV. downwards we find even at Nineveh Aramaic dockets in the letters of the 'Phœnician' alphabet attached to cuneiform commercial documents. But in Babylonia the cuneiform system of writing survived almost to the Christian era, and tablets have been found giving transcriptions in Greek letters of Sumerian and Semitic Babylonian words which are written in cuneiform.

Decipherment of the Inscriptions.—The Persian cuneiform texts, which are written in an alphabet, and in which the words are divided from one another, were the first to be deciphered. Darius I. and his immediate successors caused inscriptions to be written in three languages, Persian, Babylonian, and Elamite, and in three forms of cuneiform script. Grottefend, in 1802, identified the names of Darius and Xerxes in the Persian transcripts, and thus obtained the beginnings of an alphabet. Other scholars took up the clue, and by the labours of Rask, Burnouf, Lassen, and Rawlinson the Persian cuneiform alphabet and language were finally made out. The Babylonian and Elamite transcripts were next attacked by Rawlinson, Hincks, Norris, and others, the proper names furnishing a clue to the phonetic values of the characters. Babylonian proved to be a Semitic language, allied to Hebrew, while Elamite was agglutinative. Owing to the difficulties of the Assyro-Babylonian script, however, the decipherment of the Babylonian texts and of the newly found Assyrian inscriptions, which were discovered to be in the same language, was but slow; but the decipherers were aided by the native syllabaries and dictionaries disinterred by Layard in the ruins of Kuyunjik. The discovery of the Sumerian language of early Babylonia next followed, the interpretation of which was given by the native grammars, vocabularies, and translations of Sumerian texts into Semitic Babylonian. The Armenian cuneiform inscriptions were deciphered by Sayce, those of Susa and other parts of Elam principally by Scheil. The recently discovered Hittite cuneiform texts still await an interpreter.

Literature and Civilisation.—One of the most important results of excavation was the discovery, in the palace of Assur-bani-pal at Nineveh, of a large library consisting of many thousands of tablets, large numbers of which are now stored in the British Museum. This library, perhaps, owed its origin to the keen political insight of Esai-laddon, but was completed by his son, Assur-bani-pal, whose name most of the tablets bear. In the colophon or docket attached to each tablet the king says: 'The wise things of Nebo, all there was on tablets I wrote, I engraved, I explained, and, for the inspection of my people, in my palace I placed.' Most of the tablets were copied from more ancient originals in the temple libraries of Chaldea, each being stated to be 'like its old copy,' or 'like the ancient tablets of Sumir and Akkad.' That such was the case is now demonstrated by the discovery of duplicate copies in the libraries of Babylonian cities. The library was evidently founded to prevent the youth of Assyria from going to study at Babylon or Borsippa, where they would be subjected to dangerous political influences. Its educational character is shown by the discovery of the syllabaries, dictionaries, and text-books which exist in it. They constituted the class-books of the students in Nineveh, and have been to a large extent the medium by which the decipherers have learned the older languages of Chaldea. They include works on mathematics, tables of square and cube roots, as well as lists of plants, metals, and precious stones, animals and birds. The geographical works appear to be limited to lists of countries with their products, such as 'Lebanon cedar,' 'Elam horses,' 'Cilicia tin and

silver,' and 'Arabia camels.' The part of the library, however, which has been most prolific in discoveries has been that of the poetic and mythological literature. In 1872 George Smith, of the British Museum, discovered a series of poetic legends relating to the great Chaldean hero, Gilgames, the eleventh tablet of which contains a legend of the Deluge, very closely resembling the Hebrew account. The flood, we are told, was sent as a punishment for sin; the builder of the ark, called Utu-napisti, gathered into the vessel all his male and female servants, and family, and all the beasts of the field. The preparation of the ark occupies seven days; the rain lasts seven days; seven days are occupied in reaching Mount Nizir, on which the ark rested. Here a sacrifice is offered, and the gods, smelling the sweet savour, gather about the altar, and by the intercession of Ea a covenant is made between man and the gods, and sealed by the appearance of the rainbow, which is called the vari-coloured necklace of Istar. The resemblances are very striking; but there are also differences, especially local features, which show that the traditions are not copied from one another, but probably have a common origin in an older tradition. The discovery of this epic was followed by the discovery of an important series of cosmogonic legends. The close resemblance which they present to the Hebrew Genesis story is well illustrated by the beginning of the first legend, which may be thus translated: 'When the heavens above were unnamed and below on earth a name was not recorded, the primeval ocean was the father of them; the chaotic sea was the mother of them all. Their waters were joined in one. The corn-field was not grown (and) no reed was seen. When as yet the gods had not come forth any of them. By name they were not called. Order did not exist,' &c. The resemblance of this to the first chapter of Genesis is remarkable. Many psalms, hymns, and prayers have also been preserved.

Antiquities, &c.—The excavations carried out by Botta, Layard, Rawlinson, George Smith, Rassam, and King at Khorsabad, Kuyunjik, and Nimrud, as well as by the Germans at Kalah Shergat, have led to many very interesting discoveries. The palaces and buildings that have been laid open are full of sculptures, and numerous historical inscriptions have been found in them. Among the most remarkable monuments now in the British Museum are two winged human-headed lions, 12 feet high, and as many in length; winged human-headed bulls of the same dimensions as the lions; winged sphinxes; and the famous obelisk of black marble, from *Nimrud*, sculptured on the four sides. The bas-reliefs are very numerous, exhibiting especially war and hunting. The march, the onset, the pursuit, the siege, the passage of rivers, the submission and treatment of captives, secretaries noting the number of heads taken in battle, and the amount of spoil; the chase of the lion, of the antelope, of the wild ass, and other animals—such are the favourite subjects of the Assyrian sculptor. Nor are they treated in the conventional style of Egypt, but in a manner which, for grace, spirit, correctness, and delicacy of execution, excels everything else known in Asiatic art. The artists sometimes follow modes of representation different from ours; for instance, a bull has five legs given him, in order that from all points of view he may be seen with four; a ladder stands edgewise against a side wall, to show it is not a pole. But a truthful impression is always aimed at, and it is this that gives these sculptures their value. The labour bestowed on the careful finish of a priest's dress, and on the tasteful decoration of an article of furniture, proves them to be the work of an ingenious

and painstaking people. From the bas-reliefs we learn little about the private life of the Assyrians, but there are a few which represent the foddering of cattle, women riding on mules, &c.

It is natural to expect that Nineveh—a wealthy and luxurious city—imported many of the products of other countries, yet the manufactured goods would mainly be of home production. The jars, bronzes, glass bottles, carved ornaments in ivory and mother-of-pearl, engraved gems, bells, ear-rings, arms, and utensils are of excellent workmanship. The ornaments especially are in good taste, and evince no inconsiderable skill in the working of metals. Transparent glass was not unknown, nor the use of the lens as a magnifier. The Assyrians knew the principle of the arch, the use of the lever and roller, and the construction of aqueducts and drains. In the arts of peace they appear to have been not inferior to any ancient nation; while their conquests and the long duration of their empire suffice to prove their capacity for war.

For the archaeology, see the books by Botta, Layard, Oppert, George Smith, and Perrot and Chipiez. For the history, see Rawlinson, *The Five Great Monarchies of the Ancient Eastern World* (4 vols. 1862-67); Oppert, *Histoire des Empires de Chaldée et d'Assyrie* (1865); Lenormant, *Manuel d'Histoire ancienne de l'Orient* (3 vols. 1869); Maspero, *Dawn of Civilization, Struggle of the Nations, and Passing of the Empires*. For the language, see the grammars of Sayce, Delitzsch, King, and Pinches, and the dictionaries of E. Norris (1868-72), Delitzsch (1887), and Muss-Arnolt (1894 et seq.). For the religion, see Tiele's comparative *History of Religion* (1884-88); Sayce's *Hibbert Lectures* (1887), and his *Babylonians and Assyrians* (1900); R. W. Rogers's *Babylon and Assyria* (1901). See further Bezold's catalogue of cuneiform inscriptions in the British Museum (5 vols. 1901), and R. F. Harper's *Assyrian and Babylonian Letters* (1901 et seq.). And see the books cited at BABYLONIA.

As'tacus. See CRAYFISH and LOBSTER.

Astarté, the Greek and Roman form of the name of a goddess worshipped by the Canaanites, Hebrews, and Phœnicians. She may have been a primitive Semitic deity, but more probably is a form of the Babylonian goddess Ishtar, who is mentioned in Babylonian inscriptions much earlier than any mention is to be found of Astarte. Her worship extended wherever Phœnician colonies were founded. The general notion symbolised in her attributes was that of productive power, as that of Baal was generative power. Hence, as the sun is the great symbol of the latter, the moon is of the former; and consequently we find the moon identified with Astarte, and the goddess represented horned like the crescent moon. By others she is supposed to be symbolised by the planet Venus, as was also the Greek Aphrodite. Astarte was the object of a sensual nature-worship, attended by many licentious rites and wild orgies. She was also goddess of maternity and fertility, as well as a war-goddess. Her worship spread to Israel after the conquest of Canaan. She was pre-eminently the city-goddess of Sidon; and her cult was carried by the Phœnicians to the Greeks and the Romans, and by Roman soldiers over the Roman empire, even as far as Corbridge. Prostitution as a religious rite in her service is known to have existed in Babylonia, Syria, Arabia, Carthage, Cyprus, Sicily, and probably amongst the Hebrews and Phœnicians. Amongst many peoples of a lower culture ante-nuptial unchastity, so far from being felt to be immoral, is customary and normal. For the custom a reason and a justification comes, as time goes on, to be required; and the reason found is that the custom, being immemorial, is divine, and is required by a divinity. This deity, like all other deities originally nameless, eventually acquired a name, Ishtar, or Astarte; and the custom became a

religious rite in her service. Then, with the growth of civilisation, the custom itself tends to become more and more offensive, and gradually to be restricted. Thus, though in Lydia, according to Herodotus, the common people maintained the primitive custom, in Babylonia and in Cyprus a single act of compliance served to release the woman from the degrading practice. Some of the legends of Babylonia make Astarte daughter of Sin, the moon-god, the Accadian *Agu* or *Acu*; but others place her among the older gods, making her daughter of Anu, the sky. Considered as the evening star, she was known as *Ishtar* of Erech; as the morning star, she was identified with *Anunit* or *Anat*, the goddess of Accad. With the Accadians she had a separate and independent existence as a divinity, though she came to be considered by the Semites as but the consort and shadow of the god. She presided over love and war, as well as the chase. She was invoked as 'the queen of heaven,' and 'the queen of all the gods.' Her chief temples were at Erech, Nineveh, and Arbela. Carried through the Semitic world, she was identified with the sun-god Chemosh in Moab, became the *Ashtoreth* of the Canaanites, and appears in a somewhat different form as the *Aphrodite* of the Greeks, and the *Artemis polymastos* of Ephesus. One of the most popular of Babylonian myths told how *Ishtar* had wedded the young and beautiful sun-god *Tammuz*, the 'only begotten,' and had descended into Hades in search of him when he had been slain by the boar's tusk of winter. The month of August was called by the Accadians 'the month of the errand of *Ishtar*;' while June was 'the month of *Tammuz*' of the Semites. This 'abomination' could be seen within the very precincts of the temple at Jerusalem (see *Ezekiel viii. 14*).

See in this work the articles *ASSYRIA*, *BABYLONIA*, *PHENICIA*, *EGYPT*, *ADONIS*, *APHERODITE*, *BAAL*, *ISIS*; Langdon's *Tammuz and Ishtar* (1914); and the relevant articles in Hastings's *Encyclopædia of Religion and Ethics* (1908 *et seq.*).

Astarte, a genus of Lamellibranch—i.e. bivalve—Molluscs, the type of a family, *Astartidae*, now represented by a relatively small number of forms in northern seas; but in former ages—e.g. the Lias period—it was widely distributed and represented by numerous species.

Astatic (from the Greek *astatos*, 'unstable') is a term in physics which means 'having no tendency to take a definite or fixed position,' or 'without polarity.' It is used most frequently of a magnetic needle so arranged as to be unaffected by the earth's magnetism. This is managed by taking two magnetic needles, as nearly of the same intensity as possible, and placing them parallel to one another, with their poles in opposite directions. They thus neutralise one another, so as to be unaffected by the earth's magnetism, though they remain sensitive to an electric current, as in the astatic galvanometer.

Astatki, a Russian name for the solid residue after distillation of petroleum, first used in Russia as liquid fuel for locomotives and steamers.

Aster, a genus of the natural order Compositæ, sub-order Tubulifloræ, with many herbaceous and shrubby species, chiefly perennial, of which three-fourths are indigenous to North America, the remainder sparingly distributed over Europe and Northern Asia. One species only, *A. tripolium*, the Sea Starwort, is a native of Britain. It is common in salt marshes. A number of perennial species are in cultivation as garden-flowers, of which the New-England Aster (*A. novæ anglie*) and the Michaelmas Daisy (*A. tradescanti*), both natives of North America, are perhaps the most

common, and, with some of the other species, are prized as among the comparatively few flowers to be seen at that dull season when autumn is giving place to winter. But the best known and most valued of all the asters is the China Aster—*A. (Callistephus) sinensis*—a summer annual, of which many varieties are in cultivation, and new ones are continually introduced. It was brought from China to France by a missionary in the 18th century, but has since been much improved and varied by culture, and all its florets have been rendered ligulate. The varieties exhibit great diversities of form and colour. The plant delights in a rich free soil. In the northern parts of Britain, the seed is generally sown in April in a hot-bed, or in pots under a frame, and the young asters are planted out in the open air in May. They flower from July to the end of autumn, and contribute much to the liveliness of the flower-garden.

Asterabad. See *ASTRABAD*.

Asteria, a variety of Sapphire (q.v.).

Asterias and **Asteriadae**. See *STAR-FISH*.

Asterisk (Gr., 'a little star'), a sign or symbol (*) used in writing and printing, as a reference to a note at the bottom or on the margin of the page. The obelisk, or dagger (†), and many other marks, are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, &c. The asterisk often marks the omission of words or sentences, or it distinguishes words as conjectural or obscure, or it may be used merely as a typographical mark for any specified purpose.

Asteroids. See *PLANETS*.

Asterolepis, a genus of the buckler-headed *Ostracodermi*, formerly considered a primitive type of ganoid fishes, but now constituting, with the *Cyclostomata*, a class by themselves—*Agnathia*. *Asterolepis*, which closely resembled *Pterichthys* (q.v.), occurs in the upper Old Red Sandstone; but the name has been erroneously applied to the remains of a large buckler-headed ganoid fish known as *Homosteus*—of common occurrence in the lower Old Red Sandstone of Scotland and Russia.

Asterophyllites (Gr. *astēr*, 'a star,' and *phyllon*, 'a leaf'), a general name, under which are included some abundant fossil plants of the Coal-measures. The forms so designated are the fluted stems of *Calamites* (q.v.) (*Equisetaceæ*), with slender branches springing from the joints, and bearing whorls of narrow-pointed leaves.

Asthma (Gr.) is a disease characterised by the occurrence of paroxysms, in which the breathing, previously natural, becomes difficult, and is accompanied by wheezing and a distressing sense of tightness in the chest. Asthma frequently appears at first after some inflammatory affection of the respiratory mucous membrane, but often without any such cause. It is sometimes a result of healed tuberculosis of the lung in which the scar tissue acts as an irritating focus. It may begin at any age, but most often before ten. It is often clearly hereditary, affecting several members of the same family; and it may occur in families with a tendency to nervous diseases—e.g. epilepsy. The paroxysms are often preceded by premonitory symptoms—in some by great drowsiness, in others by extreme wakefulness and unusual mental activity and buoyancy of spirits. The difficulty of breathing may become permanent to a slight extent, with severer paroxysms at intervals.

The spasms may occur at any hour, but least often in the forenoon, most commonly between two and four in the morning. The causes inducing an attack vary greatly. In some asthma only occurs with bronchitis, or with disorder of the stomach;

in some it is brought on by particular odours, or articles of food; in many locality exerts most influence—e.g. they may suffer little in a smoky town, much in the country; or the reverse.

The asthmatic paroxysm occurs somewhat as follows: The patient goes to bed and sleeps two or three hours, becomes distressed in his breathing, and begins to wheeze. He awakes, changes his position, falls asleep again and again, and the fight between asthma and sleep may go on, till the increased suffering does not allow the patient longer to forget himself for a moment; he becomes wide awake, sits up in bed, throws himself forward, plants his elbows on his knees, and labours for breath with fixed head and elevated shoulders. If the spasm is protracted, the oxygenation of his blood is imperfectly performed, owing to the scanty supply of air, and his extremities get cold and blue, but at the same time the violent muscular efforts at respiration—in which all the extraordinary muscles of Respiration (q.v.) are called into action—cover him with sweat. The pulse is always small. The chest is fully expanded during the paroxysm, but as it does not relax much there is little interchange of air. Alarming, however, as the attacks are, even to an onlooker, they are almost never fatal.

The symptoms of asthma are probably produced by spasmodic contraction of the muscular fibres surrounding the smaller bronchial tubes (see RESPIRATION); but they may be caused, at least in some cases, by temporary swelling of the bronchial mucous membrane, analogous to Nettle-rash (q.v.) on the skin.

During the occurrence of a paroxysm, the patient's clothes should be loosened, and he should be placed in such a position as will best assist him in his effort to breathe; to this his own sensations will generally guide him. The number of remedies recommended and sometimes useful during the attack is itself a testimony to their uncertainty. A few of the most valuable are antimony or ipecacuanha in emetic doses; very strong coffee; nitroglycerine in small doses; chloroform, transient in its effects, and to be used with caution; inhalations of oxygen; tobacco, stramonium, or lobelia smoked in the usual way, with inhalation of the smoke; blotting-paper impregnated with saltpetre and burnt; and as a preventive of a threatened attack a mixture containing belladonna, nitrite of soda, bromide, and iodide of potassium.

A sufferer from asthma must avoid all causes which he finds apt to induce an attack; must attend carefully to his general health, and especially his digestive system; and may obtain much benefit from tonic and anti-spasmodic medicines. The selection of a suitable locality for residence procures for many sufferers relief or immunity. When asthma begins very early in life, it often passes off at or before maturity.

Asti (*Asta Pompeia*), a city of Piedmont, in the government of Alessandria, lies on the left bank of the Tanaro, 35 miles ESE. of Turin by rail. Population, 50,000. It is a large town, with walls considerably dilapidated, and the streets generally very narrow and irregular. It has a large Gothic cathedral, which was completed about 1348, and a royal college. There is carried on a considerable trade in silk and woollen fabrics, hats, leather, and agricultural produce. The *vino d'Asti*, a kind of Muscatel (q.v.), is highly esteemed. The town is of high antiquity, having been famous for its pottery before its capture by the Gauls in 400 B.C. On the occasion of its being again taken and destroyed in an irruption of the Gauls, it was rebuilt by Pompey, and received the name of *Asta Pompeia*. In the middle ages, Asti was one of the most powerful republics of Upper Italy. It was captured and burnt by the Emperor

Frederick I. in 1155, and, after a series of vicissitudes, came into the possession of the Visconti of Naples; by them it was ceded to the French, in whose hands it remained till the middle of the 16th century, when the Dukes of Savoy acquired it. Alfieri was born here, 1749.

Astigmatism (from Gr. *a-*, 'not'; *stigma*, 'a point'), a defective condition of the eye, in which rays proceeding to the eye from one point are *not* correctly brought to a focus at *one point*. In *regular astigmatism* (a congenital malformation), the curvature of the cornea is unequal in different meridians, those of greatest and least curvature being at right angles to each other. A spot of light is seen as a small oval, instead of a circle, as in a perfect eye; lines in one direction are seen clearly, while lines at right angles to these appear blurred. It can be remedied by the use of suitable glasses, whose surfaces are cylindrical, instead of being spherical like those of ordinary spectacles. *Irregular astigmatism* usually results from old injury or disease of the cornea, and can rarely be improved by glasses. See EYE.

Astley, PHILIP (1742-1814), equestrian, was trained as a cabinetmaker, served in the light horse, and after 1770 constructed nineteen amphitheatres for equestrian performances.

Aston Manor, long a municipal and parliamentary borough of Warwickshire, north-east of Birmingham, was in 1911 incorporated with Birmingham, which in 1864 bought Aston Hall and its park for a museum and pleasure-ground. There are some thirty Astons in England, besides Ashtons.

Astor, JOHN JACOB, millionaire, the founder of the 'American Fur Company,' was born in Germany, near Heidelberg, in 1763. A peasant's son, he helped on his father's farm, until in his 16th year he went to London and worked with his brother, a maker of musical instruments. In 1783 he sailed to America, and by the advice of a dealer in furs whom he met on the voyage, invested his small capital in furs. By economy and industry, he so increased his means that after six years he had acquired a fortune of \$250,000. Although the increasing influence of the English Fur Companies in North America was unfavourable to his plans, he now ventured to fit out two expeditions to the Oregon Territory—one by land, and one by sea—the purpose of which was to open up a regular commercial intercourse with the natives. After many mishaps, his object was achieved in 1811, and the fur-trading station of Astoria (q.v.) was established; but the war of 1812 stopped its prosperity for a time. From this period Astor's commercial connections extended over the entire globe, and his ships were found in every sea. On his death at New York, 29th March 1848, he left property estimated at \$20,000,000, and a legacy of \$350,000 for a public library.—His wealth was mainly inherited by his son, WILLIAM (1792-1875), who at his death left \$50,000,000. He was known as the 'landlord of New York,' and added \$200,000 to his father's library bequest.—A great-grandson, WILLIAM WALDORF, VISCOUNT ASTOR (1848-1919), born in New York and trained for the bar, was minister to Italy (1882), and in 1892 settled in England, where he wrote novels, purchased or founded papers and magazines, and bought estates.—Another great-grandson, JOHN JACOB (1864-1912), built the Astoria Hotel, as his cousin had done the Waldorf (later combined), served as lieutenant-colonel in the Spanish-American war in Cuba, published a romance, invented a bicycle-brake and a pneumatic road-improver, and perished in the *Titanic* disaster.—William Waldorf's son, Waldorf, second Viscount, was M.P. for Plymouth in 1911-19.

Astorga, EMANUELE D' (1681-1736), born at

Palermo, studied music in a Spanish monastery at Astorga in Leon, composed a *Stabat Mater* and an opera, *Dufne*, and died in Bohemia. His life was overlaid with a tissue of doubtful romance.

Astoria, originally a fur-trading station in Oregon, on the Columbia, founded in 1811 by John Jacob Astor, has large salmon-packing and lumber industries; pop. 14,000. The difficulty in navigating the Columbia has been overcome, and there are five miles of water-front within the limits of the city. The British held it in 1813-18, and a British fur company occupied it till 1845. It was chartered as a city in 1876, and selected for a naval base in 1920. See Washington Irving's *Astoria* (1836).

Astrabad, a town in the north of Persia, at the foot of the Elburz Mountains, 30 miles SE. of the Caspian. It was long the residence of the Shah's ancestors, the Kajar princes, but owing to its remoteness the court was removed to Teheran; and since then its importance has declined, whilst the population is said to have dwindled from 75,000 in 1808 to 10,000 or even 5000.

Astræa, daughter of Zeus and Themis, or of Astræus and Eos (Aurora), was the last of all the goddesses to leave the earth when the golden age had passed away. She took her place in heaven as the constellation Virgo in the zodiac.—Astræa is also the name of one of the minor planets (see PLANETS).

Astragalus, or TALUS, a bone of the foot, which, by a convex upper surface and smooth sides, forms, with the leg-bones, the hinge of the ankle-joint. Its lower surface is concave, and rests on the *os calcis*, or heel-bone. See FOOT.

Astragalus. See TRAGACANTH.

Astrakhan, a government in the SE. of European Russia, watered by the Volga, and washed on the SE. by the Caspian Sea. Area, 8140 sq. m., population, 405,500. It is almost entirely a barren waste, the only fertile portions being along the Volga. Salt is procured from the marshes of the steppes, considerable numbers of cattle are reared, and fish are taken in the Volga, and sent to Nijni Novgorod. The climate is marked by its extremes, and the population by the variety of its nationalities.

ASTRAKHAN, its capital, and one of the chief towns of Russia, is situated on a high island in the Volga, 41 miles from its mouth in the Caspian Sea. It is surrounded by fruit-trees and vineyards, and consists of the fortress (Kreml), the White Town (Beloigorod), and 16 suburbs (Sloboden). The Kreml and the White Town alone have houses of stone; the suburbs contain wooden buildings only, and irregular, dirty, and unpaved streets. Lengthwise through the middle of the city runs a canal which connects the Kutum arm of the Volga with the main stream. Of nearly 40 Greek churches, the finest is the cathedral (1696), on the highest point in the Kreml. Population, 122,600, consisting of Russians, Armenians, Tatars, and Persians. Almost the entire commerce with Persia and Transcaucasia passes through the city. Its great markets attract every year many thousands of merchants, and its three bazaars are among the busiest marts in Europe or Asia. The city is connected by steamers with all parts of the Caspian, and is the principal harbour of that sea, although it is only when south winds raise the water that it can accommodate the largest vessels. The principal articles imported are wheat, barley, woollen stuffs, spirits, iron, tin, drugs, fruit, gold manufactures, raw silk, cotton, cotton yarn, and cotton fabrics. The industries are shipbuilding, dyeing, silk manufacture, shagreen-working, tallow-melting, seal-oil boiling, and

soap-making. The fisheries are of high importance, and rank amongst the greatest in the world. Enormous numbers of sturgeon are taken. A university was set up in 1919.—*Astrakhan* is the name of a fine description of fur, the produce of a variety of sheep found in Bokhara, Persia, and Syria.

Astral Spirits. The star (Gr. *astron*) and fire worship of the eastern religions rested on the doctrine that every heavenly body is animated by a pervading spirit, forming, as it were, its soul; and this doctrine passed into the religio-physical theories of the Greeks and Jews, and even into the Christian world. In the demonology or spirit-systems of Christendom in the middle ages, astral spirits are conceived of sometimes as fallen angels, sometimes as souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Their intercourse with men and their influence were variously represented, according to the notion formed of their nature. As the belief in spirits and witchcraft reached its height in the 15th century, the demonologists, or special students of this subject, systematised the strange fancies of that wild period; and astral spirits were made to occupy the first rank among evil or demoniacal spirits. Paracelsus, however, and others attributed to every human being an astral spirit, or sidereal element, in which the human soul, or spirit proper, is thought to inhere, and which lives for a time after the person dies. Moreover, Paracelsus recognised astral or sidereal elements in matter. Astral salt was the basis of the solidity and incombustible parts of bodies; astral sulphur was the source of combustion and vegetation; astral mercury, of volatility and fluidity. These three elements were analogous to the three elements of man—body, soul, and spirit.

Astringents (Lat. *ad*, 'to,' and *stringo*, 'I bind'), medicines employed for the purpose of contracting the animal fibres and canals, so as to check catarrh, hemorrhage, and diarrhoea. The drugs most commonly used as astringents are alum, catechu, oakgalls, rhatany-root, &c. Many of the vegetable astringents owe that property, in whole or in great part, to tannin. A severe degree of cold is a powerful astringent.

Astroca'ryum, a genus of American palms. See PALM.

Astrolabe (from two Greek words signifying 'to take the stars'), the name given by the Greeks to any circular instrument for observing the stars. Circular rings, arranged as in the Armillary Sphere (q.v.), were used for this purpose. A projection of the sphere upon a plane, with a graduated rim and sights for taking altitudes, was known as an astrolabe in the palmy days of astrology. It has been superseded by the more perfect instruments of modern astronomy. Chaucer published a learned *Treatise on the Astrolabe* in 1391, edited by Professor Skeat in 1872 for the Early English Text Society.

Astrolabe Bay, a large inlet of the sea on the northern coast of the eastern portion of New Guinea, opposite the end of New Britain. The vegetation of the shores is luxuriant; a range of mountains, 14,000 feet high, bounds the view some 15 miles inland; the anchorage is exposed and insecure, and there are no practicable harbours.

Astrology (Gr., 'science of the stars') in early times was a comprehensive term for the study, both of the motions of the heavenly bodies, and of their supposed influence on human and terrestrial affairs. Now it has only the latter meaning, the term Astronomy having usurped the former. Astrology is one of the oldest superstitions, prevailing in very early times among the Egyptians,

Hindus, Chinese, Etruscans, and above all, the Chaldeans. Its rise may be regarded as produced by the impatient curiosity, and desire for harmony, of our race. Long ere any regularly operating laws were discerned in national or individual history, they could be seen in the more marked changes of material nature, among which the motions and influences of the heavenly bodies most conspicuously ranked. In the case of the sun, these ruled and vivified the earth. It was natural, then, to suppose that the overruling power which ordered the apparent chances of human life resided in the heavens, and that its decrees might be read there, the motions of the heavenly bodies proving, on trial, to be predictable. The astrology of the Egyptians was founded on solar theories. They connected each point of the sun's course with a stage of human existence. To them its rising, culmination, and gradual descent figured the progress of man's life in youth, maturity, and age. The Chaldeans, or Chaldaic-Babylonians, included in their system the other planets also. It was chiefly to their labours and fancies that the ancient world owed its astrology. Their name even became a synonym for astrologers, and continued long to be so, and on their system medieval astrology was principally founded. But their astrology was more noble in its conceptions than the degraded medieval and modern forms of the science. They considered the stars and planets not as the mechanical powers ruling men's destinies, but as a revelation of the Supreme Being. They held them as incarnations or emanations—sentient beings—proceeding from the absolute Being. Each planet was thus a visible deity. With this mythology, however, was gradually conjoined accurate observation of the motion of the heavenly bodies (see ASTRONOMY), producing a strange mixture of science and fantastic imagery. In Rome astrology found many adherents, though the educated were generally hostile; Cicero, the elder Pliny, and Tacitus declared against it. Seneca, however, believed in the influence of the stars on men; and astrology profoundly influenced the Alexandrian mystics and the Neoplatonists.

The spread of Christianity in the West, and later of Mohammedanism in the East, entirely altered the character of astrology. By both it was robbed of its polytheistic element. But the Arabs, as fatalists, found its tenets more congenial. Under the Khalifs Al Mansur and Albunazar it was diligently cultivated, and is still accepted by the Arabs everywhere. How inwrought in Mohammedan society it became may be seen by any student of the *Arabian Nights*. To Christianity it was less akin; though its influence appears in the beautiful story of the wise men of the East journeying to our Saviour's cradle. These were most probably Chaldean magi and astrologers. Some of the early fathers, however, accepted or modified the doctrine of astrology. Clemens Alexandrinus, Origen, and Augustine, all protest against it. By later church authority it was regarded as obnoxious, and several times publicly condemned. But by many zealous Catholics, and even churchmen, it was cultivated. Cardinal D'Ailly, in the 15th century, is said to have calculated the horoscope of Jesus Christ, and maintained the astrological predictability of the deluge. Louis XI. of France, among his many superstitions, numbered also this, and maintained for long the astrologer Galeotti. Nostradamus (q.v.) was the great astrologer of the 16th century; during which, though the most learned and powerful minds continued to cultivate the science, it gradually declined from its former position of credit and power. It could not endure the double assault of the Reformation and its accompanying

spirit of true scientific inquiry. Tycho Brahé, Kepler, and Gassendi represent well this stage in its history. Their own discoveries, with those of Copernicus and Galileo, sapped its foundations, though they could not shake off its influence on themselves. Protestant theologians like Melancthon cultivated the science. Paracelsus and Cardan combined astrology with alchemy and medicine. Burton, of the *Anatomy*, died about the date he had himself forecast. Robert Fludd and William Lilly in England represent the latest period of the public power of astrology. The latter especially is well known by his almanac, his prophecy of the great plague and fire of London, and his claim to foresee the fate of Charles I. He was even for a time pensioned by parliament for giving information. Dryden had his children's nativity reckoned. With Newton, astronomy emerged from mystery. His conceptions extended the terrestrial laws of the planets. The sun and stars—in his words, 'but great earths vehemently hot'—could no longer be viewed as rulers of destiny, and astrology thenceforth passed into the hands of quacks and pseudo-scientists, only an isolated effort being made here and there to rehabilitate it.

For great solitary minds, astrology has ever had an attraction. Wallenstein was a complete believer in it, and Napoleon I. often spoke of his star and his destiny, and through them was accessible to flattery. A modern astrologer declares that Napoleon and Wellington were born, the one under Saturn, the other under Jupiter, in the house of dignities. Hence Napoleon's dignities were misfortune to himself and others, Wellington's were beneficent, and finally superior. This astrologer was not a Frenchman. One of the last professed astrological authors of standing was Pfaff in Germany, who published his *Astrologie* in 1816. Amongst Parsees the wedding-day is fixed by an astrologer.

Natural astrology, the science by which the motions of the heavenly bodies were predicted so far as the knowledge of the time might allow, contained much of scientific value, and is now absorbed in Astronomy (q.v.).

The science of *judicial astrology*, which studies to predict terrestrial occurrences by means of the heavenly bodies, is simple. For its purposes the celestial sphere was divided into twelve sectors called 'houses of heaven.' The surface of a peeled orange appears divided in a manner which fairly represents these. Place the axis of the fruit horizontally in a north and south line, then the divisions of its surface will represent their position on the most common system. If its axis be inclined so as to point either to the pole of the equator or ecliptic, it will show the houses on other less common plans. These houses are supposed fixed, and the planets in their diurnal and orbital movements thus pass from one to another, traversing them all in a day. We shall use only the common system in explaining. On this, as the astrologer stood looking southward, he would have six houses dividing the visible heavens, in order from left to right, the horizon dividing these from the six below him. In three ways these houses differed. Their power depended on their *position*, the one containing the stars about to rise being most powerful. It was called the 'ascendant' (hence our expressions 'ascendancy' and 'his star is in the ascendant'). Secondly, the houses differed in their subject matter, thus: (1) Life, (2) riches, (3) brethren, (4) parents, (5) children, (6) health, (7) marriage, (8) death, (9) religion, (10) dignities, (11) friends, (12) enemies. Thirdly, certain houses belonged to certain planets, which, when in them, had peculiar power. How the characteristics of a

house were summed up may be seen from the following description, taken, however, from a work founded on the *ecliptic* scheme. 'Cancer (in this scheme the fourth house) is the sign of the tropic, particularly fruitful, but cold, watery, nocturnal, northerly, movable, weak, and mute. It is the house of the moon, and exaltation of Jupiter. It produces fair and pale complexions, round features, gray or mild blue eyes, weak voice, the superior portions of the body large, slender arms, and an effeminate constitution.' Three houses were assigned by the observer to each of the four ages of the person whose horoscope was drawn, and we can easily see how, having fixed the planetary configurations, he had the means of a pseudo-scientific prophecy at his disposal.

Usual Method, in drawing a Horoscope, of representing the Twelve Houses of Heaven.

From the above description it can also be seen how closely astrology was connected with physiognomy and observation of bodily appearance. Each planet—in some schemes each house—ruled certain parts of the world and of the human body, being thus productive or avertive of certain diseases, and specially ruling certain states. Mars was lord of iron and the blood. Aries ruled Great Britain, France, and Germany. A conjunction of Mars and Saturn (malignant in his influence) in Aries might then threaten war and pestilence to a great part of Europe. Gemini ruled the arms and shoulders. But different authorities, in a matter so much of fancy, differed much in assigning those properties, and fierce controversies have raged between them, now happily forgotten. Still, however, many accept this strange, but not unnatural, superstition. The astronomer royal is often annoyed by letters requesting him to draw the horoscope of children, or to help by the stars in finding lost property. Hence astrology is now a means of extracting money from the simple. The 'astrology man,' or sometimes 'woman,' still has a delineation of the zodiac in his darkened room, and conjures with it to the loss of curious servant girls and apprentices. *Zadkiel's Almanac* and the magazine *Urania*, by their existence show, too, that such credulity is not confined to the illiterate. But the chief interest of astrology to the educated is as an almost forgotten, but remarkable, development of the mind of man. Our everyday language, however, still testifies to the once widespread belief in astrology. We still speak of men as 'jovial,' or 'saturnine,' or 'mercurial' in temperament—an unconscious survival of a time when the planet under which a man was born per-

manently influenced his life. Jupiter or Jove was the joyfulest star, hence those born when he was in the ascendant were *jovial* and joyous; while those born under Saturn were *saturnine*, grave, and gloomy; and those under Mercury as *mercurial* and light-hearted as himself. The words 'disastrous,' 'ill-starred,' 'ascendency,' and 'influence,' as well as such phrases as 'born under a lucky star,' point in the same direction. Long after astrology ceased to be a belief, it retained its power over the imagination. Thus allusions to it are frequent in Milton, Ben Jonson, and their contemporaries, though its claim to being a real science was by that time generally discredited. It is interesting to see that even Chaucer in his later tales had come to think it a delusion, though in earlier years he must have been a devoted student of it, as is testified by his learned discussion of the subject in his *Treatise on the Astrolabe*, written for his son and published in 1391.

See Henry Christmas's *Cradle of the Twin-Giants* (1849); Sayce's *Astronomy and Astrology of the Babylonians* (1873); R. C. Thompson's *Reports of the Magicians and Astrologers of Nineveh and Babylon* (1901 et seq.); the bibliography in *Notes and Queries* for 1891; A. T. Story's *Holmes and Varley* (1894); and treatises on astrology by 'Raphael' (R. C. Smith; 1828, new ed. 1884), 'Zadkiel' (R. J. Morrison; 1832, new ed. 1862-63), A. J. Pearce (1889), and Wilde and Dodson (1894).

Astronomy is the most ancient of the sciences. The Chinese, Hindus, Chaldeans, and Egyptians observed and studied the heavens long before the Christian era. It is uncertain to which of these nations priority should be given, but Western astronomy traces its ancestry through the Greeks to the Egyptians and Chaldeans. The Chinese have astronomical annals, claiming to go back to 2357 B.C., which record comets and solar eclipses. In the reign of the Emperor Yao, 2300 B.C., there were professional astronomers, who were compelled, on pain of death, to predict solar eclipses, so that the necessary steps might be taken to propitiate the dragon which was supposed to devour the sun. At an early period the Chinese fixed the length of the year at 365½ days, and were acquainted with the remarkable cycle—afterwards discovered by Meton about 400 B.C.—that nineteen years are equal to 235 months. In the 11th century B.C. they are said to have made observations of the height of the sun at the solstices in midwinter and midsummer, and thus fixed the inclination of the ecliptic.

The Chaldean priests observed the times of rising and setting of the heavenly bodies from a very early period, and recorded the dates and circumstances of eclipses. Callisthenes, who accompanied Alexander the Great to Babylon, is stated by Simplicius and Porphyry to have discovered on tablets of baked clay records of eclipses dating back to 2234 B.C. A Babylonian tablet in the British Museum records an eclipse of the sun which occurred in 1062 B.C. From their catalogues they discovered the cycle called the Saros, of about eighteen years and ten days, after which eclipses very approximately recur. The Chaldeans knew that the year consisted of 365½ days, discovered the sun-dial, and divided the day into twenty-four hours. They observed the movements of the planets among the stars, and between 2000 and 3000 B.C. had noted the annual motion of the sun among the constellations of the zodiac. The discovery that the sun moves among the stars, completing its circuit in a year, is a great landmark in the history of astronomy.

The Egyptians fixed the length of the year at 365½ days. This was of special importance to them in connection with the rising of the Nile, and they are probably the first nation to substitute the year for the month as the standard measure of time. The accurate orientation and other features in the

construction of the Great Pyramid show that they possessed considerable astronomical knowledge. But they appear to have studied geometry and geodesy more than astronomy, and not to have made such great progress as the Chaldeans.

Thales (640 B.C.), the founder of the Ionian school of philosophy, is credited by later writers with having introduced Egyptian astronomy into Greece. He is said to have predicted the eclipse in Ionia which occurred in 584 B.C. whilst a battle was being fought between the Medes and Lydians, and was acquainted with the Babylonian Saros. He taught that the stars were made of fire, and had vague ideas as to the spherical form of the earth.

Pythagoras (6th century B.C.) and his followers made considerable progress. He taught that the earth, like the heavenly bodies, was spherical, and rested in the middle of the universe without requiring any support. The stars, he supposed, were attached to a crystal sphere which revolved daily on an axis through the earth, while each of the seven planets (i.e. the sun, moon, Mercury, Venus, Mars, Jupiter, and Saturn) moved on a sphere of its own. These, as they revolved, made the music of the spheres. Pythagoras is said to have discovered the identity of the morning and evening star (the planet Venus). He appears to have explained correctly the phases of the moon as arising from its being a spherical body illuminated by the sun, seen at different angles.

A number of astronomical references are found in Plato's *Dialogues*. Plato did not encourage observations of the movements of the heavenly bodies, but is said to have suggested to his pupils the task of explaining the celestial motions as made up of uniform circular movements. Eudoxus (409-356 B.C.) attempted this, and may be regarded as a predecessor of Hipparchus in trying to formulate a geometrical representation of the movements of the planets. From Aristotle (384-322 B.C.) we obtain a complete view of Greek astronomy of the time. He gives several proofs that the earth is spherical: the circular edge of its shadow cast by the sun on the moon in lunar eclipses; some stars are seen to rise above the horizon and others to disappear when one travels north or south. He argues against the earth's rotation on the ground that no changes are perceived in the positions of the stars. He concluded that the moon was nearest to the earth of all the celestial bodies, then the sun, then the planets, and finally the fixed stars. Alexandria next became the centre of astronomical learning and discovery. Aristarchus gave a method of finding the relative distances of the sun and moon, and concluded that the sun was twenty times more distant. Timocharis and Aristyllus made observations of the relative positions of the fixed stars, thus making the first catalogue of the stars. Eratosthenes (276-196 B.C.) determined the size of the earth by measuring the distance from Alexandria to Syene in southern Egypt, combined with the observation that at the summer solstice the sun was in the zenith at Syene, but $\frac{1}{8}$ th part of the circumference of a circle (about 7°) to the south of the zenith at Alexandria. He determined the obliquity of the ecliptic to be 23° 51', the error of which is only 7'.

The greatest of Greek astronomers, Hipparchus of Bithynia (190 to 120 B.C.), was a mathematician and invented trigonometry, and was thus able to make numerical calculations of the movements of the heavenly bodies. He was also a great observer, and made a catalogue of the positions of no less than 1081 stars, being stimulated to this by the appearance of a new star in the constellation of the Scorpion. Comparison of this catalogue with the earlier ones of Timocharis and Aristyllus led him to the discovery of the precession of the equinoxes. He determined the distance of the moon with

great precision as fifty-nine times the radius of the earth. He determined the inclination of the moon's orbit to that of the ecliptic. He also determined the eccentricity of the moon's orbit, and discovered the revolution of the apse—or nearest point of the orbit to the earth—in a period of nine years. The sun moves more rapidly among the stars in the winter than in the summer. Hipparchus showed that its movement could be represented by supposing the earth to be a little way from the centre of the circle which the sun describes uniformly. He placed the earth at $\frac{1}{3}$ th of its distance from the sun away from the centre, making the sun farthest from the earth near the beginning of June. By the use of the eccentric and the epicycle he was able to give a representation of the celestial movements, which was as accurate as the observations of the time allowed. In other words, he obtained a mathematical formula which agreed with the movements of sun, moon, and planets, and could be used for predicting their positions with all the necessary accuracy. In his system the earth was placed at the centre. It is said that he was nearly persuaded to adopt the heliocentric views of his contemporary Seleucus. Had he done so, the heliocentric system would have doubtless been the received doctrine of astronomy 1500 years before Copernicus. Astronomy was left by Hipparchus as an exact science. No substantial additions were made for two and a half centuries. Ptolemy (130-150 A.D.) found an inequality in the motion of the moon known as the evection. He also discovered that the earth's atmosphere refracts the light from the stars, and pointed out the effects of this refraction. His great astronomical treatise, the *Great Collection* (generally known by its Arabic title the *Almagest*), is a complete exposition of the views and theories of Hipparchus, with improvements and extensions in detail made by Ptolemy himself. From this book our knowledge of Greek astronomy is mainly derived; by it the great science of astronomy which had been built up by the Greek geometers was preserved to the world; further, it occupied the unique position of being the received scientific authority for no less than 1400 years.

The history of astronomy may be rapidly summarised from the publication of the *Almagest* to the death of Copernicus (1543). In the year 762 A.D. the Khalif Al Mansur established an observatory at Bagdad, and his successor, Haroun Al Raschid, the hero of the *Arabian Nights*, had the *Almagest* translated into Arabic. Astronomical instruments were improved, and observations made regularly. Albategnius, who made accurate observations from 878 to 918 A.D., determined the inclination of the ecliptic and the rate of precession of the equinoxes with greater accuracy, and found that the position of the sun's apogee (i.e. its greatest distance from the earth) had changed since the time of Ptolemy. He introduced the use of sines and versines instead of chords. In the 11th century the Persian poet Omar Khayyam had charge of an observatory, and carried out the reform of the calendar referred to in the *Rubaiyat*.

In the 13th century Nasir-Edin, under the patronage of the grandson of Genghis Khan, established a magnificent observatory at Meraga in northern Persia. His instruments were larger and more accurately made than any previously in use. He determined the precession of the equinoxes as 51" annually (only 1" in error), and constructed tables for computing the movements of the planets.

Ulugh Beg (1394-1449), a grandson of Timur, made an observatory at Samarkand, and reobserved with great accuracy the positions of the fixed stars given in Ptolemy's catalogue. The Arabs and their successors made no important original discoveries in astronomy. They corrected and improved in detail the theories of the Greeks. But

they advanced astronomy by their improvement of instruments and the habit of making regular and systematic observations. The introduction of the Arabic system of numeration greatly facilitated astronomical computations by the simplification of arithmetical work.

In the 13th century astronomy was introduced into western Europe, the first translation from the *Almagest* being made under the Emperor Frederick II. about 1230; and in 1252 an impulse was given to the science by the formation of astronomical tables under the auspices of Alphonso X. of Castile. A Yorkshireman, John Holywood (Sacrobosco), about this time wrote the *Sphæra Mundi*, largely a translation from Ptolemy, a book which had a great influence for several centuries. Purbach at Vienna, 1460, and his more famous pupil, Regiomontanus of Königsberg (1433-76), who afterwards published at Nuremberg *Ephemerides* and data for finding latitude and longitude at sea, and his pupil Waltherus, by their observations and published books fostered the growing zeal for the study of astronomy.

A new epoch in astronomy opens with Copernicus (1473-1543). He pointed out that the common diurnal movement of the stars is explained by the rotation of the earth; that the annual movement of the sun is as well accounted for by a revolution of the earth round the sun as of the sun round the earth; and that the assumption that the earth and planets are revolving round the sun in concentric circles with suitable velocities explains why the inner planets Mercury and Venus oscillate from one side of the sun to the other; and why periods of retrograde movement among the stars occur periodically in the motion of the planets Mars, Jupiter, and Saturn. This simplification in the celestial movements was only brought about by an hypothesis which demanded much from the imagination—namely, that the earth, which to our senses appears fixed, is turning and moving with a great velocity. Copernicus, through fear of the opposition such views would encounter, hesitated for a time to publish them, and his book *De Revolutionibus* was only printed in the year of his death. As this treatise required considerable knowledge of mathematics, it appealed only to the learned, and no great commotion was made by the heretical nature of its contents. Reinhold, professor of mathematics and astronomy at Wittenberg, calculated the *Precession Tables* on the basis of the *De Revolutionibus*. Rheticus, also a professor of mathematics and astronomy at Wittenberg, was another enthusiastic advocate of the Copernican system. Through their advocacy it came into use, at any rate as a geometrical hypothesis, by means of which planetary movements were calculable.

A great advance in astronomy in a wholly different direction was made by Tycho Brahe (1546-1601). He was a great astronomical observer. For years he observed the sun and planets whenever possible, and not occasionally, as most of the older astronomers had done. Astronomical instruments were constructed by him of great size and accuracy. To determine the altitudes of celestial bodies he made a quadrant of radius 19 feet, whose rim was divided to each minute (1'). The accuracy he attained in his numerous observations was such that Kepler speaks of an error of eight minutes as incredible. He did not accept the Copernican system, but made all the planets except the earth revolve round the sun. He made important discoveries in connection with the motion of the moon—the variation, annual equation, and inequalities in the movement of the nodes. He calculated the first table of refractions. In 1577 he made observations of the comet which appeared in that year, and proved that it was at least three

times the distance of the moon, thus refuting the current doctrine that comets were exhalations in the atmosphere. He made careful observations of the new star which appeared in 1572, and showed that the distance of this body was so great that it must be in the region of the fixed stars.

Kepler (1571-1630), the pupil of Tycho, was entrusted with the study of the planet Mars, of which a very valuable series of observations had been made. He pursued his task with almost incredible perseverance, trying hypothesis after hypothesis. Ultimately he discovered that the observations were satisfactorily represented by the assumption that the earth and Mars described ellipses about the sun as focus. He enunciated the famous laws of planetary motion associated with his name (see KEPLER)—laws which, apart from the very minute action of one planet on another, accurately describe the orbits and velocities of the planets around the sun.

The final establishment of the Copernican system was accomplished by Galileo (1564-1642). Having heard of an instrument invented in Holland which made distant objects appear near, but without any knowledge of the method of its construction, he made a telescope for himself, and with it scrutinised the heavens. He was rewarded by a succession of remarkable discoveries. Many more stars were seen than were visible to the naked eye. The moon's surface showed inequalities, which appeared like mountains and seas. The planet Venus showed phases like the moon. The planet Jupiter was seen to be accompanied by four bright companions which circulated round it. The sun was seen to have spots whose movements indicated its rotation on an axis. The bearing of these observations on the Copernican hypothesis was pointed out by Galileo. If the sun rotates, why not the earth? If Jupiter travels round the sun accompanied by its satellites, why cannot the moon accompany the earth? The sensible discs of the planets suggested that they were bodies like the earth. The geometrical arguments of Copernicus were thus reinforced by more popular ones based on these new observations, and the view was established that the earth and the planets were similar bodies revolving round the sun as centre. Galileo published his opinions in an attractive form in a *Dialogue on the Two Chief Systems of the World, the Ptolemaic and Copernican*. This book met with approval in the universities of Europe, but brought on Galileo the condemnation of the Inquisition (see GALILEO).

The next great epoch in the history of astronomy is the publication of Newton's *Principia* in 1687. In the half-century which intervened between this and the discoveries of Kepler and Galileo important progress was made in many directions. Scheiner, a rival of Galileo's, who disputed with him priority in the discovery of sun-spots, found faculae, or brighter areas, on the solar surface. Hevelius (1611-87) in his *Selenographia* carefully mapped and described the surface of the moon; in his *Cometographia* he collected all the observations that could be found of comets; and published an accurate catalogue and atlas of 1500 fixed stars. Huyghens (1629-95) discovered that the appearances round Saturn which had puzzled Galileo were caused by a thin, flat ring surrounding the planet in the plane of its equator, and seen at different times from different points of view owing to the earth's motion. He also discovered the satellite Titan. Huyghens greatly improved telescopes; but his important service to astronomy is his adaptation of the pendulum to clocks, by which a time-keeper sufficiently reliable for astronomical purposes was first obtained. This added to the astronomer's equipment an instrument of as great value as the divided quadrant for measuring the positions of

the stars. Gascoigne, who was killed at Marston Moor in 1644, by placing wires in the focal plane of the object-glass furnished the telescope with a definite line of sight, and thus made it an instrument of precision in determining the directions of the stars. Snell in Holland and Picard in Paris made accurate geodetic measurements, which gave very correct values of the size of the earth. Picard was associated with Cassini (1625-1712), who was appointed by Louis XIV. director of the Paris Observatory, completed in 1671. Cassini discovered the rotation of Jupiter and Mars about their axes, four satellites of Saturn, and the division in its ring called after him. Under the direction of these astronomers an expedition was sent to Cayenne, near the Equator, in 1671-73. From a simultaneous series of observations of Mars made at Cayenne and at Paris the difference in position of Mars among the stars, as seen from the two stations, was determined. In this way the parallax of Mars, an angle which measures the ratio of the earth's radius to the distance of the planet, and thus the distance itself, was determined. As the relative distances of the planets from the sun are given by Kepler's laws, a great problem in astronomy—the determination of the sun's distance and the scale of the solar system—was solved. The distance of the sun was found to be 87 millions of miles, in good agreement with the modern value of 92,880,000 miles. Another important discovery made in this expedition was the fact that a pendulum of given length beat more slowly at Cayenne than at Paris. This observation was subsequently interpreted by Newton as showing the spheroidal form of the earth. Among other discoveries which contributed to the advance of astronomy may be mentioned the algebraic method of studying geometry devised by Descartes, and the invention of logarithms by Napier.

Newton (1643-1727), in the *Laws of Motion*, stated the relationship between forces and the changes of motion produced by them. Applying the principles he had enunciated to the laws of planetary motion discovered by Kepler, he found that each planet was attracted to the sun by a force which varied inversely as the square of the distance. He was led to the law of universal gravitation, that 'every particle of matter attracts every other with a force proportional to the product of the masses and inversely as the square of the distance between them.' He then, with the greatest mathematical genius, deduced from this single principle an explanation of the movement of the planets about the sun, of comets, the most important features in the movement of the moon disturbed in its elliptic motion around the earth by the sun, the spheroidal figure of the earth, the action of the sun and moon in causing the tides, and the movement of the earth's axis which gives rise to the precession of the equinoxes. See NEWTON.

Newton bequeathed to the mathematicians and astronomers who succeeded him the task of verifying that the minutest details in the movements of the heavenly bodies were deducible from the law of gravitation. He had used geometrical methods, but a great development of analysis and of theoretical dynamics was required before the intricacies of planetary and lunar motions could be traced to their gravitational source. This was in the main accomplished by about the end of the 18th century by a great school of mathematicians, mainly French, of whom Euler, Clairaut, D'Alembert, Lagrange, and Laplace are the greatest names. D'Alembert, Euler, and Lagrange developed theoretical dynamics; Clairaut the theory of the earth's figure and the variation of the force of gravity on its surface; Euler and Clairaut the theory of the moon's movements; Lagrange and Laplace the interaction of the planets. Laplace, in particular, made important contribu-

tions to all branches of gravitational astronomy; and in his great work, the *Mécanique Céleste*, published in 1802, all the more important movements of the bodies in the solar system are deduced as consequences of Newton's law. See LAPLACE.

The ever-increasing accuracy and extent of observational astronomy has made increasing demands on gravitational theory. There are still a few outstanding discrepancies; though they are extremely small, it is not impossible that they are evidence of forces in the solar system other than that of gravitation. The movement of the node of Venus and of the apse of Mercury are not in exact accord with theory (but see RELATIVITY). Of all the problems of gravitational astronomy, a complete theory of the movements of the moon has been the most difficult. Hansen, Delaunay, G. W. Hill, and E. W. Brown, developing more completely the theory of Hill, completely investigated not only the influence of the sun, but also of the planets and of the spheroidal figure of the earth in the movement of our satellite. There still remain two or three small but well-marked discordances between theory and observation.

The completeness with which the theory of gravitation accords with the observed motions of the planets may be well seen by the circumstances attending the discovery of the planet Neptune. The motions of Uranus, the planet discovered by Herschel in 1781, were closely watched and the orbit it should follow calculated. For fourteen years its positions agreed sufficiently well with those predicted for it, and then for twenty-seven years were more and more in advance of the predicted places, after which it fell back again. The greatest amount of this divergence was 2', or only one-fifteenth of the apparent diameter of the moon, a quantity barely perceptible to the naked eye. Suggestions were made that the attraction of an undiscovered planet exterior to Uranus was the cause of this irregularity. Two astronomers, Leverrier at Paris and Adams at Cambridge, attempted to find by mathematical calculation the position of the disturbing planet. Search was made for the planet at Cambridge and Berlin, and it was found by Dr Galle at Berlin on September 23, 1846, within 1° of the position assigned by Leverrier and 3° of that assigned by Adams.

A great impulse was given to observational astronomy, as well as to gravitational theory, by the attempt to supply sailors with satisfactory data for determining their positions at sea. It was represented to Charles II. that the existing catalogues of stars were unreliable, and on his initiative the Royal Observatory was founded at Greenwich in 1676. John Flamsteed, who had drawn attention to the need for observations of the positions of the stars, was appointed Astronomer Royal. He was an assiduous and accurate observer; and the *Historia Cœlestis*, published by him in 1725, contains the positions of 2884 stars. He determined the right ascensions of stars from the times of their meridian transits, making use of a clock—the method in use at the present day. He was succeeded by Halley, the friend of Newton, who discovered, from comparison with Ptolemy's catalogue, that some of the brighter stars possessed *proper motions*, and by examination of early records of eclipses that the mean motion of the moon per century was slowly increasing. He is still more famed for his recognition that the comet which appeared in 1682 had visited the earth on two previous occasions, and his confident prediction that it would return about the year 1759. His successor was James Bradley, who discovered the aberration of light and the nutation of the earth's axis. He also made a catalogue of 3200 stars, based on 60,000 observations. This catalogue of stars, which was re-reduced by Bessel

and again by Auwers, is the starting-point of modern stellar astronomy. These observations are the earliest which are of sufficient accuracy to be compared with modern observations for the determination of the proper motions of the stars. Contemporary with Bradley was the French astronomer Lacaille. In an expedition to the Cape (1750-54) he made observations of 10,000 southern stars. By comparison of observations at the Cape and in Europe he redetermined the parallaxes of the sun and moon. He also made pendulum observations at Mauritius and the Cape, and measured at the Cape an arc of the meridian of more than 1° of length. He also made excellent solar tables based on a large number of observations, and included in the calculations the perturbing effects of the planets on the earth's ellipse round the sun.

Germany was represented during this period by Tobias Mayer of Gottingen. He had a good instrument, which he carefully studied; and his observations of stars made about 1755 are only second to Bradley's, and have been found worthy of re-reduction in recent times. Combining the mathematical method of Euler with a careful determination from observation of the numerical values of certain constants, he worked out a lunar theory from which he calculated tables for predicting the moon's position. Mayer died soon after these tables were published in 1753. On Bradley's favourable report of the accuracy of the tables the sum of £3000 was awarded to Mayer's widow by the British government, as part of a prize of £20,000 offered for lunar tables of sufficient accuracy to be used in determining longitude at sea.

The application of astronomy to the purposes of navigation was furthered by Maskelyne, who was Astronomer Royal from 1766 to 1811. He instituted the *Nautical Almanac*, in which the positions of the sun, moon, and planets are calculated for several years ahead. The necessity for this arises from the fact that the calculations of positions of the heavenly bodies, and especially the moon, are too complex and long to be made by a navigator. Maskelyne is also famous for his determination of the mean density of the earth from the observation of the attraction of the mountain Schiehallion on the plumb-line.

During the 18th century notable improvements were made in astronomical instruments. Bradley's quadrants by Bird were so well constructed and divided that the altitudes of stars were observable within a few seconds of arc; Dollond's discovery of the achromatic object-glass vastly improved the telescope; Graham and Harrison made clocks instruments of great precision; and Harrison invented the chronometer.

We come now to Sir William Herschel, who was the pioneer in the study of the fixed stars and the construction of the sidereal universe. With the large reflecting telescopes, constructed by himself, he discovered the planet Uranus, satellites of Saturn and of Uranus, the existence of double stars circulating about one another, and of nebulae. His indefatigable observations were accompanied by daring speculations, and we owe to him the discovery of the movement of the sun through space and the first determination of the form of the sidereal universe. As Galileo revealed the system of the planets, so Herschel revealed the system of the stars. His observations extended from 1772 till 1820, two years before his death at the age of eighty-two. They were continued and extended to the southern heavens by his son, Sir John Herschel.

A great step in our knowledge of the stars was taken in 1838, when, almost simultaneously, Bessel determined the distance of 61 Cygni, Henderson that of α Centauri, and Struve that of γ Lyrae. These stars were found to be at distances of 600,000

times, 720,000 times, and 800,000 times the distance of the sun from the earth. The determination of stellar distances had long engaged the attention of astronomers, especially after the acceptance of the Copernican system. This important and arduous work has been carried on at Leipzig by Peter, at the Cape by Gill, and at Yale by Elkin and Chase. These observers have employed the heliometer, the form of instrument used by Bessel and first constructed by Fraunhofer. Photography has simplified the determination of parallaxes, and great progress in this direction is being made at the present time.

The early part of the 19th century witnessed the development of the transit-circle, by which, in combination with a clock, accurate positions of the heavenly bodies are determined when they cross the meridian. Instrumental improvements and simplifications in the details and methods of reduction were made by Struve, Argelander, Bessel, and Airy. Catalogues giving the positions of many stars with great accuracy were constructed by these astronomers. Other catalogues, of greater numbers but inferior accuracy, were made by Piazzi, Lalande, and Groombridge at the beginning of the century. Later in the century a great extension in this class of work took place in national observatories. Under the auspices of the *Astronomische Gesellschaft* a number of observatories in Europe and America have combined to form a catalogue of all stars down to the ninth magnitude from the North Pole to 30° S. declination. This work owes its importance to the information derived from it of the proper motions of stars on the face of the sky, and the statistical inferences deducible as to the distances and movements of the stars. The systematisation of the numerous catalogues of stars and the elimination of errors inherent in them has been undertaken by Auwers, Boss, and Newcomb, and has contributed largely to their accuracy and value. During the 19th century telescopes were improved both in size and the perfectness of their definition. The largest object-glass made by Dollond had a diameter of only $3\frac{1}{2}$ inches. Early in the century a Swiss artist, Guinand, discovered how to cast larger discs of glass of the necessary uniformity. He was employed by Fraunhofer, who constructed object-glasses of great perfection of 6 to 9 inches aperture. In 1840 a 15-inch object-glass was made by Merz for the Imperial Observatory at Pulkova; in 1870 a refractor of 25 inches (the Newall telescope now at Cambridge) was made by Messrs Cooke. The largest refractors of the present day are the 36-inch of the Lick and the 40-inch of the Yerkes Observatories, both made by Alvan Clark & Sons. The reflecting telescope, invented by Newton, and developed so greatly by Herschel, entered on another stage owing to Liebig's discovery of a process of depositing a metallic film of silver on glass. Large reflectors were made by Common in England from 1833 to 1898. Still larger and more perfect ones have since been made by Ritchey in America, of which the largest yet completed is a 60-inch mirror of the Mount Wilson Observatory in California.

The experimental determination by Kirchhoff in 1859 of the meanings of the dark lines in the solar spectrum opened up new fields of research into the physical and chemical constitution of the heavenly bodies. In solar research, Lockyer, Janssen, Young, Hale, and Deslandres are the most prominent names. The application of spectroscopy to the stars was commenced by Huggins and Secchi. The former discovered the existence of terrestrial elements in the stars, the gaseous nature of some of the nebulae, and the chemical and physical constitution of comets. The latter made a classifi-

cation of thousands of stars according to the character of their spectra. Huggins initiated the determination of velocities of stars to or from the earth from the small shift in the positions of their spectral lines. This was brought to success by Vogel after the introduction of photography. It has received great development from the increased size of telescopes, and in recent times the velocities of hundreds of the brightest stars have been determined with great accuracy by European, and especially by American, astronomers.

The introduction of photography, and especially of the dry plate, has been of great service in many directions; most of all in spectroscopic researches. At several observatories daily photographs of the sun are taken for the study of sun-spots. At others, with the spectroheliograph, the sun is photographed in monochromatic light for the study of prominences and of flocculi. In eclipses all important observations are photographic. Photographs taken with large reflecting telescopes have revealed the forms and extent of the nebulae, and the forms and changes in the tails of comets. Many minor planets have been discovered, and several small satellites of Jupiter and of Saturn, by means of photography, which has done good service where exact measurements over a limited field are required, as in measures of stellar parallax, of the solar parallax through that of a minor planet, of the positions of satellites, minor planets, and comets. An International Photographic Chart of the Heavens was inaugurated at Paris in 1884. This chart gives the positions of millions of stars, since the positions of the brighter stars seen on the photographs are known, and serve as a framework of reference for the rest.

The continuation of visual observations is necessary for the determination of the accurate relative positions of the brighter stars. They are also generally employed in some other researches, such as the determination of the variation of latitude. The quivering and want of steadiness created by the earth's atmosphere makes visual observations essential in the measurement of close double stars, and cause these to be generally preferred in the examination of planetary details.

According to the plan of this work, the detailed treatment of the extensive subject of astronomy is given in the separate articles on the most important departments of investigation and instruments. The principal articles will be found under the following heads:

Aberration of Light.	Kepler.	Planets.
Acceleration.	Laplace.	Poles.
Altazimuth.	Lat. and Long.	Precession.
Aphelion.	Libration.	Ptolemy.

Readers may consult for further information Berry's *History of Astronomy* (1898); Grant's *History of Physical Astronomy* (1852); A. M. Clerke's *History of Astronomy during the 19th Century* (ed. 1908); Ball's *Story of the Heavens* (1885); Young's *General Astronomy* (1888); Moulton's *Introduction to Astronomy* (1907); Turner's *Astronomical Discovery* (1904); Bryant's *History of Astronomy* (1907); Dyson's *Astronomy* (1910).

Astruc, JEAN (1684-1766), born in Languedoc, became a distinguished professor of medicine at Montpellier (1717) and at Paris (1731), and wrote on midwifery and kindred subjects; but his most famous work (1753) was that in which, distinguishing between Elohistic and Jehovistic sources, he founded the modern criticism of the Pentateuch (q.v.).

Asturías was a northern principality of Spain, equivalent to the modern province of Oviedo (q.v.).

Astyages, the last king of Media, dethroned by Cyrus about 550 B.C. See MEDIA, CYRUS.

Asunción, or ASSUMPTION, capital of Paraguay (q.v.), stands on a terrace on the left bank of the Paraguay River, and is connected by rail (1911) with Buenos Aires, the Paraná being crossed by a train-ferry. It was founded in 1537, on 15th August, the feast of the Assumption. Pop. 100,000.

Asur, an ancient empire, its early capital, and its chief god; for all of which see ASSYRIA.

Asur-bani-pal, Asur-nazir-pal. See ASSYRIA.

Aswan. See ASSUAN.

Asylum. See SANCTUARY, INSANITY.

Asymptote (Gr., 'not coinciding'), a line that continually approaches nearer and nearer to some curve, but only meets it at an infinite distance. An example of an asymptote will be seen under HYPERBOLA. As another illustration, let AB be a straight line which can be produced to any length towards B. Take any point, C, without the line, and draw a perpendicular reaching to any distance, D, beyond the line; set off any equal distances, E-1, 1-2, 2-3, &c., along AB; and draw C1d, C2d', C3d'', &c., making 1d, 2d', 3d'', &c., equal to ED. Now it is evident that each of the points d, d', &c., is nearer to the line AB than the one to the

Asymptote.

left of it; if, therefore, a curve is traced through these points (the curve is called the *conchoid*), it must continually approach the line AB. On the other hand, it is evident that the curve can never meet AB at any finite distance; for a line drawn from C to any point in AB, however distant that point, must, when produced, cross AB. AB is thus an asymptote to the curve. To the senses, indeed, the curve and line soon become one, because all lines actually drawn have breadth. It is only of mathematical lines that the proposition is true; and the truth of it has to be conceived by an effort of pure reason, for it cannot be represented. An asymptote may also be curvilinear. For example, certain spirals have a circle as their asymptote. The spiral continually approaches the circle, but never meets it.

Atacama is a desert region in Chile, extending into Bolivia, and includes the Chilean province of Antofagasta and part of the province of Atacama. From the steep coast, almost inaccessible to ships, the land rises in rocky plateaus broken by precipitous mountain-chains, and inland reaches from 10,000 to 18,000 feet, many of the summits being volcanoes. Though lofty, it is not on the whole a mountainous country; in almost all parts of it there are salt marshes and lagoons. The rainfall

is very scanty and fresh water excessively scarce, so that only the hardest of desert plants are found on the bare rocky soil, which is mostly uninhabitable by human beings. The mineral wealth, especially in silver and copper, is great. Formerly the greater part of the desert belonged to Bolivia, but since the war of 1884 Bolivia retains only the small part incorporated with the province of Potosí, the remainder being ceded to Chile.—The northern Chilean province of Atacama, south of Antofagasta, is only partly desert, but is mostly stony, ill-watered, and barren. The area, without the sheer desert, is about 30,000 sq. m., with a population of 50,000. Copper and silver are largely wrought; gold, nickel, cobalt, and iron are also found; and salt, saltpetre, borax, and sulphate of lime are very abundant. Copiapó is the capital.

Atacamite, a basic chloride of copper, named from Atacama, where it has been found abundantly, but mined in other parts of Chile, in Saxony, and elsewhere. It occurs as a crust on the lavas of Vesuvius and Etna. The natural varieties of atacamite are crystallised, massive, and pulverulent or granular. It is a rich and productive ore, containing about 55 to 60 per cent. of copper. See COPPER.

Atacinus. See VARRO (PUBLIUS TERENTIUS).

Atahualpa, last of the Incas, was the favourite son of Huayna Capac, who died in 1525. The mother of Atahualpa not being of the pure Inca blood, her son was formally excluded from inheriting the throne; but on his death-bed the father assigned to Atahualpa the kingdom of Quito (recently conquered), while Huascar, his eldest son, obtained Peru. After some years, Huascar demanded homage for the kingdom of Quito, and war was declared between the brothers. In 1532 Huascar was completely defeated near Cuzco and taken prisoner. In the meantime, the Spaniards had disembarked; and after a perilous march through the unknown country, Pizarro, at the head of his two hundred cavaliers, approached the victorious camp of Atahualpa. By a daring but diabolical stratagem, Pizarro obtained possession of the person of the king, who had come by invitation to visit him in a friendly spirit. While a priest was explaining the Christian religion, at a sudden signal, the mysterious firearms poured death into the terrified masses of Peruvians, and the Spanish cavalry rode them down with merciless fury. Atahualpa, made a captive, agreed to pay an enormous ransom; but was accused of plotting against Pizarro, tried, and condemned to be burnt. On his agreeing to be 'baptised,' his sentence was commuted to death by strangulation (1533).

Atalan'ta, the name of two heroines in Greek mythology, often confounded with each other. (1) The Arcadian Atalanta, daughter of Iasus and Clymene. At her birth she was exposed by her father, who had wished for a son, but she was suckled by a she-bear, and grew up to be a maiden-huntress of marvellous courage and skill. She slew the centaurs who pursued her, afterwards sailed with the Argonauts to Colchis, and took a prominent part in the chase of the Calydonian boar. She had many suitors, but was merciless in the conditions which she imposed on them. Being the swiftest of mortals, she offered to become the wife of him that should outstrip her—the penalty of defeat being death. At length Milanion obtained from Venus three golden apples, which he dropped one after another during the race; and Atalanta was so charmed by their beauty that she could not refrain from stopping to gather them, and so lost. See Swinburne's *Atalanta in Calydon*. The

same story is told of (2) the Boeotian Atalanta, daughter of Schoenus and wife of Hippomenes.

Ataman. See HETMAN, COSSACKS.

Atargatis. See DERKETO.

Atavism (Lat. *atavus*, 'ancestor'), or REVERSION, the reappearance of ancestral instead of parental characteristics. (1) When two pure breeds are crossed, the hybrids often take after one of the two parents as regards the characters in which they were contrasted; and if these hybrids are bred among themselves, their offspring are sometimes divisible into three sets—a fourth of them like the grandsire, a fourth of them like the grand-dam, and half of them like the parent. In this we have a simple kind of reversion, which is known as Mendelian (see MENDEL). (2) When a number of different kinds of domestic rabbits of different colours are allowed to breed without restriction, there may be in the progeny in the course of time a general return to the colour of the wild rabbit which is the common ancestor. It is now generally believed, as the result of Mendelian experiments, that this kind of reversion is due to the coming together again of colour-factors which were sifted out in the formation of the various domesticated breeds. (3) Many believe, however, that reversion may also be due to the sudden reassertion of hereditary features which have lain for many generations latent. Thus a cross between a Shetland and a Welsh pony is described, in which tail, mane, and head had reverted to the type of Prjevalsky's horse of Central Asia. See DARWINIAN THEORY, HEREDITY, HYBRID, MENDEL, VARIATION, Darwin's *Animals and Plants under Domestication*, and Bateson's *Mendel's Principles of Heredity*.

Atawulf. See GOTHs.

Ataxia, LOCOMOTOR. See LOCOMOTOR ATAXIA.

Atbara, a tributary of the Nile, rises in Abyssinia near Lake Tzana, flows mainly north-west, and after receiving the larger Takazze, joins the Nile below Berber—being the only tributary of the Nile below the junction of the White with the Blue Nile. There on 8th April 1898 the Khalifa's forces were defeated by the Anglo-Egyptian army under Kitchener. The Sudan railway had just reached the Atbara in the summer of 1898. The extension to Khartum soon followed, and an iron bridge of 1200 feet in length now spans the Atbara. Another line (1905) runs to Port Sudan. See NILE, EGYPT.

Atchafalaya, an outlet of the Red River or of the Mississippi, which reaches the Gulf of Mexico at Atchafalaya Bay after a course of 220 miles.

Atchin (Dutch *Atjeh*), until 1873 an independent state in north-west Sumatra, now a province of the Dutch Indies, with an area of 20,500 sq. m., and a population of 700,000. The surface is divided into an eastern and a western half by the mountain-chain which traverses the whole island, and which rises in Abong-Abong to 11,000 feet. On both sides are numerous stretches of level or undulating soil, watered by small but deep streams, and admirably adapted for arboriculture, gardening, and the cultivation of rice. The flora and fauna agree with those of Sumatra generally; pepper and areca-nuts are characteristic. The natives employ themselves in agriculture, cattle-rearing, trade, fisheries, weaving cloth, and working in gold, silver, and iron. In appearance, dress, character, and manners, they are distinct from the rest of the inhabitants of Sumatra. Of darker colour and lower stature than the latter, they are also more active and industrious, good seamen and soldiers; but they are treacherous, revengeful, bloodthirsty, immoral, and inordinately addicted

to opium. Their ethnological place is not yet settled; their speech, according to Van der Berg, belongs to the Polynesian family.

The capital of the government is Kota Radja or Atchin, in the north-western extremity, situated on a stream navigable by boats, about $4\frac{1}{2}$ miles from its port Oleh-leh, with which, since 1876, it has been connected by a railway. Formerly a large and flourishing city, it was almost entirely destroyed during the war, but is now beginning to revive.

During the earlier half of the 17th century Atchin was a powerful sultanate, with supremacy over several islands and a part of the Malay Peninsula. Its power gradually declined; but an attempt was made by the treaty between the English and the Dutch in 1824 to reserve its independence. The inevitable war, however, broke out in 1873, and ended as inevitably, though not without a desperate resistance, in the conquest and annexation of the sultanate. The resistance was not wholly overcome till 1908; by 1895 it had cost £20,000,000 and 80,000 lives. See Snouck-Hugronje, *The Achenese* (trans. 1906).

Atchison, a city of Kansas, U.S., on the left bank of the Missouri, 333 miles above St Louis. It is an important railway centre, about a dozen lines converging here, one of them the Atchison, Topeka, and Santa Fé (New Mexico). The city has flour-mills, an iron-foundry, machine-shops, manufactures of furniture, carriages, and wagons, and an extensive general trade. Pop. (1870) 7054; (1890) 13,963; (1920) 12,630.

A té, according to Homer, the daughter of Zeus —of Eris, as Hesiod says—was a vengeful goddess, ever attending *dysnomia*, or transgression of law, though she herself prompted men to such. She was banished from Olympus by Zeus, whom she had incited to take an oath of which he subsequently repented. She then travelled to and fro over the earth with great rapidity, always intent on exercising a pernicious influence upon mankind. But her steps were followed by the goddesses *Litai* ('prayers'), benevolent daughters of Zeus, who healed those who had been afflicted by Ate. The tragic writers describe Ate as the goddess of retribution. Their representations almost identify her with Nemesis and Erinnyes. Of the greater tragedians she is most prominent in Æschylus, and least in Euripides, in whom the idea of *Dikē* ('justice') is more fully developed.

Ateles. See SPIDER-MONKEY.

Ateliers Nationaux, or NATIONAL WORKSHOPS, was the name given to the works which were organised by the Provisional Government at Paris in the spring of 1848, after the downfall of Louis-Philippe, and which were intended to give occupation to the unemployed at that time of disturbance. A permanent department was established, called *The Committee of the Government for the Workmen*. This establishment acted on the doctrine that the workmen were entitled to have a living provided for them on a certain uniform scale, which was fixed at two francs per day. It should be said, however, that the works were mostly unproductive, and therefore a mere burden on the national revenue. Of the crowds which flocked for employment, both from Paris and the provinces, many could not be provided with work of any kind, and had a dole of one franc a day given them. By the time a regular government had been established at the beginning of May (1848), the numbers thus engaged had increased to 130,000. As it had become a serious tax on the revenue, the government proceeded to break up the *workshops*, a measure which kindled into flame the discontent fermenting in the capital. The armed insurrection of the lower

classes of Paris which ensued, was put down by the national forces under Cavaignac only after the terrible fighting of the *Days of June*. The *ateliers nationaux* are generally, but quite inaccurately, confounded with the *ateliers sociaux* of Louis Blanc (q.v.).

Atellane, *Fabulæ Atellanæ* (also styled *Ludi Osci*), a kind of popular drama in Rome, first introduced from Atella, a town in Campania, between Capua and Naples. After the Greek drama had been brought to Rome by Livius Andronicus, the old *Fabulæ Atellanæ* were still retained as interludes and after-pieces. They are not to be confounded with the Greek satiric drama, although the character of both was to some extent the same. In the latter, satyrs figured; while the former personated real Oscan characters. The *Macrus* and *Bucco* of the *Fabulæ Atellanæ* may be considered the origin of the modern Italian *arlechino* (harlequin), and other characters of the same stamp. They were the favourite characters; spoke the Oscan dialect, and excited laughter by its quaint old-fashioned words and phrases. The *Atellanæ* were neither so dignified as the *comœdia prætextata*, nor so low as the *comœdia tabernaria*, but were characterised by a genial and decent drollery. The caricature was at first always pleasant, and though quizzical, it did not lapse into obscenity, like the *mimi*. Respectable Roman youths, who could not appear as actors in the regular Greek drama without losing caste, were allowed to take parts in the *Atellanæ*. They were commonly divided into five acts, between which were frequently inserted the *exodia*, old-fashioned and laughable interludes in verses. The latter also were played by young and well-born Romans.

See the fragments in Ribbeck's *Scenice Romanorum Poesis Fragmenta* (1874; collected after Bothe and Munk); Munk, *De Fabulis Atellanis* (1840); and the articles *FABOE*, *DRAMA*.

Ateshga ('place of fire'), a spot about a mile in diameter, on the peninsula of Apsheron, on the west coast of the Caspian Sea. It was considered sacred by the Guebres, or Persian Fire-worshippers, some of whom used till recently to visit it, and bow before the holy flames which issued from the bituminous soil. The site of a former temple of this sect is now occupied by large petroleum works, where the natural gas is utilised for fuel for the vast retorts.

Ates'sa, a town of South Italy, 23 miles SSE. of Chieti. It has a beautiful collegiate church, and some woollen manufactures. Pop. 5000.

Aten/chus. See SCARABEUS.

Ath, or **AATH**, a fortified town in the province of Hainault, Belgium, on the navigable Dender, 32 miles SW. of Brussels. It has a lofty tower dating from 1150, an arsenal, hospital, and college, important manufactures of linen, calicoes, lace, &c., and a brisk trade. Pop. 11,000.

Athabasca (locally *La Biche*, 'red-deer or elk river'), a river and lake in the Canadian provinces of Saskatchewan and Alberta, forming part of the great basin of the Mackenzie. The river rises in the Rocky Mountains, in a little lake at the foot of Mount Brown, one of the highest points in the range. Its general course is NE., till, after crossing the west end of Lake Athabasca, it turns towards the NW., and unites with the Peace River, from beyond the Rocky Mountains, to form the Slave River, which, again, after passing through Great Slave Lake, takes the name of the Mackenzie. Length of the Athabasca, over 600 miles; or about 2000 miles for the entire river system. The Athabasca-Mackenzie affords magnificent facilities for navigation; and between it and

the Winnipeg system there is but one portage of 50 miles. *Lake Athabasca* receives nearly all its waters from the *Athabasca River*; and its principal feeder traverses not its length but its breadth, and that not in its middle, but at its extremity. The lake's sole outlet is the river *Athabasca*. It is about 230 miles long, and from 14 to 30 broad. It was discovered in 1771 by Samuel Hearne, and named by him *Lake of the Hills*. Trading stations were soon afterwards established on its shores. A silting-up process has been going on, from its numerous water-courses. — **ATHABASCA** was the name of one of the four divisions of the Canadian North-west, as defined in 1882, between British Columbia and the 100th meridian of W. long. It contained the fertile *Peace River* district. In 1905 it was abolished (as also *Assiniboia*) and its territory divided between the two newly delimited provinces of Alberta and Saskatchewan (q.v.).

Athaliah, daughter of Ahab, king of Israel, and queen of Jehoram of Judah, whose usurping and bloody reign (2 Kings xi.; 2 Chron. xxii., xxiii.), put an end to by Jehu, was the subject of a tragedy by Racine and an oratorio by Handel.

Athanaric was a ruler of the Visigoths who fought unsuccessfully with Valens (369), and, defeated by the Huns (376), took refuge with Theodosius, only to die a fortnight after his reception in Constantinople (381). See GOTHs.

Athanasian Creed—more accurately described in the rubric of the Prayer-book as 'the Confession of our Christian Faith commonly called the Creed of St Athanasius'—is one of the doctrinal standards of the Western Church, and was preserved by the Reformed Church of England. It is appointed to be 'sung or said at Morning Prayer, instead of the Apostles' Creed,' on thirteen festivals, including Christmas, Easter, and Whitsunday. The 8th Article declares that 'Athanasius's Creed,' together with the Nicene Creed and 'that which is commonly called the Apostles' Creed,' 'ought thoroughly to be received and believed, for they may be proved by most certain warrants of Holy Scripture.' When in the 17th century its Athanasian authorship was finally abandoned no slight wound was inflicted on its prestige, and the objections which its 'damnatory' or 'monitory' clauses naturally provoked in Christian minds were the more freely expressed. Its obvious unfitness for use as a congregational formulary could not but appeal to a clergy trained in the pastoral tradition of the English Church.

Waterland's conclusions are now endorsed by students both at home and abroad, and his treatise, *A Critical History of the Athanasian Creed* (1723), remains the completest work on the subject. It is now agreed that the *Quicumque Vult* must be referred to the 6th, perhaps even to the 5th, century; that it was composed in its present form in Gaul, almost certainly by a member of the famous monastery of Lerins; that it was primarily designed as a didactic formulary for the use of the clergy; that it came into more public use first as a 'psalm' or 'canticle,' and thus found its way into the service-books of the Western Church; that it was originally anonymous, but at an early date was ascribed to Athanasius, obviously because his name was symbolic of orthodoxy as opposed to heresy; that the credit of this great name enhanced its authority and facilitated its acceptance; that in the course of the middle ages repeated efforts were made to popularise it by means of vernacular and metrical renderings for the use of the laity; that its liturgical use was restricted to the monastic offices until the Reformation, when for the first time its public recitation by general congregations was ordered by the rubrics of the Prayer-book.

The Church of England and the Colonial churches immediately dependent on it alone require the public recitation of the creed. In Ireland the disestablished church removed the rubric ordering its public use, but retained the creed in the Prayer-book. The Protestant Episcopal Church in the United States of America has removed the creed altogether from its Prayer-book, and amended the 8th Article accordingly. In the Church of England the chronic controversy as to the public use of the creed entered on a new phase since the issue of Royal Letters of Business to the Convocations authorised an attempt to revise the Prayer-book. The Upper House of the Southern Convocation in 1905 passed resolutions as follows: '1. That this House is resolved to maintain unimpaired the Catholic faith in the Holy Trinity and in the Incarnation, as contained in the Apostles' and Nicene Creeds and in the *Quicumque Vult*, and regards the faith thus presented, both in statements of doctrine and in statements of fact, as the necessary basis on which the teaching of the church reposes. 2. That this House, . . . while it believes that this scriptural truth is what the minatory clauses of the *Quicumque Vult* were primarily intended to express, acknowledges nevertheless that, in their *primæ facie* meaning and in the mind of many that hear them, those clauses convey a more unqualified statement than Scripture warrants, and one which is not consonant with the language of the greatest teachers of the church.' The Pan-Anglican Conference at Lambeth (1908) resolved as to the liturgical use of the *Quicumque Vult*, 'that, inasmuch as the use or disuse of this hymn is not a term of communion, the several churches of the Anglican communion may rightly decide for themselves what in their varying circumstances is desirable; but the Conference urges that, if any change of rule or usage is made, full regard should be had to the maintenance of the Catholic faith in its integrity.' In accordance with another resolution, the Archbishop of Canterbury in 1909 appointed a committee of 'seven eminent scholars and theologians,' under the chairmanship of the Bishop of Salisbury (Dr John Wordsworth), to provide a new translation based on the best Latin text, published in 1910. A committee of the Lower House of the Southern Convocation recommended that the rubric be made optional—a proposal rejected by the House in 1909.

Both sides in the controversy have become more uncompromising. Objection is now taken to the 'damnatory clauses,' not merely as being crude and lacking in charity, but as being false. The relatively barbarous character of 6th and even 5th century Christianity is insisted upon, and the authority of an alleged Catholic consent is traversed by the indictment against the whole spirit and policy of intolerant orthodoxy. Nor is objection limited to the 'damnatory clauses,' but extends to the conception of 'the Catholic faith' as essentially a dogmatic scheme, and not, as the New Testament appears to teach, a spiritual attitude involving moral fidelity. The intellectual tendencies of the age are no longer moving in the direction of theological definition, and the creed seems to answer to no evident or realised demand. On the other hand, the champions of the creed are able to draw to their side the large amount of disturbed conservative opinion which has been alarmed by the rapid progress of critical doctrines as to Scripture, and the resultant innovations in traditional beliefs. And they appear able to command a certain sympathy among the more advanced historical critics, who find less cause for disliking the *Quicumque Vult*, which is mainly metaphysical, than either the Nicene or the Apostles' Creed, which are mainly historical.

Meanwhile the practical question seems to be

solving itself. In a third of the parish churches it is alleged that the rubric is regularly disregarded, the creed being never read; in a large and increasing number of churches the creed is read at a service which has ceased to be popular, and thus has returned to something like its medieval position, when it was only rehearsed at the monastic office of Prime. The real difficulty now is no more with the congregations but with the ordination candidates; but even here the situation is not so acute as it was.

See Waterland, *A Critical History of the Athanasian Creed* (1723); Swanson, *The Nicene and Apostles' Creeds*, &c. (1875); three works on the Athanasian Creed by Ommanney (1875-97); books on it by Burn (1896 and 1899), and also by Robinson (1905), Jayne (1905), and Emery Barnes (1905); Gibson, *The Three Creeds* (1909).

Athanasius, bishop of Alexandria and champion of Christian orthodoxy, was born, apparently in Alexandria, about 293 A.D., and seems to have been brought up under the immediate supervision, if not in the house, of Alexander, bishop and patriarch of Alexandria. He was archdeacon when he accompanied his bishop to the council of Nicea (325 A.D.), helped (though not a member) to move the council to decide against the views of Arius (q.v.), and to mould that definition of the Christian faith of which he was to be the protagonist. See CHRIST, CREEDS, TRINITY.

His patron, Alexander, having died in the following year, he was duly elected to the primacy by the clergy and people; and was but newly installed in his office, when Arius, who had been banished at the time of the condemnation of his doctrine at Nice, was recalled, and made a recantation of his erroneous principles. Athanasius, it is said, refused on this occasion to comply with the will of the emperor that the heretic should be restored to communion. On this account, and in consequence of several other charges brought against him by the Arian party, he was summoned by the Emperor Constantine to appear before the synod of Tyre, in 335 A.D., which deposed him from his office. The sentence was confirmed by the synod of Jerusalem in the following year, when he was banished to Augusta Trevirorum (Treves). In 338, however, he was recalled from his banishment, and restored to the primacy at Alexandria. His entrance into the city was like a triumphal procession; but the Arians soon rose against him, and (in 341) he was again condemned by a council of ninety-seven (mainly Arian) bishops, assembled at Antioch. Against this decision a protest was made by a hundred orthodox bishops at Alexandria; and in a council held at Sardica, 300 bishops, countenanced by Julius, Bishop of Rome, confirmed the decision in favour of Athanasius, who was again replaced in his office (349). The Arians once more acquired the ascendancy after Constantius (in 353) had been made emperor of both the East and the West; for in that year Athanasius was condemned by a council held at Arles, and the sentence was confirmed by another held at Milan in 355, the influence of the sovereign being strongly exerted to secure his condemnation. As the resolute patriarch had declared that he would not leave his place without an express order from the emperor, violent means were resorted to for his expulsion. While engaged in conducting divine service, he was interrupted by a company of soldiers, from whom he made his escape into the Egyptian desert. A price was set on his head; and to avoid his persecutors, he retired from the usual haunts of the anchorites to a remote desert in Upper Egypt, where he was attended by but one faithful follower. Here he wrote several works to confirm orthodox Christians

in their faith. On the accession of Julian to the imperial throne, toleration was proclaimed to all religions, and Athanasius returned to his former position as Patriarch of Alexandria (361). His next controversy was with the heathen subjects of Julian, to whom the patriarch, by his zeal in opposing their religion, had made himself very offensive. To save his life, he was compelled again to flee from Alexandria, and remained concealed in the Theban desert until 363, when Jovian ascended the throne. After holding office again as patriarch for only a short space of time, he was expelled anew by the Arians, under the Emperor Valens. Athanasius now found refuge in the tomb of his father, where he remained hidden four months, until Valens, moved by petitions from the orthodox Alexandrians, restored the patriarch to his see, in which he continued till his death in 373 A.D.

Athanasius was the leading ecclesiastic during the most trying period in the history of the early Christian Church. His ability, his conscientiousness, his judiciousness and wisdom, his fearlessness in the storms of opposition, his activity and patience, all mark him out as a conspicuous ornament of his age. Though twenty years of his life were spent either in exile, or what was equivalent to it, yet his prudence and steadfastness, combined with the support of a large party, crowned his exertions with complete success.

His writings are polemical, historical, and moral; the polemical works treat chiefly of the doctrines of the Trinity, the incarnation of Christ, and the divinity of the Holy Spirit. The first edition of his works in Greek (2 vols. folio) appeared in 1600; better are those by Montfaucon (1698) and Migne (1860). Some of the treatises were translated by Parker (1713), Whiston (1713), and Newman (1842). See the church histories; Harnack's *History of Dogma*; Stanley's *Eastern Churches*; also works on Athanasius by Mohler (2nd ed. 1844), Bohringer (2nd ed. 1874), and R. W. Bush (1888); Bright's edition of the Orations against the Arians; A. Robertson's *Select Works and Letters of Athanasius* (1892); Bright's article in Smith's *Dict. Eccles. Biog.*, and the articles in Hauck-Herzog (1897) and the *Catholic Encyclopedia* (1907); also the article ARIUS and works there quoted.

Atheism is the doctrine that there is no God. But it makes all the difference whether a man actually professes atheism, or whether he is merely charged with atheism by his opponents. There are atheists who have distinctly denied the existence of God; very many more have only refused to believe in a god or gods because the difficulties in the way of that belief were in their mind stronger than the arguments in favour of it. But the vast majority of those who have been charged with atheism repudiated the impeachment. Their enemies usually insisted that their opinions implied disbelief in the god or gods whom their neighbours worshipped. 'Infidel' and 'atheist' sank to terms of abuse for heretics; in the last resort a man might be called a 'practical atheist' if he abstained from the religious rites the majority held to be incumbent. Socrates was accused of atheism; so were the early Christians because they denied the pagan gods. Thomas Paine, a resolute theist, was constantly called an atheist; J. G. Holyoake, a secularist, was the last man imprisoned on a charge of atheism in England (1841); Bradlaugh did not always reject the name of atheist, but both he and Ingersoll were rather agnostic freethinkers than atheists. The word atheism, which first appears in English literature in the latter part of the 16th century, is used as if familiar in Bacon's works. The name atheist is said to have been first applied in Greek literature to one of the followers of the materialistic philosopher Democritus (q.v.). It used to be doubted by

such men as Bacon, Addison, and Dr Arnold whether a real atheist ever existed. According to Spencer and Gillon many of the central Australian tribes are professed atheists. The children are taught to believe in a great all-powerful spirit; but the boys at initiation are warned that there is no such being—that it is a myth invented by the men to frighten and keep in order the women and children. The ancient Greeks banished the recognised abettors of atheism with this stigma attached to them, the names of men who did not believe in the gods. In recent and modern times such men as La Mettrie, Von Holbach, Feuerbach, and Gustave Flourens—to name no others—have advocated this doctrine in the most explicit manner; and when, for example, Feuerbach says: 'It is clear as the sun, and as evident as the day, that there is no God;' or, when Flourens wrote these words: 'Our enemy is God' . . . 'Hatred of God is the beginning of wisdom' . . . 'If mankind would make true progress, it must be on the basis of atheism,' there seems no reason to doubt that their language may be regarded as expressing their real sentiments.

There are three forms of argument employed in the advocacy of atheism—viz. the *dogmatic*, which positively asserts that there is no God; the *sceptical*, which maintains that the finite mind of man is incapable of ascertaining whether there is a Divine Being or not; and the *critical*, which holds that the evidences adduced in support of Theism (q.v.) are inadequate. The first of these—the dogmatic—has now fallen largely into disrepute. In Britain, this is largely owing to the trenchant reasoning of John Foster, and subsequently of Dr Chalmers. These writers set themselves to show that dogmatic atheism is a palpable absurdity. Before any man is entitled to assert that there is no evidence of the existence of God, he must, they argue, explore all parts of the universe; for evidence that would convince even *him* may be extant somewhere. To prove a negative is proverbially difficult; but to prove *this* one, nothing short of omniscience and omnipresence would be requisite. Modern non-believers in the existence of God cautiously restrict themselves to the sceptical and the critical methods, and, instead of positively asserting that there is no God, they argue in favour of Agnosticism (q.v.). The relation of atheists to oaths in courts and in parliament is discussed at OATHS. See also APOLOGETICS, RELIGION, MATERIALISM, POSITIVISM, SECULARISM.

Atheling (Old Eng. *Æthel*, 'noble'), a title of honour among the Anglo-Saxons, which, at first applied to the descendants of the primitive nobles of the first settlement, gradually became confined to the princes of the blood royal, and, in the 9th and 10th centuries, exclusively to the sons and brothers of the reigning king.

Athelney, ISLE OF, a marsh at the junction of the rivers Tone and Parret, in the middle of Somersetshire, about 7 miles from Taunton. Here Alfred hid himself for nearly a year when driven from his throne by the Danes in 878, and here he founded, in 888, a Benedictine abbey, now entirely gone. Among the many relics found in this spot is a jewel of Alfred's, preserved in the Oxford Museum. The name Athelney means 'island of the nobles,' or 'royal island.'

Athelstan, son of King Edward the Elder, and grandson of Alfred the Great, was born about 895 A.D., and was crowned king of the Mercians and West Saxons at Kingston-upon-Thames in 924. He conquered portions of Cornwall and Wales, and, on the death of Sihtric, king of Northumbria, who had married one of his daughters, made his successor tributary. In 937,

a league, composed of Welsh, Scots, and Danes, was formed against him; and a fierce and decisive battle was fought at Brunanburh (q.v.), in which the allies were utterly defeated, and which became famous in old English song. After this, the reputation of Athelstan, now practically king of all England, spread into the Continent; one of his sisters married Otto the Great, afterwards emperor; another, Hugh, Duke of the French, father of Hugh Capet. At home he exhibited a deep interest in the welfare of his people, improved the laws, built monasteries, and promoted commerce. He died in 939.

Athena, or PAL AS ATHENA, one of the greater Greek divinities, forming, with Zeus and Apollo, the supreme triad in Greek mythology. Of her origin and parentage different accounts are given, probably from the confusion of various local legends; but the best-known version of the myth represented her as the daughter of Zeus and Métis. Zeus, we are told, when he had attained supreme power after his victory over the Titans, chose for his first wife Métis ('wisdom'); but being advised by both Uranus ('heaven') and Gæa ('earth'), he swallowed her when she was pregnant with Athena. When the time came that Athena should have been born, Zeus felt great pains in his head, and caused Hephestus (Vulcan) to split it with an axe, whereupon the goddess sprang forth—fully armed, according to the later stories. Under the gross accretions which conceal the significance of the myth, we may see in this account of Athena's parentage an effort to set forth a divine symbol of the combination of power and wisdom. Her father was the greatest, her mother the wisest of the gods. She is literally born of both, and so their qualities harmoniously blend in her. She is the personified reason, the wisdom of the divine father; while Apollo, no less beloved of Zeus, is his mouth, the revealer of his counsel. She is a maiden goddess, everlastingly young and fair. Though her heart is inaccessible to the passion of love, she is not a cold unfeeling divinity, but interests herself warmly in the affairs of both gods and men. She is the patroness of agriculture, the inventor of the plough and rake, the first to introduce the olive into Attica, and (in harmony with her character as the personification of active wisdom) to teach men the use of almost all the implements of industry and art; and she is said to have devised nearly all feminine employments. Philosophy, poetry, and oratory are also under her care. She is the especial patroness of the Athenian state, protects its liberties by her power and wisdom, maintains the authority of law and justice in her courts, and was believed to have instituted the court of justice on Mars' Hill (the Areopagus). The industries of its citizens are dear to her—she is the 'workmistress' (*Erganè*), the goddess of all useful and elegant arts. As a warlike divinity, she approves of those wars only which are undertaken for the public good, and conducted with prudence; and thus she is regarded as the protectress in battle of those heroes who are distinguished as well for their wisdom as their valour. In the Trojan wars she favoured the Greeks, and in the war of Zeus against the giants she assisted her father with her counsel, killed the giant Pallas, and buried Enceladus under the island of Sicily. Her worship was universal in Greece, and representations of her in statues, busts, coins, reliefs, and vase-paintings are numerous. She is always dressed, generally in a Spartan tunic, with a cloak over it, and wears a helmet adorned with figures of different animals; her ægis, the round Argolic shield, has in its centre the head of Medusa. Her countenance is beautiful, earnest, and thoughtful, and the whole figure

majestic. One of the two masterpieces of Phidias was his great statue of the virgin Athena, on the Parthenon at Athens. In it were combined chastity with gentleness, victorious strength with calm peace, profound wisdom with perfect simplicity. It was not only a production of the highest art, but at the same time the expression of a profound religious idea. From Greece her worship was carried to greater Greece, and many temples were erected in her honour. In Italy proper she was identified with Minerva, a native goddess of wisdom, and worshipped with Jupiter and Juno.

Athenæum (Gr. *Atēnaion*), originally a Temple of Athena (Lat. *Minerva*), afterwards a kind of college or institution for higher education. The first at Rome was that founded by the Emperor Hadrian about 133, for the study of poetry and rhetoric, with a regular staff of professors. It existed as the *Schola Romana* until the 5th century. Similar institutions flourished in the provinces also, as at Lyons and Nîmes. Theodosius II. founded one at Constantinople for the eastern world. In modern times the name has been revived as an appellation for certain literary institutions, as that at Marseilles, and also as a collective title for literary essays and reviews. The weekly journal of literature, science, and art (monthly, January 1916–April 1919), published in London from 1828, was combined with *The Nation* in 1921. See CLUBS.

Athenæus, a Greek writer, born at Naucratis in Egypt. He lived first at Alexandria and afterwards at Rome about the close of the 2d and beginning of the 3d century. His work, entitled *Deipnosophistæ* ('Banquet of the Learned'), in fifteen books, but of which we possess only the first two, and parts of the third, eleventh, and fifteenth, in an abridged form, is very interesting as one of the earliest collections of *Ana*. It consists of extracts from more than 1500 books, put in the form of table-talk at an imaginary banquet, at which Galen the physician and Ulpian the jurist are among the guests. Every possible subject is introduced and illustrated by fragments from the poets, dramatists, and philosophers; but of the learned author's thousand and one interests, gastronomy seems to have been the dearest. But he loved 'titbits' of scandal no less than of cookery, for he tells many stories to the discredit of people whom history praises, which of course we are not by any means bound to believe. His dialogue is prolix and lumbering; and his work is not irradiated by a single gleam of genius, and has only achieved immortality through being a storehouse of miscellaneous information that otherwise would have been lost. The best editions are by Schweighäuser (14 vols. 1801–7), Dindorf (3 vols. 1827), Meineke (4 vols. 1859–67), and Kaibel (1887–90). An English translation was published in 1854.

Athenag'oras, an early Christian philosopher, who taught first at Athens, and afterwards at Alexandria. He is the most elegant writer among the so-called apologists in the second half of the 2d century, and we possess two writings from his pen—his *Legatio pro Christianis*, addressed to the Emperor Marcus Aurelius and his son Commodus, composed about 163, and *De Resurrectione Mortuorum*, written about 180. In these he defends the Christians against the heathen charges of atheism, incest, and cannibalism with great clearness and convincing power.

Athena'is, an Athenian lady of distinguished beauty and learning, who in 421 A.D. became the wife of the Emperor Theodosius II., and assumed the name of Eudocia (q.v.).

Athens, capital of old Attica, metropolis of ancient Greek culture, and still capital of the republic of Greece, seems to have derived its name from Athena (q.v.), 'goddess of science, arts, and arms,' who from earliest times was the patron divinity of the city. Cecropia, from the mythical king and hero Cecrops, the city was also called in ancient times.

Athens owes its original location, doubtless, to the craggy rock known as the Acropolis (q.v.), that rises about 230 feet above the Attic plain, and that in earliest days served for citadel as well as for residence and site of sanctuaries. With the growth of the population, the parts below and adjacent to the Acropolis, especially on the western and southern slopes, became inhabited. Possibly prior to the occupation of the Acropolis and before what is known as the Mycenaean age, there was a settlement on the seaward slopes of the hill known as the Pnyx, numerous remains of which, in the form of cellars, cisterns, graves, steps, seats, all cut into the native rock, are still to be seen, constituting what is generally known as 'The Rock City.' This settlement (not now held to have been Phœnician) was in later times never wholly deserted. It appears to have been included within the circumference of the city walls, and at the time of the Peloponnesian war, when the people of Attica sought shelter within the fortifications, this quarter must again have been thickly inhabited.

To understand the subsequent history and growth of Athens, it is necessary first to take into view the natural advantages of its position. Few cities, if any, can boast a more beautiful situation.

The Attic plain, which immediately surrounds the city on the east, north, and west, is bounded by the range of Hymettus (3363 feet), famous for its purple tints, on the east; by Pentelicus (3641 feet), noted for its quarries of marble, rich even to-day, on the north-east; by the range of Parnes (4634 feet), well wooded at the base, but barren at the summit, on the north; by the lower and nearer range of Corydallus (1535 feet), extending to the bay of Salamis, on the north-west; and on the west and south by the Saronic Gulf, in whose waters lie, in plain sight, the islands of Salamis and Ægina. The site of the city is itself diversified by several hills which add greatly to the beauty of the scenery.

Standing upon the Acropolis one sees to the east Mount Lycabettus, a conical-shaped mount 911 feet high, on whose summit Zeus once had a sanctuary where now stands a small chapel dedicated to St George, the patron saint of the modern Greeks. To the south-west rises the hill of the Muses, or the Mouseion, surmounted now by the ruins of a monument to Philopappus, who was Roman consul about 100 B.C. In the side of the Mouseion are three rocky chambers, doubtless ancient sepulchres, but popularly known as the 'Prison of Socrates,' according to a tradition that goes no farther back than the middle ages. Immediately adjacent to this is a lower eminence called the hill of the Pnyx, from the fact that on its slope tradition locates the place of popular assembly. At the upper end of the terrace, which is supported below by a wall of polygonal masonry, stands a cube of rock surrounded at the base by steps. This is now generally held to be the famous *bēma* or tribune of the assembly, from which the orators addressed the people occupying the semicircular area below, which must originally have had a slope the reverse of the present and resembled the usual inclination of the surface of the theatre.

Just below the western foot of the Acropolis lies the rocky hill called the Areopagus or hill of Ares (Mars), so named from the myth according to which Ares was tried for the murder of Hallirotchios before the twelve gods of Olympus, who held court on this

eminence. It was here that the most venerable court of Athens had its sittings to try cases of wilful murder, to exercise judicial censorship over the life of the citizens, and to guard the sanctity of

ancient law and tradition, particularly such as pertained to religion. Before this court it is generally believed that the apostle Paul delivered his vindication of the Christian faith recorded in Acts, xvii. Just beyond the Areopagus, with a narrow valley between, lies the Hill of the Nymphs, once occupied by sanctuaries and dwellings, and now the site of the astronomical observatory. The view beyond includes the harbours of Phalerum, Munychia, Zea, and the Piræus (q.v.). The superior position and greater extent of the last-named harbour have made it, ever since the days of Themistocles, the seaport of Athens. To the south and east of the city flows the Ilissus, and to the north and west the less celebrated but more copious Cephissus. In the summer both streams are nearly dry, and at no time are they large enough to deserve the name of river. They are of great value, however, in the winter and spring for irrigating the vineyards and olive-groves that cover the plain. The most famous spot in the plain is the grove of the hero Academus, situated about a mile north-west of the city, where the 'divine Plato' taught his philosophy and founded his school, which has become famous under the name of the *Academy* (q.v.). Adjoining this grove is a knoll called Colonus, in the ancient *dēmos* of that name, famous as the birthplace of the tragic poet Sophocles, who celebrates the beauty of this region in one of the finest of the odes in his tragedy of *Œdipus at Colonus*. On this hillock are the tombs of two of the most distinguished of modern archaeologists, Ottfried Muller and Charles Lenormant.

That a city so beautifully situated, enjoying a delightful climate the greater part of the year, under a sky wonderful for its clearness (as Euripides says of the Athenians of old, 'marching through an ether of surpassing brightness'), inhabited by a race so gifted as were the ancient Ionian Greeks, should play an important rôle in history, is not at all surprising. The history of the city may be most conveniently narrated by dividing it into four epochs: (1) The period from the time of Cecrops

to the battle of Plataea, 479 B.C. (2) The most flourishing period of Athens, extending to the close of the Peloponnesian war, 403 B.C. (3) The decline of Athens, embracing the Alexandrian, Roman, Byzantine, Frankish, and Ottoman periods. (4) Modern Athens.

(1) The oldest history of Athens as a city is connected with the reforms of Theseus and Solon. Theseus was a mythical hero to whom, as his name may indicate, was attributed the credit of organising the scattered population of Attica into communities and of instituting several of the most important Athenian festivals. At this time the Acropolis was the abode of the king and the priests, and was the site of the Prytaneum or town-hall, as well as of the sanctuaries and altars of Athena, Erechtheus, Zeus, and Poseidon.

In the 6th century B.C., under the reforms of Solon and the fostering hand of the tyrant Pisistratus, Athens fairly began her prosperous career. Amid much that is mythical in the history of the reforms of Solon, it is certain that he gave a new place to the *dēmos* as the unit and centre of political life, and to the *ecclesia* or popular assembly, before which all acts of government were to be brought for discussion and approval. By him also the populace was divided for political purposes on a property basis into four classes, of which the first three were eligible to office. At this time the chief rule was already lodged in the hands of nine archons who were chosen annually. To the family of Pisistratus Athens owes the earliest structures that were at all beautiful or imposing. On the Acropolis Pisistratus adorned the ancient temple of Athena with a portico. Some remains of this structure, which was destroyed by the Persians, are still seen built into the northern wall of the Acropolis. The foundations of a temple exhumed (1885-88) between Parthenon and Erechtheum were identified by Dörpfeld as belonging to this ancient sanctuary. Still more imposing was the temple begun by Pisistratus on the bank of the Ilissus in honour of Olympian Zeus, and ever since known as the Olympieum. Within a peribolus of four stadia a structure was reared whose dimensions afterward became 354 feet in length, 171 in breadth, and which when completed was adorned with 120 columns of Pentelic marble, 60 feet in height and 6 feet in diameter. The ruins of this colossal temple, consisting of 16 columns, most of which have an architrave, form one of the most impressive sights of Athens.

The reforms of Clisthenes in 506 B.C. gave the government of Athens a still more democratic form by making all citizens eligible to office, by enlarging the authority of the popular assembly, and by creating popular courts of justice. Doubtless these reforms stimulated the erection of new buildings for the use of the state, many of which were located about the ancient Agora, whose exact situation has been a matter of much dispute until this very day. The conflict with Persia which originated in the Ionic revolt and the destruction of Sardis in 499 B.C., indirectly led to the naval supremacy of Athens, under the wise guidance of Themistocles. In 480 B.C. the Athenians abandoned their city to the ruthless vengeance of the Persian invaders, who burnt and destroyed all its houses and temples.

(2) After the victories of Salamis and Plataea, the Athenians splendidly rebuilt their city, which now entered upon the most brilliant epoch of its career. Under the leadership of Themistocles, Cimon, and Pericles, Athens reached the zenith of her power, and became fortified by numerous walls and bulwarks, and beautified by the erection of splendid temples. To this period belong the walls around the Acropolis, and the city walls with their ninety-seven towers and ten gates, measuring a

circumference of forty-three stadia, or almost five miles. The chief gate was at the north-west, and led to the Academy. It was called the Dipylon or double gate, and its form may still be seen from

Map of the Country round Ancient Athens.

the foundations which have been brought to view by excavation. Just outside of this gate was the Ceramicus ('Potter's field') or ancient cemetery, where one sees to-day some of the most

beautiful sepulchral reliefs known to art. For the better defence of the city and of its harbour, Piræus, the famous 'long walls' were built by Themistocles, Cimon, and Peicles. Together with the fortifications of the Piræus, which had previously been built by Themistocles, they formed a complete fortress, sometimes denominated, on account of its length, which was about five miles, the 'Long Fortress.' The enclosure between the two parallel walls was for the larger part of the way about 550 feet wide, and formed a continuous broad street between the city and its port. Traces of these walls are still to be seen. The age of Peicles in Athenian history corresponds to the Elizabethan period in the history of England. Among the great names of this illustrious period may be mentioned Mnesicles and Ictinus in architecture, Phidias and Polyclitus in sculpture, Polygnotus and Parrhasius in painting, Æschylus and Sophocles in tragedy, Aristophanes in comedy, Pindar and Simonides as lyric poets, and Herodotus and Thucydides as historians. Of the monuments of this period the most important are the Parthenon (q.v.), the Erechtheum, the Temple of Wingless Victory (*Nikē Apteros*), the Propylæa, the Theseum, and the statues and reliefs that adorned these structures. It is

View of the Acropolis of Athens from the Mouseion Hill, showing the ruins of the Parthenon and the Propylæa.

The hill to the right is Lycabettus.

from the contemplation of these ruins and remains that the beholder gains such a conception of the purity and exquisite grace of ancient art as he can get nowhere else. The simplest and most majestic structure of all is the Parthenon, built in the Doric style, and richly ornamented with polychromatic colouring. Its cella contained the chryselephantine statue of the virgin goddess from the hand of Phidias. Its pediments were adorned with groups of statuary representing the birth of Athena, and the contest of Poseidon and Athena for the possession of Attica. The frieze around its cella wall portrayed the procession of the Panathenaic festival. Of these sculptures the

largest part of what has been preserved was carried by Lord Elgin to the British Museum, where the collection is known as 'the Elgin Marbles' (q.v.). The temple first became a ruin in 1687, through the bombardment of the Venetians, one of whose lieutenants had the wretched good luck to send a bomb into the powder stored by the Turks in the cella. Shattered and battered though it is, the Parthenon is doubtless the most beautiful ruin in the world. Of the Erechtheum, which was built in the Ionic style, and which has a form entirely different from that of any other known temple, the most beautiful part, the so-called 'Porch of the Caryatides,' is still in fair state

of preservation, and shows six graceful female figures supporting the architrave. The Propylaea, which formed the entrance to the Acropolis, consisted of three parts—viz a central porch with five gates, and a north and south wing. It was the most massive secular structure of ancient Athens, but, probably through the distractions and expenditures of the Peloponnesian war, was never completed. Contiguous and in front of the south wing of the Propylaea is the Temple of Wingless Victory, built in the Ionic style and of Pentelic marble. On a slight elevation north-west of the Acropolis stands the so-called Theseum, the best preserved of all the structures of the ancient city. It was built somewhat earlier than the Parthenon, is also of the Doric order, and derives its name from the tradition that here the remains of Theseus were brought from the island of Scyros and interred. Most modern scholars believe it was a temple of Heracles or of Hephaestus. In the middle ages it served as a Christian church dedicated to St George. The gold brown tint of the weather-stained Pentelic marble presents, in the glow of the rising or setting sun, a peculiarly beautiful effect.

In an out of the way corner, south-east from the Acropolis, amid squalid surroundings, stands the graceful Choriagic Monument of Lysicrates. This monument owes its origin to the custom of dedicating the tripods given in the Dionysiac contests to the victorious chorus. It is in the form of a small circular temple, which served as the base of the tripod, and is one of the earliest specimens of the Corinthian architecture. On the south slope of the Acropolis was the sanctuary of Dionysus, where later was built the great theatre, the remains of which, consisting of seats hewn into the rock, marble thrones, pieces of a later proscenium, and other architectural fragments, still testify to the interest of the Athenians in the festivals of the god of the vine. Closely adjacent, on a higher terrace, lay the sanctuaries of Æsculapius, Themis, Aphrodite, and Demeter, of which little except the foundations remain.

(3) In its most flourishing period, Athens contained upwards of 10,000 dwellings, and numbered at least 100,000 free inhabitants, and more than twice as many slaves. The number of citizens who were entitled to vote and to hold office was about 20,000. The decline of Athenian power and prosperity dates from the close of the Peloponnesian war (403 B.C.), which had exhausted the resources of Athens and broken her spirit. Still, even in this later time there were not wanting patriots and statesmen, such as Demosthenes and Lycurgus, who secured for Athens a new though brief ascendancy among the states of Greece, and made her the bulwark of Hellenic independence, until the fatal battle of Chæronea (338 B.C.), which established the Macedonian supremacy. Lycurgus, who stood for many years at the head of the financial administration of Athens, was most active in fortifying and building up the city. A new and magnificent arsenal in the Piræus, called after its architect the arsenal of Philon, was erected under his direction, and in Athens he built a new stage structure and lined the seats of the Dionysiac theatre with marble. On the banks of the Ilissus he laid out the Stadium, used for the first time in 330 B.C. for the games of the Panathenæic festival, it had seats for no less than 45,000 persons. He enlarged and beautified the gymnasium known as the Lyceum, where Aristotle expounded his science and philosophy. During the subsequent Macedonian occupation, Demetrius of Phalerum gave the city a wise administration. Now Athens became the seat of schools of philosophy and

rhetoric, and the metropolis of polite learning. The long list of benefactors of Athens during the Alexandrian period begins with Ptolemy Philadelphus (284 B.C.), who founded a gymnasium and library which bears his name. The kings of Pergamus, Attalus and Eumenes, built markets and halls and theatres, and the Syrian Antiochus Epiphanes (175 B.C.) resumed the building of the Olympieum, which for a long time had remained half completed. With the destruction of Corinth in 146 B.C. by the Romans, and the dissolution of the Achaean League (see ACHAIA), Athens with the rest of Greece became a Roman province. Yet for a long time the conqueror Rome sat at the feet of the conquered Athens, to learn her art and letters, and to gain from her sages teachings of philosophy and rules of statesmanship. Of the buildings of this period should be named especially the Tower of the Winds, which served as a kind of public clock and barometer, built by Andronicus Cyrrhestes, and the Gate of the Agora. The Emperor Hadrian probably no less through a desire to gratify his vanity than from a love of Greek culture, gave Athens a fresh revival of art and a new prosperity. An entire quarter of the city, south-east of the Acropolis, was named after him, as is attested by an inscription which can still be read on the 'Gate of Hadrian'. He finished the great Temple of Zeus begun by Pisistratus, which was thus more than 600 years in course of building. About the same time a wealthy Athenian, Herodes Atticus of Marathon, built, in honour of his wife Regilla, a magnificent theatre or odeum, the ruins of which rise conspicuously above all other remains of the ancient city at the foot of the Acropolis. But here is the turning point. From this time onwards the history of Athens is only one of spoliation and destruction, first by Romans, then by Goths, then by Christians, and last by Mussulmans. The Athenians had to pay dearly for espousing the cause of King Mithridates against the Romans. After a long siege, the Romans under Sulla took Athens and plundered it of many works of art. In 267 A.D. the city was captured by the Goths. In the next century Constantinople began to draw works of art from Athens for her adornment. The schools of philosophy, especially the Neoplatonic, still maintained their existence, and were the support of pagan religion. At last the Emperor Justinian, in 529 A.D., closed by edict the Athenian schools of philosophy, and the light of science and learning that had been shining for so many centuries, though but dimly at the last, was now wholly extinguished. The temples were converted into churches, whereby they suffered many architectural changes. In 1019 the Emperor Basilus II held in the Parthenon, now called Panagia, or the church of the Madonna, a religious celebration in gratitude for his victory over the northern barbarians. In 1204, after the conquest of Constantinople, Boniface de Montferrat became king of Greece. Athens was ruled by a succession of Frankish dukes until 1456, when the city fell into the hands of the Turks, under whose blighting despotism, with a brief interruption of Venetian ascendancy, it remained until the deliverance of Greece was effected in 1833 through the intervention of the great powers of Europe.

(4) With the liberation of Greece from the yoke of Turkey begins the history of Modern Athens. Before the transfer of the capital from Nauplia by King Otho, who had been chosen to the throne of the new kingdom, Athens was a wretched village of a few hundred houses. Since that time it has enjoyed a prosperous growth. Modern Athens has been built chiefly on the eastern and northern sides of the Acropolis, while the ancient city lay chiefly on the southern and western sides, and in its public

ATLANTIC OCEAN

buildings and newer parts it reminds one of the better-built German cities. It has a gymnasium on the German model, a girls' high school, excellent private schools, a polytechnic, and a university. Railways run to the Piræus and the Peloponnesus, and to Larissa, the last connecting with the general European system at Gida. A scheme for the extension, remodelling, and beautification of Athens was adopted in 1914. The chief business streets, 'Hermes' and 'Æolus,' cross at right angles, and divide the city into four nearly equal parts. Of modern public buildings the most noteworthy are the University; the Academy, which is built almost wholly of marble and shows with beautiful effect the polychromatic decorations of the ancient Doric style; the Exposition Hall; and the Palace, externally an ugly square building, but containing some spacious and handsome salons. Among recent erections are a magnificent national library, a theatre, and the new Stadium. All these, as well as the Academy and the Exposition Hall, are the gifts of wealthy Greeks, residing mostly abroad. Athens has many remains of antiquity in its three museums. At the eastern end of the Acropolis, the Archaeological Society of Athens has erected a low building in which are preserved the remains and fragments of ancient art exhumed on the Acropolis. The most noteworthy of these are several slabs of the Parthenon frieze, reliefs from the balustrade of the Temple of Wingless Victory, fragments of the frieze of the Erechtheum, and the archaic statues found near the Erechtheum. The museum contained in the Polytechnicum embraces the Mycenæ collection made by Dr Schliemann, figurines from Tanagra, Myrina, &c., and a rich collection of vases. The National Museum is especially rich in archaic statues and in sepulchral stelæ and reliefs. The Greek Archaeological Society affords every facility to foreign students, and carries on excavations. Of foreign archaeological schools at Athens, the French school was founded in 1846, the German Institute from 1873, and the Austrian from 1900. The American school, founded in 1882, is maintained by the co-operation of the leading colleges, and by the friends of classical studies in the United States. The British school was opened in 1886, and is under the patronage of the society for the promotion of Hellenic studies. Pop. (1907) 167,480; (1920) 300,701.

Athens, the name of more than twenty places in the United States, including a cotton manufacturing town in Georgia, 92 miles WNW. of Augusta, the seat of the university of Georgia (1801), with a population of 17,000; and a village in the south of Ohio, on the Hocking River, seat of the Ohio University and of the state lunatic asylum.

Atherine (*Atherina*), a small food-fish, the

type of a family, found in the Mediterranean, on the South of England, and in Irish waters. It is also called Sand Smelt, or even Smelt, though it is quite distinct from the last-named fish.

Atheroma. See ARTERIES.

Atherstone, a market-town of Warwickshire, 14 miles N. of Coventry by rail. Drayton, was born at Hartshill, close by.

Atherton, a mining and manufacturing urban district of Lancashire, part of Leigh parliamentary borough; pop. 20,000.

Athletic Sports. The ancient Egyptians indulged in singlestick and other sports, but the first organised games were the great Greek open meetings—the Olympian, Pythian, Nemean, and Isthmian games (see OLYMPIA, PYTHIAN GAMES, NEMEA, ISTHMUS, PANATHENÆA). Milo (q.v.) was the most noted professional; and Pindar (q.v.) celebrated victors in immortal odes. In 186 B.C. M. Fulvius introduced athletic sports at Rome, where they soon deteriorated into mere gladiatorial combats. Excluding hunting, hawking, and similar pursuits of the rich, the old sports of the English people were archery, bull and bear baiting, cock-fighting, running, jumping, throwing the bar, running at the quintain, tennis, broadsword, quarter-staff, bastard (blunted) sword, singlestick. 'Casting the bar' or the sledge-hammer was a favourite sport of that all-round athlete, Henry VIII. The Londoners have always been famous for their love of athletic sports. The Cotswold Games—famous in the 16th and 17th centuries—were founded by Robert Dover, attorney of Barton Heath, Warwick; they were held at Dover's Hill, near Honeybourne, and are described in *Annalia Dubrensa* (1636) and the *Cotswold Muse*. Judge Hughes's *Scouring of the White Horse* describes a similar meeting in Berks. The carnival at Halgaver Moor, Bodmin, was visited by Charles II. The Westmorland and Cumberland sports are closely akin to the ancient Highland games. The honour of holding the oldest athletic sports in the modern sense—in 1812—is claimed doubtfully by the Royal Military College at Sandhurst. The following are important dates in the history of amateur sport:

- 1837 Rugby School Crick Run founded.
- 1840-50. Occasional sports at chief public schools.
- 1852. 6th and 8th Dec.—Exeter College, Oxford, held the first sports at either university.
- 1853. Oct. 22—Cheltenham College held first 'modern' sports, with programmes, &c.—a regular festival.
- 1855. Oct.—First work on modern athletics, by 'Stonehenge.'
- 1857. Feb.—Trinity College, Dublin, first sports.
- " March 16, 17, and 18—Cambridge University Sports.
- 1860. Dec.—Oxford University Sports founded.
- 1861. Nov.—West London Rowing Club held first open amateur races.
- 1863. June—Mincing Lane Athletic Club formed.
- 1864. March 5—First Inter-Varsity Sports at Oxford.
- " April 21—First Civil Service Sports.
- 1866. Feb. 24—First sports held by London Athletic Club.
- 1866. Amateur Athletic Club formed.
- " March 29—Amateur athletic championships first held.
- 1867. Inter-Varsity Sports moved to London.
- " Irish Civil Service Sports, Dublin, first held.
- 1869. March 18—Lillie Bridge Grounds, London, opened.
- " Swimming Association of Great Britain founded.
- 1877. April 28—London Athletic Club ground opened.
- 1878. Bicycle Union founded.
- 1880. April 24—Amateur Athletic Association formed.
- 1883. June 14—Bicycle Union became National Cyclists' Union.
- 1884. Amateur Swimming Union formed.
- 1885. Amalgamated with Swimming Association of Great Britain, and became Amateur Swimming Association.
- 1887. Sept. 18—Riot at Lillie Bridge, thereafter closed.
- 1888. Queen's Grounds opened for Inter-Varsity Sports.
- 1895. Sept. 4—London A.C. sent a team to meet New York A.C. America beat England in all eleven events.
- 1896. April 6-18—Olympic Games, the Stadium, Athens.
- 1906. Athenian Celebration, Olympic Games.

From 1896 Olympic Games were held in every fourth year (except 1916) in different places (Paris, St Louis, London, Stockholm, Antwerp).

Chief Clubs and Grounds.—The London Athletic Club holds several meetings in the year at the

ground of the Chelsea Football Club, Stamford Bridge. It is the largest athletic club in the kingdom, with a first-rate cinder-track of four laps to the mile. The straight track of 200 yards, the only one of its kind in the country which was used exclusively by amateurs, was done away with when the ground was remodelled and taken possession of by the Chelsea Football Club. There is a very fine track at Heine Hill, leased by the London County Cycling and Athletic Club; but both the Catford and Putney tracks have been done away with. The former was built especially for speed-cycling, and was banked nearly 8 feet high at the bends, where it was 20 feet wide. The Wood Green track in north London has also been built over; but there is an excellent track at the Stadium, Shepherd's Bush, constructed for the Olympic Games of 1908, and another one at Queen's Club, West Kensington, where the Inter-Varsity athletic sports are held in the early spring. There is no faster track in the country than the one at Stamford, for it is slightly banked at the bends and there are two long straights which are dead-level. In the provinces, the finest cinder-track is that of the Manchester Athletic Club at Fallowfield; the championships of the Amateur Athletic Association have been decided there.

Chief Athletic Meetings.—Amateur sports had at first a hard struggle for existence, as general sport had then sunk to a very low ebb. They began with the various college sports. At Christchurch, Oxford, 14th March 1861, when the Prince of Wales was present, Lord Beaumont won the hurdles, Sir Frederick Johnson the long jump, with Hart Dyke second. The part taken by the Duke of Hamilton and other noblemen attracted attention to the new departure; then the Inter-Varsity meeting gave the new movement 'tone.' The first big athletic meeting was that in 1864 of the Civil Service Sports, still one of the best meetings of the year; but far and away the most important sports are the annual championships of the Amateur Athletic Association, held the first Saturday in July in London. Competitors are attracted from America, Australia, &c., as an English is practically the world's championship. Of closed meetings, the Inter-Varsity are the chief. In London, besides those already mentioned, the chief are the L.A.C., United Hospitals, Blackheath, South London, Finchley, and Polytechnic Harriers. The establishment of the Olympic Games has popularised athletics on the Continent, and the members of a Swedish team which visited Stamford Bridge for the championship meeting of the Amateur Athletic Association in the summer of 1913 (July 5) met with great success. Members of the team won five events—the mile (4 minutes 25½ seconds), throwing the hammer (155 feet 7½ inches), putting the weight (46 feet 2 inches), the half-mile (2 minutes ¾ seconds), and the pole jump (12 feet 1 inch).

Essex, Kent, and Hampshire take the lead in county championships, the best sports being annually held at Southend-on-Sea. Of late sports have advanced at a bound in the Channel Islands (September). In Ireland, Dublin University draws the largest and most fashionable 'gates.' The Queen's Colleges at Cork, Galway, and Belfast also promote important sports; and the North of Ireland Cricket Club Sports (established 1870) draw a noted gathering. Irishmen excel in shot-putting, hammer-throwing, and jumping. In Scotland there are, as in Ireland, annual championships.

Except cycling, no branch of sport has so rapidly expanded as cross-country running, formerly known as 'paper-chasing,' or hare and hounds. The Thames Hare and Hounds held the first open race, the 'cross country,' on 7th December 1867, at Wimbledon. The National C.C. Championship

(1877) is held alternately in North, South, and Midlands. Each club enters twenty, and runs not more than twelve, men. The positions of the first six are added together, and the club with the lowest score wins. There are generally over 300 runners, and the distance is about 10 miles of pretty stiff 'hunting country.' In 1892 the Southern Junior was run partly over Epsom Racecourse, and there were over 300 runners. Cambridge and Oxford have now an annual meeting. Among the chief London 'harriers' are the Ranelagh, Highgate, Heine Hill, Finchley, Polytechnic, Blackheath, South London, Essex Beagles, &c. The London clubs usually meet on Saturdays for a run. They either (1) make the best of their way throughout, or (2) appoint a 'pace-maker' to regulate the speed of the hounds, so as to give the slower runners a chance, or (3), after the hares have had their 'law,' start the 'slow pack' first, and the fast pack afterwards. In the cross-country races for prizes the trail is carefully laid beforehand, and the runners are handicapped by time starts. Sometimes all the competitors are started together, each being allowed so many minutes and seconds, which are deducted from his time for the whole distance, and he whose time comes out the shortest is declared the winner. This is called a 'yacht race' if the starts are declared beforehand; if not made public till afterwards, it is a 'sealed handicap.' Rugby was the cradle of paper-chasing. Early in the century the fags carried the paper, while the preceptors, armed with horse-whips, were the huntsmen, and some even hired horses to follow the line. The famous Rugby 'Crick Run' (1837) is the oldest regular athletic event in the world.

In comparing modern records with those of about 1865, it must be remembered that amateur sport was then in its infancy; an athlete had few opportunities for showing his skill, whereas now he has a confusing choice. There were few tracks, and training was but little understood. Even allowing for this, there has been a tremendous improvement, and how closely the best amateurs now approach the professionals is shown by a comparison of the tables given in almanacs. While there is no short-distance runner of the calibre of either Hutches, of the old school, or Donaldson, representing present-day pedestrianism, there is little doubt that middle and long distance men in the amateur ranks are superior to those recognised as professionals. There are now no inducements for men to train for money matches or stakes, though the promotion of a long-distance race for professionals in connection with the Powderhall festival in Edinburgh, and at the sports run in the summer under the management of the *Sporting Chronicle* (Manchester), have brought out fine long-distance runners. The walkers, however, now have little or no support, and a race for the professional short-distance championship in London in the spring of 1913 did not attract a hundred spectators, though Fenton (an ex-amateur champion) and Cummings, the contestants, were known to be capable of accomplishing a splendid performance.

There are separate articles on the following subjects connected with sports and pastimes:

Athlone, a town on both sides of the Shannon, chiefly in Westmeath, 80 miles W. of Dublin by rail. The Shannon is crossed by a fine bowstring and lattice iron bridge of two arches, 175 and 40

feet span. Till 1885 Athlone returned one member to parliament. Athlone Castle, founded in the reign of King John, was one of the chief military positions in Ireland. In the war of 1688 it was unsuccessfully besieged by William III. in person, but was afterwards taken by General Ginkell. The fortifications cover 15 acres, and contain barracks for 1500 men. Pop. 7500.

Athol, a district in the north of Perthshire, occupying a great part of the southern slopes of the Grampians, and giving the title of Duke of Atholl to a branch of the Munay family. See BLAIR-ATHOL.

Athos (Gr. *Hagion Oros*, It. *Monte Santo*, 'Holy Hill'), the most eastern of the three tongues of the Chalcidice Peninsula on the Aegean Sea, connected with the mainland by a low and narrow isthmus, about a mile across. The length of the peninsula is about 31 miles; its breadth varies from 3 to 6 miles. At the southern extremity, a solitary peak rises abruptly to a height of 6346 feet above the sea. In ancient times, several towns were built on the peninsula, five being mentioned by Herodotus. The Persian king Xerxes cut a canal through the isthmus, to escape the stormy gales which rendered the navigation round the promontory very perilous, and which had shattered the fleet of Maedonius some years before. Traces of this canal still exist. This peninsula is celebrated as the seat of a kind of monastic republic (subject to Greece since 1912), consisting of twenty large monasteries (seventeen Greek, one Russian, one Bulgarian, one Serbian), besides some Rumanian monks, numerous hermitages and small houses. The whole community is governed by four presidents, one styled 'First Man of Athos,' and a Holy Synod, consisting of one representative from each monastery. Under the Turks they enjoyed complete autonomy, subject to paying an annual tribute of £3500. The monks follow the rule of St Basil, supplemented by the tipikon of each house. They are employed in agriculture, gardening, bee-keeping, and the manufacture of amulets, religious objects, &c., while they also reap profits from the numerous visits of pilgrims. The brethren in the idiorhythmoi (republican monasteries) have been compared to fellows of a college. They are interested in worldly affairs, own private property, and may eat meat if they cook it themselves. Kayes, the principal place in the peninsula, is picturesquely situated in the midst of vineyards and gardens. Here the market is held. No female, even of the lower animals, is permitted to enter the peninsula. In the middle ages, Athos was the centre of Greek learning and Christian-Byzantine art; now learning is at a low ebb, and the libraries have been sadly neglected. In the 20th century the 'heresy of the name of God' (that the name of God is itself God) gained many adherents in Athos, and over 800 heretical monks were deported by Russian soldiers to Odessa in 1913.

See Hasluck, *Athos and its Monasteries* (1924).

Athy, the chief town of County Kildare, Ireland, on the river Barrow, here joined by the Grand Canal, 45 miles SW. of Dublin by rail. It has a large grain-market. Pop. 3500.

Atitlán, a Central American lake, in the department of Solola, in Guatemala, 24 miles in length, and 5 to 10 miles in breadth. It seems to occupy the crater of an extinct volcano, and has a depth of over 1000 feet; and it has no visible outlet, though several small streams run into it. High cliffs, almost bare of vegetation, surround the lake, and on its southern bank rises the volcano of Atitlán (10,538 feet), at whose foot lies the little Indian town of Santiago de Atitlán.

Atlanta, called the 'Gate City,' is the capital of Georgia, the largest city in the state, and the seat of justice of Fulton county. An eminently prosperous place, it is situated 1100 feet above sea-level, on an elevated ridge dividing the waters of the Chattahoochee River from the rivers that flow into the Atlantic, 294 miles NW. of Savannah. It has a remarkably healthy and equable climate, the mean annual temperature being about 60° F. It is 7 miles SE. of the Chattahoochee River. Seven railroads centre at Atlanta, the most of which are trunk-lines with numerous connections. Atlanta has an extensive and rapidly increasing trade in cotton, dry goods, horses and mules, grain, and tobacco. Its industries include flour and cotton mills, the manufacture of machinery, agricultural implements, street cars, cotton-seed oil, and fertilisers.

The chief public buildings are the state capitol, court-house, custom-house, city hall, chamber of commerce, and opera-house. There are primary, grammar, and high schools for white and coloured persons. Other institutions are a branch of the state university (at Athens), a technical school, a Baptist college, the Atlanta University for the education of coloured young men and women, Clark Theological School (coloured Methodist), and two medical colleges. The city limits comprise a perfect circle, with a diameter of 3 miles, and with its centre at the Union Passenger Depot. In the civil war, the city was captured by the Union troops under General Sherman (September 2, 1864), and the entire business portion was destroyed by them on leaving it about a month later. Since the restoration of peace, however, its prosperity has been uninterrupted and its growth rapid. Atlanta was settled in 1840; was incorporated as the village of Marthasville in 1842; as Atlanta, in 1847. Pop. (1850) 2572; (1860) 9554; (1870) 21,879; (1880) 37,409; (1900) 89,872; (1910) 154,839; (1920) 200,616.

Atlantes, in Architecture, so called by the Greeks in reference to the mythical Atlas (q.v.), are male figures used instead of columns. The Romans called them Telamones. Female figures employed in this way are called Caryatides (q.v.).

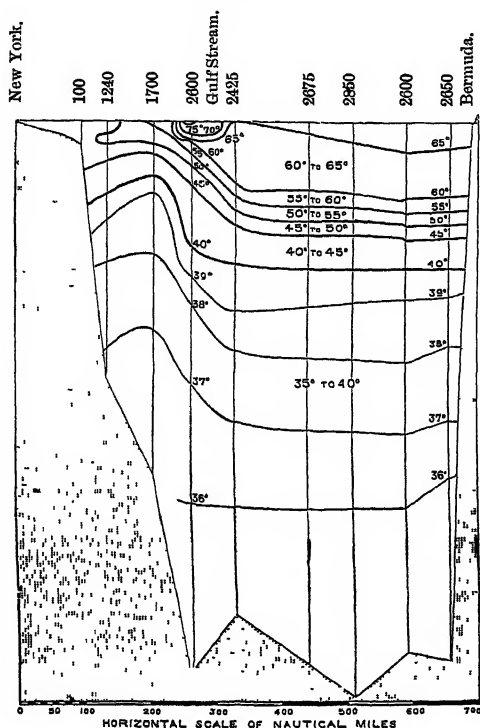

Atlantic City, a fashionable American health-resort, is situated on a narrow, sandy island off the coast of New Jersey, 60 miles SE. of Philadelphia by rail. A good beach attracts large numbers of summer visitors. Incorporated in 1854, the place grew rapidly; its wide avenues are lined with handsome cottages and villas. In 1903 the city suffered a loss of \$1,000,000 through a disastrous fire. Pop. (1870) 1043; (1890) 13,055; (1920) 50,707.

Atlantic Ocean, so called either from Mount Atlas or from the fabulous island of Atlantis, separating the Old from the New World, Europe and Africa being on the E., and North and South America on the W. Its greatest width is about 5000 miles, but between Brazil and the African coast the distance is only about 1600 miles. It is in open communication with both the Arctic Ocean and the Antarctic through the Southern Ocean. The North Atlantic, from the Norwegian Sea to the

Atlas Column.

equator, has an area of 14,300,000 sq. m. It communicates with many inclosed or partially inclosed seas, such as the Caribbean Sea, Gulf of Mexico,

Section of the North Atlantic Ocean, across the Gulf Stream, between New York and Bermuda:

Showing the Soundings (in fathoms) and Isothermal Lines obtained in H.M.S. *Challenger*. The vertical scale, as compared with the horizontal, is as 400 to 1; so that the inclines are 400 times less steep than represented. It was necessary to adopt this exaggerated scale in order to show the relative position of the Isothermal Lines.

and Hudson Bay on the west, the Baltic, North Sea, Mediterranean, and Black Sea on the east, whose combined areas are about 3,700,000 sq. m. The South Atlantic from the equator to 40° S. has an area of over 10,300,000 sq. m.; if it be supposed to extend through the Great Southern Ocean as far as the Antarctic circle, its area is nearly 17,000,000 sq. m. Including the Arctic Ocean and the other seas with which it is in open communication, the Atlantic has a drainage area of over 26,500,000 sq. m. On this land, draining directly or indirectly into the Atlantic, Sir John Murray estimates there is a rainfall of 15,800 cubic miles annually, and that the annual discharge of rivers into the Atlantic is 3400 cubic miles of water, equal to about one-half the rainfall and river discharge of the world.

Towards the centre of the North Atlantic, between Africa and North America, and in the centre of the South Atlantic, between Africa and South America, there are anticyclonic areas of high atmospheric pressure (over 30 inches), out of which winds blow in all directions to surrounding regions where the pressure is less. For instance, to the westward of North Africa, the prevailing winds are northerly and north-westerly; on the south side of the anticyclonic region they are easterly; and on the west, off the North American coast, they are southerly. A similar system of winds prevails in the South Atlantic. The positions of these high-pressure areas, and the winds that blow out from them, determine

the great oceanic currents and the positions of the Sargasso seas, for the winds everywhere determine and control the movements of the surface waters. The SE. and NE. trades drive the heated surface waters of the tropics before them, and eventually produce the *Equatorial currents*. On reaching Cape St Roque the southern current bifurcates, one branch becoming the *Brazil current* of the South Atlantic, the larger branch passing on to the Caribbean Sea and Gulf of Mexico, finally issuing from the latter by the Strait of Florida, forming the *Gulf Stream*, the greatest and most important of all oceanic currents. The Gulf Stream spreads out over the Atlantic to the south of Newfoundland; one prolongation of it returns to the tropics off the coasts of Spain and Africa; the other passes north between the British Isles and Iceland, and on to the coasts of Norway. A cold Arctic current passes southward along the shores of Greenland, and unites off Cape Farewell with the Davis Strait current, forming the *Labrador current*, which proceeds along the east coast of America, and passes beneath the Gulf Stream to the south of the banks of Newfoundland. Icebergs are carried as far south as 40° N. in the northern and as far north as 38° S. in the southern hemisphere. In the equatorial regions the surface water has generally a temperature ranging from 70° to 84° F.; the temperature decreases as the depth increases, the coldest water being found at the bottom, though a slightly higher temperature is said to have been recorded just above the bottom. The warm water is a relatively thin stratum, the greater part of ocean water having a temperature below 40° F. It is ice-cold in the Atlantic at the bottom even beneath the equator; the ooze dredged from the bottom beneath a tropical sun is so cold that the hand cannot be placed in it without great discomfort. The low temperature of deep ocean water is acquired in the polar regions chiefly in the high latitudes of the southern hemisphere.

The warm salt water carried into the North Atlantic by the Gulf Stream slowly sinks on account of the reduction of temperature on reaching higher latitudes, and carries heat down with it, consequently relatively warm water is found at a greater depth in the North Atlantic than in any other ocean. A temperature of 45° is found off the north of Scotland at a depth of 600 fathoms (three-fourths of a mile), while off the west coast of Africa a similar temperature is met with at only 200 fathoms beneath the surface. The temperature of the ocean is lower off the leeward shores of continents than on the weather shores, as the cold deep water is drawn up to the surface to supply the place of that driven before the winds: this is probably the reason why coral reefs are absent in the eastern parts of the ocean in the tropics, while they flourish in the western. The water of the Atlantic is freshest—that is, contains the least salt—towards the poles and in the equatorial belt of calms. The saltiest water (density over 1.0275) is found in the centre of the trade-wind regions. This is not, however, so salt as the Mediterranean and Red Sea (over 1.0280). The salinity of the deeper waters is considerably below the average of the surface. The average depth of the Atlantic is between 2 and 3 miles (2200 fathoms). A low submarine ridge runs down the centre, from north to south, with an average depth of about 1700 fathoms over it. On either side of this ridge there are, both in the North and South Atlantic, depths of between 3000 and 4000 fathoms. The greatest depth is in the Nares Deep north of the Virgin Islands, where a sounding of 4662 fathoms has been obtained. The deposits towards the central portions of the Atlantic are chiefly made up of the dead calcareous shells of

organisms which have fallen from the surface. On the central elevation, where the depths are less than 1500 fathoms, the deposits are largely made up of the shells of pelagic Molluscs, and the deposits are called *Pteropod ooze*; from 1500 to 3000 fathoms, the shells of pelagic Foraminifera prevail, and the deposits are named *Globigerina ooze*. In depths greater than 3000 fathoms there is a reddish clay, chiefly made up of disintegrated pumice and other volcanic material. Near the shores there is a mixture of land debris and surface organisms, and the deposits are red and blue muds, green glauconitic muds and sands, coral and volcanic muds and sands. The surface waters from equator to poles swarm with all kinds of pelagic plants and animals, many of which emit phosphorescent light, producing what is known as luminosity of the sea. In the centre of the North Atlantic, in the so-called Sargasso Sea, there are enormous floating banks of gulf weed (*Sargassum bacciferum*), on which large numbers of peculiar animals live. Life has been found to exist at all depths in the Atlantic, but it becomes less abundant as greater depths and a greater distance from continental shores are reached. There are relatively few oceanic islands. Iceland, the Azores, St Paul's Rocks, Ascension, and the Tristan da Cunha group all rise from the central elevation, and are all of volcanic origin. Jan Mayen rises from the deep water of the Norwegian Sea. The coral group of Bermudas rises from the deep water of the Western North Atlantic. Off the west coast of Africa are the Canaries, Cape Verdes, and Madeira. In the South Atlantic, to the west of the central ridge, are Fernando Noronha and Trinidad, and to the east of the central ridge, St Helena. There are numerous continental islands, such as the British Isles, Newfoundland, the West Indies, the Falklands, and others. The most civilised nations of the world inhabit the shores of the Atlantic, and it is the great commercial highway of the world. Its coasts are better surveyed, better lighted, and its winds and currents better known than those of any other ocean. It has been sounded in all directions. In the neighbourhood of some continental shores, and around some of the volcanic cones which rise from the floor of the ocean, there are occasionally very steep slopes; but as a rule the bed of the ocean is a widespread, gently undulating plain.

Atlantis, a vast mythical island in the Atlantic mentioned by Plato, of which an Egyptian priest had told Solon. An earthquake is said to have engulfed it nine thousand years before his time, at the close of a long contest with the Athenians. Plato says that shoals of sand marked the site. The Gardens of the Hesperides and the Islands of the Blessed were referred to the same region. The Celts had wonderful tales of a land of the dead in the west, Glasinnis or Avalon (q.v.), whence perhaps the phrase 'to go west.' Stories about an Antilia (see ANTILLES), Brasilia, and the St Brendan (q.v.) legend reflect similar beliefs. Palaeontological evidence shows that land actually existed in the west in Tertiary times; but of this there could be no tradition. It has been suggested that the Atlantis of the Egyptians was Crete (which was west for them), and that the Greeks transferred it farther west.

Atlantosaurus, one of the largest dinosaurs of which remains have been preserved, also called Titanosaurus. The femur is 6 feet 2 inches long. The size of the bone indicates a length for the animal of at least 60 feet, and a height of 30 feet or thereabout. The remains were obtained in the Jurassic strata of Colorado. See DINOSAURIA, DIPLODOCUS.

Atlas, in Greek Mythology, son of the Titan Iapetus and Clymene, and brother of Prometheus

and Epimetheus. He was father of the Pleiades and the Hyades. As leader of the Titans, he attempted to storm the heavens, and for this supreme treason was condemned by Zeus to bear the vault of heaven on his head and hands, in the neighbourhood of the Hesperides at the western extremity of the earth, where day and night meet, on the mountains in the north-west of Africa still called by his name. Some supposed, however, that he was originally a man metamorphosed into a mountain; and Ovid explains that Perseus changed him by means of Medusa's head into stone for his inhospitality. Some tried to rationalise the myth, explaining Atlas as a mighty king who had great skill in astronomy, and only tried to storm heaven intellectually.

Mercator, in the 16th century, gave the name *Atlas* to a collection of maps, probably because the figure of Atlas had been on the title-pages. See MAP.

Atlas, the great mountain-system of North-western Africa, stretching from Cape Nun in Morocco to Cape Bon in Tunis, a distance of about 1400 miles. It is not a chain, but a very irregular mass of many chains running in various directions, meeting in mountain-knots, or connected by short chains of inferior height, and diversified still further by several solitary mountains and groups of mountains. The general direction is from south-west to north-east. Some limit the Atlas proper to Morocco. At any rate the principal chain, *Jebel Aiaschin*, is entirely within Morocco, forming a three-sided watershed to the Mediterranean, the Atlantic, and the Sahara. The Atlas attains its greatest height (estimated at 14,500 feet) in Ouen Krim—about 60 miles SSW. of the city of Morocco—Jebel Ifni, and Tizi n' Tagharat. The most southern chain diverging from the central mass bears the name *Jebel-Hadnar*. The heights approach the sea, and form the promontories jutting out into the Atlantic. From Morocco, the Atlas gradually decreases in height towards the east. In Algeria the elevation is only 7673 feet; in Tunis, 4476 feet; and in Tripoli, 3200. The slopes on the north, west, and south are covered with vast forests of pine, oak, cork, white poplar, and wild olive. Except on the southern slopes, there are many well-watered, fertile valleys, carefully tilled and irrigated. On some of the summits snow lies for a great part of the year. The iron and copper ores have proved a bait to Spanish, French, and German ambitions; salt and fine marbles abound; lead and antimony are also found.

Atlas is that piece of the human vertebral column which articulates with the Skull (q.v.); in other words, the first cervical vertebra. It may be distinguished from the other six by its being without a body and spinous process, by its being a mere irregular bony ring, divided into two unequal parts by a constriction; this division in the recent subject is completed by a ligament, the segment in front being occupied by the tooth-like process of the second cervical vertebra or axis, and that behind by the spinal cord and its coverings. On either side the ring is very thick; each lateral mass is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra. The atlas, with the occipital bone, forms the joint on which the head moves in nodding; and turns on the pivot of the second cervical vertebra, when we look from side to side. See SPINAL COLUMN.

Atlas, a kind of silk-satin manufactured in the East. The word is Arabic, and means 'smooth,' 'bare;' hence it has been applied to smooth silk cloth.

Atmolysis, a method of separating a mixture of gases by taking advantage of their different rates of passage through a porous septum. See DIFFUSION, GASES.

Atmometer, an instrument which can be used to determine the humidity of the atmosphere. Its action has not yet been fully investigated. It consists of a hollow ball of unglazed clay with a glass stem. The whole is filled with water and inverted in a dish of mercury. As the water, having passed into the pores, evaporates from the surface of the ball, the mercury rises in the stem. If much water-vapour be present in the atmosphere, condensation takes place in the pores, and the mercury falls in the tube.

Atmosphere (Gr. *atmos*, 'vapour,' *sphaira*, 'sphere') is the name applied to the gaseous envelope which surrounds the earth. The existence of an atmosphere is to us a matter of vital importance. We owe to its influence the possibility of animal and vegetable life, the modifying and retaining of solar heat, the transmission of sound, the gradual shading of day into night, the disintegration of rocks, and the occurrence of weather phenomena. In consequence of the action of gravity, the atmosphere assumes the form of a spheroidal stratum concentric with the earth, and presses heavily on its surface. It exhibits, in common with all fluid bodies, the usual characteristics of hydrostatic pressure, but its internal condition differs from that of a liquid inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water; hence, the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

That air possesses *weight*, is illustrated by the following simple experiment. If a hollow glass globe of 5 or 6 inches in diameter be weighed first when filled with air, and then after the air has been extracted from it by means of the air-pump, it will, when thus exhausted, weigh sensibly less than it did before, and the difference of the two results will represent the weight of the quantity of air which has been withdrawn. It has been determined by Biot and Arago that 100 cubic inches of dry air, when the barometer is at 30 inches, and the thermometer at 60° F., weigh 31·074 grains. The law of Archimedes (see ARCHIMEDES, PRINCIPLE OF), that a body immersed in a fluid loses a part of its weight equal to the weight of the volume of fluid displaced by it, finds its application in air as well as in water. If a glass globe filled with air and closed be suspended at the extremity of the beam of a delicate balance, and be kept in equilibrium by a brass weight at the other extremity, and if the whole be then placed under the receiver of an air-pump, and the air extracted, the equilibrium previously existing in air will be disturbed, and the larger body will become the heavier. The reason of this is, that when first weighed, they each lose as much of their own weight as that of the respective volumes of air displaced by them, and are therefore made buoyant, though in different degrees, the ball with the larger volume having the greater buoyancy. In a vacuum, they are deprived of this buoyancy, and the larger body, suffering the greater loss, becomes sensibly heavier than the other. In like manner, a balloon filled with heated air or hydrogen gas is lighter than the volume of air displaced by it. It is therefore forced upwards till it reaches a stratum

of such density that the weight of the volume of air there displaced by it equals the weight of the balloon itself. In this stratum it will remain poised, or move horizontally with the currents to which it may be exposed.

In endeavouring to determine the *form* of the atmospheric envelope, it is necessary to bear in mind that, according to the law of fluid-pressure, in order to produce a state of equilibrium at the level of the sea, the pressure of the atmosphere must be equal at that level over the whole of the earth's surface. Gravity acts with less force on the air at the equator than on that at the poles, in consequence of the spheroidal form of the earth. It has there, in addition, to contend with the centrifugal force, which entirely falls at the poles, and which has a tendency to lighten the air by acting contrary to that of gravity. Hence we infer that, in order to produce the same pressure at the level of the sea, the atmospheric height at the equator must be greater than that at the poles, and that the atmosphere must therefore possess the form of an oblate spheroid, whose oblateness is considerably greater than that of the earth itself. The greater heat at the tropical regions must also have the effect of increasing the oblateness.

The *height* of the atmosphere has not yet been determined. That it must have a certain limit, is evident from the consideration that there must be a point at which gravity on the one hand, and centrifugal force and the repulsive action of the particles on the other, are poised; and beyond this point, the latter forces outbalancing the former force, the aerial particles would be borne away from the earth. As, however, the law of the diminution of temperature, which materially affects the repulsive action, is unknown for the upper regions of the air, it is impossible to calculate the height of the atmosphere from the relations of these forces. From the observation of luminous meteors, however, it is inferred that in an extremely attenuated form it even reaches 500 miles.

The *pressure* of the atmosphere is one of its most important properties. Its effect is exhibited in the action of the ordinary water-pump. The piston is fitted air-tight in its cylinder; and on being drawn up, creates a vacuum. The water within the pump being thus freed from pressure, while that outside of it is exposed to the pressure of a column of air reaching to the surface of the atmosphere, is at once forced up by reason of the weight of air which it must rise to balance. The ascent of the water takes place till the piston has reached the height of nearly 34 feet, from which we conclude that a column of air is equal in weight to a column of water of the same horizontal section, and of the height of nearly 34 feet. As mercury is 13·6 times heavier than water, a mercurial column freed from atmospheric pressure at the one extremity, and subjected to it at the other, is 13·6 times less in height than the column of water, or about 30 inches. From the more convenient size of this column, mercury has been adopted as the standard for atmospheric pressure, and is employed in our ordinary Barometers (q.v.). A mercurial column of 30 inches in height, and 1 square inch in section, weighs 15 lb. (more accurately, 14·73), which gives us the equivalent weight of a column of atmospheric air of the same section. The word *atmosphere* is often employed to express this weight or pressure on a square inch of surface, so that when we speak, in Mechanics, of the pressure of steam on a boiler as amounting to three atmospheres, we mean a pressure of 45 lb. on the square inch. The pressure on a square inch being thus ascertained, we have merely to multiply it by the number of square inches on the earth's surface to obtain the total pressure or weight of the atmo-

sphere. It amounts to 11·67085 trillions of lbs., or about $\frac{1}{1000000}$ of the earth's mass. It must be observed that the height of the barometric column is not a constant quantity, as it varies irregularly from time to time, and more or less regularly with the latitude, the region, the season of the year, and the hour of the day. The pressure of the atmosphere in the northern hemisphere increases as we recede from the equator, reaching a maximum at 30° N. lat., and generally decreasing from 30° to 65°, where it again begins to rise. The greater height, about 30°, is restricted to the oceans immediately to the westward of continents. As the heat of the earth's surface increases the rarity of the air above it, and causes the air at the top of the heated column to overflow, the barometer stands at a minimum in summer and a maximum in winter, and this obtains over the continents or land surfaces of the globe. But over the oceans of the higher latitudes pressure falls to the annual minimum in winter, and rises to the maximum in the early summer. The variations of atmospheric temperature which occur, with their effects, result in a regular diurnal variation of the pressure of the atmosphere. There are two maxima—one about 10 A.M., the other 10 P.M.; and two minima—at 4 A.M. and 4 P.M.

The temperature of the atmosphere as shown from automatic instruments attached to unmanned balloons falls in general to a height of 6 miles, at the rate of about 1° F. for each rise of 300 feet. Above this level the temperature remains practically constant, no further decrease taking place. The name *stratosphere* has been given to this upper region, the lower surface of which in the British Isles varies roughly between 5 and 7 miles. The height at which the stratosphere is entered is highest over the equator and lowest in polar regions. Temperature does not continue to fall in the stratosphere, because of equality in that region between emitted and absorbed radiation. In an ascent from Batavia on 4th December 1913 a temperature of -133° F., or 165° below freezing-point, was registered at a height of 10·6 miles, being the lowest temperature ever recorded naturally.

Till 1894 it was assumed that the chemical composition of the atmosphere had been definitely ascertained, and that 100 volumes of dry air might be taken, on the average, as consisting of 79·02 volumes of nitrogen, 20·94 of oxygen, and 0·04 of carbonic acid; with other gaseous matters, but in quantities so small as not sensibly to increase the bulk of the atmosphere, such as ammonia and ammoniacal salts, carburetted and sulphuretted hydrogen, carbonic oxide, sulphurous and sulphuric acid, nitric acid, and perhaps iodine, the quantity and even the presence of which are affected by local and meteorological causes. But the discovery of argon in 1894, announced in 1895, and the associated discovery of helium (both described at ARGON), startled the world and prepared the way for the intimation that three other gases, to be called neon, krypton, and xenon, were also to be detected in our atmosphere. Still, dry air may be said to consist of 4 volumes of nitrogen and 1 of oxygen, with an admixture of argon and carbonic acid, and a mere trace of several other substances. As, however, the air of the atmosphere is never found dry, we must add to the constituents already named watery vapour, the amount of which is constantly changing, according to locality, weather, wind, and temperature. It is stated that of 1000 grains of atmospheric air, the proportion due to aqueous vapour varies from a minimum of 4 to a maximum of 16 grains. By far the most active chemical constituent of the atmosphere is oxygen, to the agency of which are owing the existence of animal life, the maintenance of combustion, the rusting of

metals, and the occurrence of several other chemical phenomena too numerous to be detailed. A small portion of this oxygen occurs in the form of Ozone (q.v.), a modification which, according to recent chemical discoveries, plays an important part in the chemistry of the atmosphere. The nitrogen which forms the bulk of the atmosphere possesses few chemical properties of importance, but performs the important part of diluting the oxygen, which, if it occurred alone, would act with too great intensity. The presence of carbonic acid in the air is shown by the production of the white carbonate of lime in lime-water freely exposed to its influence. Carbonic acid is produced in all processes where carbonaceous matter unites itself with the oxygen of the air, such as in animal respiration, in combustion, in fermentation, in putrefaction, and similar processes. The green leaves of plants, on the other hand, possess, in presence of sunshine, the power of decomposing carbonic acid into its elements, absorbing the carbon for their own tissues, and restoring the oxygen to the atmosphere in its original purity. Between the processes above mentioned, on the one hand, and the action of plants on the other, the quantity of carbonic acid in the air is kept nearly constant. From the table it will be seen that 10,000 volumes of atmospheric air contain 4 volumes of carbonic acid. If it occurred in a much larger proportion, being poisonous, it would become dangerous to animal life; and if it occurred in a much less proportion, the vegetable world would lack its requisite nourishment. The other substances, of which a trace is always or only sometimes found in atmospheric air, are difficult to detect in the air itself, but are generally found dissolved in rain-water, more especially in that which has fallen immediately after a long drought. Of these, by far the most important and widely diffused are ammonia and ammoniacal salts, which are of essential importance to the vegetable economy, because, dissolved in the rain, they furnish plants with the nitrogen required by them for the production of their flowers and fruit. Nitric acid is detected in the air after thunderstorms, sulphuretted hydrogen in the tainted air of sewers and such-like places, and sulphurous and sulphuric acid only in the neighbourhood of chemical or smelting works. A considerable quantity of carbonic oxide and carburetted hydrogen escapes unconsumed from our furnaces; and although the latter gas is in addition given off to the air in marshy and bituminous districts, the two occur in almost inappreciable quantity in the atmosphere.

In addition to its gaseous constituents, the atmosphere contains solid substances in a state of exceedingly fine division, the presence of which is revealed in the sunbeam. Many of these minute particles, being the seeds or germs of plants and animals, must exert an important influence on the organic substances on which they may finally settle, inducing in many of them the conditions of disease or putrefaction. The results of the Krakatau eruption of August 1883, and deep-sea dredgings in the Pacific, reveal that a large amount of meteoric and volcanic dust is suspended in the atmosphere; and Aitken showed fine dust particles to be essential as nuclei in the formation of fog and cloud. In 1892-93 Dewar succeeded in liquefying atmospheric air. See DUST, ETHER, FOG, GAS AND GASES, GERM, HYDROSTATICS, LIGHT, REFRACTION, SOUND, WAVE.

When the composite nature of the atmosphere was first discovered, it was supposed to be a chemical combination of nitrogen and oxygen, but further inquiries have rendered this opinion highly improbable. When any two bodies unite with each other chemically, the substance which results from

their combination invariably possesses properties which the original constituents did not possess. Now the atmospheric union of oxygen and nitrogen is distinguished by no properties which may not be attributed individually to these gases. We have, then, in this respect, no indication that the atmospheric combination of oxygen and nitrogen is a chemical one. Again, when any composite gas is dissolved in water, the proportion of the ingredients dissolved in it is exactly the same as that in which they occur in the compound itself; but this is not the case with air dissolved in water, which is found to be richer in oxygen than atmospheric air. Now, as oxygen dissolves more readily in water than nitrogen, it is manifest that this larger proportion of oxygen arises from both gases acting independently of each other in respect to the water, a condition that would be impossible if they were in chemical union. From these and other corroborative facts, the atmosphere is considered to be simply a mechanical combination of the gases contained in it. This, however, does not prevent the atmosphere from having a uniform composition, as might at first sight be supposed; for when gases are mixed with each other, they may practically be regarded as intermingling thoroughly throughout the whole space occupied by them. Local causes may temporarily affect the relative proportion of the ingredients, but the changes are minute.

Sloane, *Liquid Air* (1899); Sir W. Ramsay, *The Gases of the Air: the History of their Discovery* (1896); W. H. Dines, *The Characteristics of the Free Atmosphere* (1919). See also ELECTRICITY (ATMOSPHERIC), METEOROLOGY, RADIUM, for atmospheric engine, see AIR-ENGINE.

Atna, or **COPPER RIVER**, a river in South Alaska which rises between 62° and 63° N., and flows west of the Wrangell Mountains into the Gulf of Alaska, between Prince William Sound and Controller Bay. Glaciers and rapids mark its course. As its name indicates, copper is found in the valley. In 1911 the Copper River and North-western Railway was completed from the port of Cordova to Kennecott, about 200 miles inland.

Atoc, or **ATOK**, a Central and S. American skunk.

Atoka, a small town in the Choctaw portion of Oklahoma.

Atokos, a small Greek island in the Ionian group, north-east of Ithaca.

Atoll, a form of coral island, consisting of a more or less interrupted ring of coral rock, enclosing a central lagoon. The word *atollon* is used by the natives to denote the Maldive Islands, typical specimens of this formation (according to conjecture from Malayalam *adal*, 'closing'). As examples may be mentioned Whitsunday Island, Keeling Atoll, Bow Atoll, Peros Banhos Atoll. See CORAL, POLYNESIA.

Atolla, a widely distributed genus of deep-sea jelly-fishes. The marginal lobes are numerous, their number being indefinite. The number of tentacles is also irregular. The diameter of the umbella may reach 150 millimetres.

Atom. Matter is composed of atoms in the same sense as a house is built of bricks. The superficial appearance of continuity presented by any material substance, say water or iron, is deceptive. Ultimate continuity is probable, by reason of ether—the ether of space—but ordinary gravitative matter is atomic and discontinuous, as further explained under head MOLECULE. In modern use the term 'atom' is employed to designate the smallest portion of any element which can enter into chemical combination or otherwise take part in physical and chemical processes and

yet preserve its identity. The atom of matter is not now supposed to be unchangeable or indivisible, because some of them—atoms of uranium, for instance—are known spontaneously to throw off fragments of themselves from time to time, thereby losing weight and passing into some other form of matter—one of which forms is on good evidence believed to be radium, while at a further stage in the process of subdivision or disintegration the residue is suspected of being the common metal lead. If the term degradation is applied to this process of spontaneous explosion and gradual disintegration, the term is to be understood in its strict sense as a passing down the scale of atomic weights, not in any sense of disparagement.

The small fragments of the original atom thrown off in the process of degradation are in many cases, perhaps in all, atoms of helium—a gas at first known only spectroscopically in the sun, and appropriately named by Sir Norman Lockyer, but subsequently discovered and isolated on the earth by Sir W. Ramsay as one of the great Argon group of inert monatomic chemical elements. Thus a heavy atom, though an atom of what has long been and may still be called an Element (q.v.), may be regarded as compounded or built up of a great number of constituents which can be thrown off with considerable energy, and thereafter lead an independent existence as sub-atoms or atoms of elements lower in the scale.

If, then, we consider the term 'atom' from the point of view of derivation, as meaning indivisible, we must admit that there is now some ambiguity about it, which, however, need not in practice be inconvenient. Each atom of uranium is not indivisible in the sense that it is an absolute smallest unit of matter, but it is the smallest unit of uranium; for when it degrades or subdivides, it ceases to be uranium and becomes something else. Thus the term atom may still, legitimately and historically, be used freely; although in the old sense, significant of ultimate indivisibility, it has now left the domain of matter and has applied itself to electricity, of which the Electron (q.v.) appears at present to be a really indivisible unit in the old sense. There are those who imagine that each atom of matter is composed of a specific grouping of such electrons or electrical units; but that hypothesis is as yet not proven.

Other hypotheses there have been—e.g. that the ultimate atom may be a vortex ring or other mode of rotational motion in the all-pervading and continuous substance known as Ether. This vortex hypothesis—identified with the name of its promulgator, Lord Kelvin—is not now supposed to apply to atoms of matter, but it may still possibly apply, in some form or other not yet elaborated, to the electrons or atoms of electricity.

One of the best-known and most reasonable modern speculations concerning the structure of an atom is one by Sir J. J. Thomson, that an atom of matter consists of a spherical mass of positive electricity with a number of electrons or units of negative electricity 'sown' in it and revolving in orbits, somewhat after the fashion of the constituent parts of a Volvox Globator (q.v.), though with a rapidity surpassingly great and subject to astronomical laws of great precision and beauty. His investigations strongly suggest that the number of electrons—or at least the number of accessible and tractable electrons—in an atom is a simple small multiple of its atomic weight.

Notwithstanding our ignorance of the structure of the atom of matter, we are fully informed as to the order of magnitude corresponding to its size—i.e. to the amount of space it effectively occupies. This is exceedingly small, far smaller than the most minute microscopic object, and accordingly

in every visible speck of matter the atoms are excessively numerous. A grain of lycopodium dust, for instance, contains many thousand million million atoms. And even the rarest substance, if reckoned by number of atoms, must be regarded as present everywhere, in almost every material, as a minute trace or impurity. The smallest drop of sea-water, for instance, contains many million atoms of gold, although a ton of sea-water contains only about the fiftieth of a grain of that substance. A summary of the arguments whereby the size of atoms is known will be found under MOLECULE.

But although atoms are so small and light (even the so-called heaviest of them) that a thousand million of them compressed together into a particle would be invisible in a microscope and would weigh far less than the thousand-millionth of a grain, yet each atom is the seat of a surprising amount of energy; and when this intra-atomic energy becomes effective, as it does occasionally in those substances which possess the property of radio-activity, a sub-atom of helium is flung off with such astounding velocity, nearly comparable with the velocity of light, that when it strikes a phosphorescent target—composed, say, of crystals of sulphide of zinc—the impact of each projectile produces a visible flash of light. In the aggregate these little flashes produce a glow visible in the dark; but very gentle magnifying power will suffice to analyse the glow into a great number of separate flashes or scintillations. A small pocket instrument, devised by Crookes, and called a Spintharoscope (q.v.), is sold to illustrate this. Every flash represents the impact of a single atom.

Although atomic explosions are astonishingly vigorous, so that we have discovered here a new source of energy, it is important to realise that its manifestations are purely spontaneous, and that there is at present no known way of stimulating them into activity; consequently this is not one of the forms of energy which at the present time are available for industrial use. An atom is occasionally the seat of an eruption, as a volcano is, but it is not subject to control.

The structure of atoms is to some extent exhibited by the nature of the light which they emit, the operation of examining the light being called Spectrum Analysis (see SPECTRUM). By subjecting the source of light to a powerful magnetic field, Zeeman showed that lines in the spectrum which had been single became multiple in many curious ways, and Lorentz has mathematically interpreted this effect as due to systematic and definite perturbation of regular orbits of electrons revolving in or round the atoms. These revolving electric charges constitute molecular electric currents, and are amenable to magnetic influence in a definite and known way, being perturbed, as a satellite is perturbed by a third attracting body, in gravitational astronomy. This fact enables a strong magnetic field applied to a source of light to furnish an intricate and instructive mode of examination when the light is analysed in a powerful spectroscope.

Although scepticism as to the existence of atoms is sometimes professed, it is impossible to deny that each form of Matter (q.v.) consists of units which if subdivided would lose the properties of that particular form of matter; and that is all that is intended by the modern use of the term. Even the electron, or atom of electricity, may in the course of discovery be subdivided, or, more likely, may be resolved into simple undifferentiated ether—though we have not the slightest inkling of any such possibility at present; and if such a process ever happens the electron's career would be terminated—that is to say, it would thereby cease to be electricity. But it is not to be supposed

that any amount of subdivision or solution or differentiation can ever cause anything real to go out of existence or cease to be, though it may become intangible and imperceptible even to our instrumentally aided senses.

Books that amplify the statements here made are the following: *Electricity and Matter* and *The Corpuscular Theory of Matter*, by Sir J. J. Thomson; *Modern Views of Matter* (a Romanes Lecture, Oxford) and *Appendix to Modern Views of Electricity*, both by Sir Oliver Lodge; and *Radio-activity*, by Professor Rutherford, Cambridge University Press.

Atomic Theory. The atomic theory furnishes a convenient working hypothesis regarding the nature of the ultimate particles of which matter is composed. It is supported by important experimental evidence, both chemical and physical, and has been of great service in the explanation of chemical facts, as well as in the progress of scientific chemistry.

Theoretical speculations as to the nature of the constitution of matter date from the earliest times of philosophy, but the gradual development of the atomic theory into its present form is owing to the accumulation of chemical and physical facts during a period of about a century. Matter has long been regarded as not being continuous, but as possessing a *grained* structure—i.e. as being made up of extremely minute particles. These particles, or groups of such particles, are supposed to be arranged in any substance at a certain average distance from one another, such average distance depending not only upon the physical state of the substance—i.e. whether solid, liquid, or gas—but also upon the temperature and pressure.

The honour of having first formulated an atomic theory based upon experimental evidence, obtained from his own investigations and from those of his predecessors and contemporaries, falls to Dalton. Prior to Dalton's first publication, early in the nineteenth century, of his contributions to the subject, a good deal of investigation had been carried on which may be regarded as preparing the way for the establishment of a rational atomic theory, although it had not been fully recognised as such at the time. It was known that in the formation of chemical compounds the constituent elements combined according to certain definite and fixed proportions. Moreover, by determining the quantities of various acids required to neutralise a given quantity of a particular base, and of various bases required to neutralise a given quantity of a particular acid, it had been ascertained that numbers could be assigned to each acid and base which represented quantities that were chemically equivalent. It was likewise known that the quantities of various metals dissolved by the same weight of an acid were capable of uniting with the same weights of oxygen. Further, it was known that several metals and other elements formed more than one compound with oxygen, the proportion of the latter being different in each. Dalton pointed out that when elements united with each other in two or more different proportions, these proportions were related to each other in a very simple way. Thus, he showed that a given weight of carbon united with a certain proportion of oxygen to form carbonic oxide, and with just twice as much to form carbonic anhydride (carbon dioxide or 'carbonic acid gas'); also that in olefiant gas and in marsh-gas the quantities of hydrogen combined with any given weight of carbon stand to each other as 1 to 2. Other examples were also known to him, notably in the case of the various compounds of oxygen and nitrogen, which showed simple relations of a similar kind. This regularity discovered by Dalton has since come to be known as the *law of multiple proportions*, and, to explain it, Dalton reverted to the atomic hypothesis, which

assumed that matter consists of atoms of different weights, those of the same element being all of the same weight.

Dalton regarded carbonic oxide as a compound of 1 atom of carbon and 1 of oxygen, and carbonic anhydride as a compound of 1 atom of carbon and 2 of oxygen; olefiant gas as a compound of 1 atom of carbon and 1 of hydrogen, and marsh-gas as a compound of 1 atom of carbon and 2 of hydrogen. He further assigned atomic weights or relative weights of the atoms, based upon the results of his own experiments, to each of the elements he had examined, assuming the atomic weight of hydrogen to be unity, since hydrogen combined with other elements in smaller proportion by weight than any other element. Although Dalton's atomic weights were far from accurate, yet his theory was sound that the observed law of multiple proportions could be satisfactorily explained by the atomic hypothesis.

Dalton further introduced a system of chemical notation, in which the atoms were represented by symbols.

Quickly following on Dalton's discoveries, was the discovery by Gay-Lussac of the simple relations of the volumes of gases which combine to form new compounds, and of the volume of the new gas produced. Thus Gay-Lussac proved that 2 volumes of hydrogen combined with 1 volume of oxygen to form 2 volumes of water vapour (all measured at the same pressure and temperature—these being, of course, such that the whole of the water formed was in the gaseous state); that 1 volume of hydrogen combined with 1 volume of chlorine to form 2 volumes of hydrochloric acid gas; and that similar simple relations existed in other cases. Gay-Lussac also noted that the numbers representing the atomic weights of elementary gases were simply related to the specific gravities of these gases. Indeed this follows directly from his law of the simple relations of gaseous volumes.

Up to this period, although attempts had been made, notably by Dalton and Berzelius, to affix atomic weights to the elements, it had not been possible to do so with much certainty. An important step, however, towards definitely fixing the atomic weights of many elements was made by the experiments and observations of Dulong and Petit. These investigators called attention to the relation between the specific heats of the elements and their atomic weights. Generalising from their experiments on a number of the elements, Dulong and Petit concluded that what are now known as the *atomic heats* of all elements (that is, their specific heats multiplied by their atomic weights) were approximately the same. This conclusion might also be stated otherwise—viz. that the capacity for heat of elementary atoms is identical. Some notable exceptions to this generalisation were subsequently found, but the *law*, as it is called, of Dulong and Petit is substantially correct. To take some examples, the specific heat of potassium multiplied by its atomic weight (1.66×39), gives as product 6.5. In the case of iron, the number is 6.3 (0.112×56), and of mercury 6.4 (0.0319×200). These numbers are very nearly constant, but all are not quite so close. Lothar Meyer states (*Moderne Theorien der Chemie*, 4th ed. p. 93) that although most atomic heats lie between 6.1 and 6.5, some are as low as 5.2 and others as high as 6.9. The fact that the atomic weights used by Dulong and Petit were different from those now commonly adopted, does not alter the general conclusions to be drawn from their observations. The constant number representing the atomic heat was, of course, different from that given above. It has not been possible to determine directly the atomic

heats of all the elements, but the atomic heats of a number have been estimated by indirect means from the molecular heats (that is, molecular weights \times specific heats) of their compounds, for it has been found to be at least approximately true that the molecular heat of a compound substance is equal to the sum of the atomic heats of the atoms which it contains. In other words, the product of molecular weight and specific heat, divided by the number of atoms in the molecule, gives a constant number.

The differences found in the atomic heats of the elements are, it will be noticed, considerable, but still it is sufficiently clear that an atomic heat determination is a most valuable assistance in fixing which of two or three numbers, each of which would sufficiently express the chemical relations of an element, should be adopted to represent its atomic weight. Other considerations have led in some cases to the fixing of a certain atomic weight for an element, but with the exception of what is known as Avogadro's Law, these need not be particularised here. Avogadro's Law is of the first importance, although its bearing was not recognised until many years after its promulgation, which precedes historically that of the law of Dulong and Petit.

Avogadro distinguished between elementary atoms, or the smallest indivisible particles of an element, and molecules, or the smallest portion of a substance, possessing all the properties of the substance. His molecules are hence groups of 2 or more atoms, each group being capable of a separate existence. Avogadro's Law is based principally upon a critical study of the facts ascertained by Gay-Lussac in his investigation of the proportions by volume in which gases combine. Avogadro held that these facts received their simplest explanation by the assumption that a given volume of any gas, whether elementary or compound, contains the same number of molecules as the same volume of any other gas when measured at the same pressure and temperature. This law is in complete accord with the dynamical theory of gases. See article GASES.

If Avogadro's Law be adopted, it follows that the relative molecular weights of gases are proportional to their relative densities, whether the gases be elementary or compound. From this we are led to the conclusion that the molecules of some elementary gases, as of compound gases, consist of 2 or more atoms. Thus 2 volumes of hydrogen unite with 1 of oxygen to form 2 volumes of water vapour. Now, if 2 volumes of hydrogen contain twice as many molecules as 1 volume of oxygen, and the resultant 2 volumes of water vapour contain as many molecules as the original 2 volumes of hydrogen, it is obvious that each molecule of oxygen must be split into 2, and that the molecule of oxygen must consist of at least 2 atoms. Again, 1 volume of hydrogen unites with 1 volume of chlorine to form 2 volumes of hydrochloric acid gas. The number of molecules at the end hence remains unchanged, but whereas each molecule then consists of hydrogen and chlorine, it is obvious that before the union the molecules must have consisted of hydrogen and hydrogen and of chlorine and chlorine respectively—i.e. each molecule of hydrogen and of chlorine must have consisted of at least 2 atoms. The molecules of a few metallic vapours consist only of single atoms. This is the case with mercury and zinc. The molecules of some non-metallic elements consist of more than 2 atoms. For instance, molecules of phosphorus and of arsenic vapours consist of 4 atoms.

The laws of Dulong and Petit, and of Avogadro, constitute the main grounds for fixing the atomic

weights as at present used by chemists. It would not be possible within the limits of such an article as this to enter into the varied evidence, derived from chemical properties of substances, for assigning particular atomic weights to certain elements. Some examples of the kind of evidence must suffice. For many years, and indeed until comparatively recently, the atomic weight of oxygen was all but universally stated as 8, compared with that of hydrogen as unity, instead of 16 as at present. Adopting this weight, the formula of water becomes HO , this being the simplest expression for the proportion (using, for the moment, round numbers instead of exact figures) of 1 part by weight of hydrogen to 8 parts by weight of oxygen. Now, we know that hydrogen and chlorine combine in the proportions by weight of 1 to 35.4 to form hydrochloric acid, and further, that not less than 35.4 parts of chlorine ever take the place of 1 part of hydrogen in combination. We further know a compound of potassium, oxygen, and hydrogen (potassium hydroxide or caustic potash), which contains these elements in the proportions by weight of 39, 16, and 1 respectively.

Marsh-gas contains carbon and hydrogen, and we know that it must contain at least 4 atoms of hydrogen, because, by suitable means, the hydrogen which it contains can be removed in four successive stages and its place taken by chlorine. In performing the first of these removals, or *replacements* as they are called, we find that 35.4 parts by weight of chlorine take the place of 1 part by weight of hydrogen. We do not know any means by which 8 parts of oxygen can be got to take the place of these 35.4 parts of chlorine, nor is there any instance known in the whole range of chemistry where 8 parts of oxygen take the place of that quantity of chlorine which combines with 1 part by weight of hydrogen.

On treating the first chlorine derivative of marsh-gas with caustic potash, we get potassium chloride, and the place of the chlorine is taken by 16 parts by weight of oxygen and 1 part by weight of hydrogen. The second chlorine derivative of marsh-gas (that in which half of the total hydrogen, or 2 atoms, is replaced by chlorine) has 2 parts by weight of hydrogen removed, and its place taken by 35.4 \times 2 parts by weight of chlorine. Corresponding to this, however, there is an oxygen compound in which 35.4 \times 2 parts of chlorine are replaced by 16 parts of oxygen. Further, the next chlorine derivative of marsh-gas has an oxygen compound corresponding to it, which, however, has the place of the 35.4 \times 3 parts of chlorine, taken by 16 \times 2 parts of oxygen and 1 part of hydrogen. Finally, the last chlorine derivative of marsh-gas has a corresponding oxygen compound in which the place of the 35.4 \times 4 parts of chlorine is taken by 16 \times 2 parts of oxygen.

It will be noticed that only in those cases where an even multiple of 35.4 parts of chlorine exists, is the place of the latter taken by oxygen alone. In the other cases chlorine is replaced by oxygen and hydrogen. Thus we see that we do not get 1 atom of oxygen, weighing 8, simply taking the place of 1 of hydrogen, weighing 1, but 16 parts by weight of oxygen take the place of 2 of hydrogen. These facts can all be easily explained by assuming the atomic weight of oxygen to be 16, when the formula for water becomes H_2O , and the other facts mentioned above may be expressed symbolically as under:

Marsh-gas has the composition CH_4 . Its first and succeeding chlorine derivatives are respectively CH_3Cl , CH_2Cl_2 , CHCl_3 , CCl_4 ; and the oxygen compounds corresponding are CH_3OH , CH_2O , CHOOH , CO_2 .

Represented by graphic formulæ, these are:

Such is an example of the nature of the very varied chemical evidence for the fixing of a particular atomic weight. Below is a list of the elements at present known with certainty, and of their atomic weights as fixed by the various kinds of evidence obtained by very numerous, and in many cases varied, experiments. The values are all referred to oxygen as standard with atomic weight 16, and are those adopted, for 1912, by the International Committee on Atomic Weights. The standard $\text{O}=16$ has been pretty generally adopted by chemists as, upon the whole, more satisfactory than $\text{H}=1$.

It has been stated in the foregoing that 1 atom of oxygen is generally regarded as combining with 2 of hydrogen to form water, and that 1 atom of chlorine combines with 1 of hydrogen to form hydrochloric acid. These are not the only variations in the number of hydrogen atoms which unite with 1 atom of another element to form a compound. Thus in ammonia we have 1 atom of nitrogen united with 3 of hydrogen; in marsh-gas, 1 of carbon united with 4 of hydrogen. Similarly, in many metallic chlorides the number of atoms of chlorine for 1 of metal varies, as, for instance, in KCl , CaCl_2 , BiCl_3 , SnCl_4 , &c. Again, the oxides corresponding to these chlorides are respectively K_2O , CaO , Bi_2O_3 , SnO_2 , &c.; while we know other compounds in which 1 atom of potassium exists in combination with 1 of bromine or iodine; 1 atom of calcium with 1 of sulphur or 2 of fluorine; 1 atom of antimony with 3 of hydrogen; or 2 of antimony with 3 of sulphur, and so forth. From these examples it will be clear that the atoms of the elements possess different *exchange values* in replacing one another in chemical compounds. This exchange value of an element is called its *valency*. 1 atom of chlorine combines with 1 of hydrogen or 1 of potassium, and these three elements are said to be *univalent*. Calcium, oxygen, and sulphur are *bivalent*; nitrogen (in ammonia at least), antimony, and bismuth, *trivalent*; carbon and tin, *quadrivalent*, &c. Some elements appear to have more than 1 valency, as, for instance, phosphorus,

which forms 2 chlorine compounds, PCl_3 and PCl_5 . Much controversy has taken place as to fixing the valency of such elements, some chemists contending that valency is invariable, and that where we find in some compounds an apparent valency less than the highest known, it is to be explained by supposing a part of the combining power to remain unsatisfied. It seems simplest to assume that the valency of an element may differ in different sets of compounds. The amount of importance attached to the valency of an element, and to the question as to whether or not the valency of an element is variable, is not now so great as it was formerly.

What is known as the *equivalent* of an element is that proportion of an element which is capable of taking the place of 1 atom of a univalent element. Thus, 39.1 parts of potassium combine with 35.46 of chlorine to form potassium chloride. The equivalent quantity of calcium is not 40.07 parts (for that quantity of calcium combines with 35.46×2 parts of chlorine) but $\frac{40.07}{2} = 20.035$ parts. 20.035 is therefore the equivalent weight of calcium. Faraday has shown that those quantities of various elements are chemically equivalent which are separated from various electrolytes by the passage through them of the same quantity of electricity. See ELECTRICITY, GALVANI.

When the elements are arranged in progressive order of their atomic weights, a certain regularity of succession of chemically analogous elements is observed. Attention was drawn to this by Newlands, and the matter was more fully developed by Lothar Meyer and especially by Mendeleëff, who formulated the *Periodic Law* which states that the properties of an element are functions of its atomic weight. The regularity of the recurrence of the cycles or periods is so striking that the appearance of gaps in the list led to the prediction, subsequently verified, of undiscovered elements (notably gallium and germanium), and of their probable physical and chemical properties.

The following table gives a list of the elements arranged according to the periodic system of Mendeleëff:

GROUPS	O.	I.	II.	III.	IV.	V.	VI.	VII.	VIII.
Series 1	H 1.008	
2	He 3.99	Li 6.94	Gl 9.1	B 11.0	C 12.00	N 14.01	O 16.00	F 19.0	
3	Ne 20.2	Na 23.00	Mg 24.32	Al 27.1	Si 28.3	P 31.04	S 32.07	Cl 35.46	
4	Ar 39.88	K 39.10	Ca 40.07	Sc 44.1	Ti 48.1	V 51.0	Cr 52.0	Mn 54.93	Fe 55.84; Ni 58.68; Co 58.97.
5	Cu 63.57	Zn 65.37	Ga 69.9	Ge 72.5	As 74.96	Se 79.2	Br 79.92	
6	Kr 82.92	Rb 85.45	Sr 87.63	Yt 89.0	Zr 90.6	Ob 98.5	Mo 96.0	Ru 101.7; Rh 102.9; Pd 106.7.
7	Ag 107.88	Cd 112.40	In 114.8	Sn 119.0	Sb 120.2	Te 127.5	I 126.92	
8	Xe 130.2	Cs 132.81	Ba 137.37	La 139.0	Ce 140.25	
9	
10	Yb 172.0	Ta 181.5	W 184.0	Os 190.9; Ir 193.1; Pt 195.2.
11	Au 197.2	Hg 200.6	Tl 204.0	Pb 207.10	Bi 208.0	
12	Ra 226.4	Th 232.4	U 238.5	

In this table each horizontal line forms a period or cycle of the elements, and the various groups arranged in columns contain elements which exhibit chemical analogies and similarities which are often very striking. The elements placed at the left of the columns possess greater resemblances to

each other than to those placed at the right, and *vice versa*. Those elements included under Group VIII. are exceptional. In each series where they occur we find a set of three elements which Mendeleëff calls *transition elements*, as they occur between the end of one and the beginning of the next

long period or term of two series. Mendeleëff's early tables contained only the groups numbered I. to VIII. After the discovery of argon and the kindred elements helium, neon, krypton, and xenon, all of which are characterised by zero valency, provision was made for these elements in Group 0.

A marked periodicity is noticed in the *atomic volumes* of the elements (that is, in the quotients of the specific gravities of the solids divided by their atomic weights) in each of Mendeleëff's series. For this subject, and the periodic law generally, see the modern text-books of chemistry, such as Mendeleëff's *Principles* (2 vols. 1905).

Atomic Weight. See ATOMIC THEORY.

Atonement, the mediation necessary for restoring the union between God and man lost by sin. The Christian doctrine of the atonement is but the explanation of its great central dogma—the embodiment in one person of the divine and human natures in perfect agreement. In the person of Christ, God and man are made at one: he is their Atonement. The various churches agree in resting the sinner's hope of salvation on the mediatorial work or atonement of Jesus Christ. Nevertheless, from the very beginning of speculative Christian theology, there have been various ways of conceiving and explaining the nature and mode of operation of this mediatorial work. 'Modern' Christianity tends to build less—or not at all—on the foundation of one historic act of substituted sacrifice; it is the life, not the death, of Jesus that feeds the faith of the 'moderns'; and for them the process of atonement demands the active co-operation of every soul here and now in reconciling and bringing into harmony the conflicting and discordant traits and tendencies which infest the inner and the outer life of man. In Judaism the law of God awakened the sense of guilt, and the desire for an atonement—a desire it could never satisfy. The Old Testament insists on atonement by vicarious Sacrifice (q.v.), but the idea of the suffering and vicarious Messiah was foreign to the Messianic faith of the great body of the people.

In the New Testament, Christ is the Mediator between God and man, having made peace through the blood of his cross; the propitiation for our sins; and our high-priest who offers himself a sacrifice to reconcile us with God. God has in Christ reconciled the world with himself. The sufferings and death of Christ were ever regarded as of primary and essential importance in his work of redemption; but we look in vain throughout the early centuries of the Christian Church for anything like a systematic development of the doctrine of the atonement. The germs of the doctrine existed, but without any logical connection or clearness. The early church fathers dwell with a sort of inspired devotion upon those facts of the gospel which represent Christ as the sacrifice for our sins, as the ransom paid for our redemption, as our deliverer from the power of Satan, as the restorer to mankind of whatever was lost by the fall of Adam; but they seldom attempt to show *how* these results connect themselves with the sufferings and death of Christ; neither do they show in what manner the atonement has objectively been made, nor how it is brought to the experience of its individual subjects. Throughout the whole earlier age of the church down to the time of Anselm, the belief was generally prevalent that Christ was offered by God, as a ransom for his people, to Satan, who held them by the power of conquest; this was specially emphasised by Origen and Irenæus. Gregory of Nyssa explained that the devil consented to receive Jesus as a ransom, because he regarded him as more than an equiva-

lent for all those under his power; but that, notwithstanding his subtlety, he was outwitted, for, owing to the humiliation in which Christ was veiled, he did not recognise him as the Son of God, and consequently was himself deceived. But having consented to receive him as a ransom for mankind, he was righteously deprived of his dominion over man, whilst he could not retain Jesus when he discovered him to be the Holy One of God. St Augustine pointed out that the devil had overstepped his power in thinking he could treat the sinless Jesus as a slave, like the other sons of Adam who belonged to him as prisoners; but he lost his right to the latter so far as they belong to Christ. The idea of a penalty endured on the part of God (as the incarnate Logos) gained the predominance after its advocacy by Athanasius. But the doctrine of the atonement was not presented in its final form until the subtle genius of Anselm reduced the confused conceptions of the early fathers to strict dogmatic definitions, and adjusted the apparent contradiction between divine love and divine justice and holiness. It is the doctrine of vicarious *satisfaction*, which, under various modifications, has ever since continued to be held as the orthodox doctrine of the church. The infinite guilt which man had contracted, by the dishonour of his sin against the infinitely great God, could be atoned for by no mere creature; only the God-man Christ Jesus could render to God the infinite satisfaction required. God only can satisfy himself. The human nature of Christ enables him to incur, the infinity of his divine nature to pay, this debt. But it was incumbent upon Christ as a man to order his life according to the law of God; the obedience of his life, therefore, was not able to render satisfaction for our guilt. But although he was under obligation to live in obedience to the law, as the Holy One he was under no obligation *to die*. Seeing, then, that he nevertheless voluntarily surrendered his infinitely precious life to the honour of God, a recompense from God became his due, and his recompense consists in the forgiveness of the sins of his brethren. In this form of the doctrine we are taught the necessity of an active vicarious satisfaction; but Anselm nowhere teaches the passive satisfaction, he nowhere says that Christ endured the punishment of men. Nor do we find in his writings the development of the subjective side of the doctrine—namely, how the satisfaction rendered to God mediates the atonement in the experience of the believer. According to Anselm, the satisfaction rendered by Christ was greater than the guilt for which he atoned; and it needed to be greater, for the payment of the debt due to God gave men no claim to the favour of God. Abelard attached principal importance to the *moral* aspect of the doctrine, and declared the love of Christ the redeeming principle, inasmuch as it calls forth love on our part. Thomas Aquinas and his followers maintained Augustine's opinion of the infinite value of the blood of Christ rendering it more than sufficient; while the Scotists maintained that it was sufficient only because God was pleased to regard it as sufficient.

Protestant theologians extended the idea of vicarious suffering, so as to make it include the divine curse, an opinion against which Bellarmine protested as 'a new unheard-of heresy,' while, on the other hand, they insisted on the active obedience of Christ, together with the passive, referring the former to the complete obedience which he yielded to the law. With the Roman Catholic theologians, the death of Jesus remits guilt contracted before baptism, and its punishment. For sins committed after baptism, it remits the repentant sinner's guilt and (for mortal sins) the eternal punishment: it remains for him to make

satisfaction by temporal punishment for all sins. They also asserted that the merits of Christ were supererogatory, while Protestants thought they were equivalent to the penalties to be inflicted upon men. Among the Protestants themselves, the Reformed Church approximated more nearly to the Scottish *acceptilatio* than did the Lutherans. According to Calvin, although the life of Christ is to be regarded as paying the price necessary for our deliverance, the Scriptures ascribe our redemption especially to his death. He says little or nothing about Christ's fulfilling the law for us, but dwells upon his delivering us from its curse. He does not, therefore, exhibit his active obedience separated from his passive obedience. And the great importance attached to his death is drawn rather from the view of its subjective necessity than from the idea of the divine righteousness. Calvin's view differs from that of the Lutheran *Concordienformel* in that he does not regard the relationship of God to man so much through the negative notion of a Redeemer from guilt and punishment, but looks upon Christ as the highest Mediator, through whom the nature of God is communicated to man. 'Modern Calvinism' represents the atonement as that satisfaction for sin which was rendered to God, in his public character as moral governor of the world, by the perfect obedience unto death of our Lord Jesus Christ. The nature of this satisfaction was a moral, not a pecuniary satisfaction. The value of the sufferings of Christ consists in their tendency to uphold the divine moral government unimpaired, whilst pardon is extended to those who have violated it. There was a moral necessity for Christ's sufferings and death—obstacles to the bestowment of pardon had to be removed—the influence of the Holy Spirit had to be secured. The whole contents of Christ's earthly existence, embracing both his active and passive obedience, must be regarded as contributing to the atonement which he made. As to the 'extent' of the atonement, a broad distinction is to be made between the *sufficiency* of the atonement and its *efficiency*. Such is the modified view of the doctrine as advocated by Dr Payne, Pye Smith, Wardlaw, and many others. The earlier form found in the writings of Owen and Edwards maintains that the atonement was made only for the elect; and that its necessity with respect to them arose out of the eternal justice of God, which required that every individual should receive his due desert.

The teaching of Socinus is a re-statement of the *Moral Influence* theory first distinctly taught by Abelard. It represents man as attaining to oneness with himself and with God by his own moral energy. It rejects that idea of the righteousness of God which makes it impossible for him to forgive sin without a satisfaction, as imposing finite limitations upon the divine Being; disapproves the doctrine of satisfaction, on the ground that satisfaction for sin and forgiveness of sin are incompatible with each other; and objects that sin and punishment are of so personal a nature as not to allow of their being transferred. The doctrine it sought to establish was that man is reconciled to God by repentance and reformation. In this purely subjective theory, repentance occupies the place of faith in the orthodox doctrine, and faith becomes identical with obedience. The sufferings of Christ were necessary in order that he might become our example, and be better fitted to render us help; that we might have a pledge and guarantee of the divine forgiveness; and as conditioning his resurrection and ascension to glory.

The Arminians endeavoured to take an intermediate position between the theory of Socinus and the satisfaction theory of Anselm. They asserted that the design of Christ was to render a sacrificial

oblation in behalf of all men indiscriminately, by which 'sufficient grace' is meritoriously secured for each, and their sins rendered remissible upon condition of faith. They maintained that the doctrine that Christ satisfies in our behalf the preceptive demands of the law by his active obedience, as well as the penal demands by his passive obedience, leads to Antinomianism.

Grotius drew a subtle distinction between *satisfactio* and *solutio*, and taught that God, by inflicting death on Christ, had given in an arbitrary way an example of punishment. His atonement theory is known as the *Governmental* theory. According to it God's justice is not vindictory, but may be referred to a general governmental rectitude based on a benevolent regard for the well-being of the subjects of his moral government. Law is a product of the divine will, and therefore relaxable. God's sovereign prerogative includes the right of pardon. God so conditions the pardon of human sinners, by selecting such an example of suffering that man may not think he can sin with impunity. Christ's sufferings, then, were not punishment, but an example of a determination to punish hereafter. They were not to satisfy divine justice, but to impress the mind of the moral universe with a sin-detering motive. This view is substantially the same as that held by the younger Edwards in America. After Grotius, Limborch emphasised the idea of a sacrifice, as set forth in the Old Testament, which the theologians previous to Anselm had generally adopted. This theory was introduced into the Arminian works on theology, and approved by the Socinians of the next period. The Quakers admitted that redemption has once been made by the death of Christ, but connected with it the idea of a second redemption realised internally. This second reconciliation they regarded as the essential redeeming principle.

According to what is often called the *Mystical* theory, the reconciliation effected by Christ was brought about by the mysterious union of God and man, accomplished by the incarnation, rather than by his sacrificial death. This view was not confined to the Platonising fathers or the disciples of Scotus Erigena, but was held by Osiander and Schwenkfeld at the Reformation, and by the school of Schleiermacher, the most spiritual among modern theologians. The last connected the doctrine of the vicarious sufferings and perfect obedience of Christ with his sinlessness and the doctrine of his priestly office, but separated the substitution and the satisfaction so as to represent Christ's sufferings as only vicarious, but not as making satisfaction; and his obedience as making satisfaction, but not as vicarious. The redeeming and atoning principle is not the single fact that Christ died, but a vital union with him. By means of this we appropriate to ourselves Christ's righteousness (his obedience unto death); this appropriation, however, is not to be confounded with the mere external theory of vicarious satisfaction. Christ's passive obedience is merely the crown of his active obedience.

The following are the statements of three modern representative English theologians: (1) J. J. Tayler, as representing the view of modern Unitarianism, which has followed naturally from the 'moral influence' theory of Socinus and earlier of Abelard; (2) Dr J. McLeod Campbell, whose 'sympathy theory' was a spiritual outgrowth from Calvinism; (3) F. D. Maurice, the representative of the modern 'Broad Church' School, which approximates to the 'moral influence' theory. A fourth characteristic view is outlined in the article RITSCHL.

(1) Dr Tayler says: There is *one* mediator between God and men, the man Christ Jesus. This can only refer to unrivalled pre-eminence, not to

exclusive function. For all higher minds do, in fact, mediate between their less gifted fellow-creatures and the great realities of the invisible world. This 'one' is a *human* mediator, 'the mar Christ Jesus'—not a being from another sphere, an angel or a God—but a brother from the bosom of our own human family. 'He gave himself a ransom for all' who embrace his offers and will hearken to his voice. He brings from God a general summons to repent; and with that he conveys, through faith, a spiritual power to shake off the bondage of sin, and put on the freedom of a new heart and a new life. He is a deliverer from the power of sin and the fear of death. This is the *end* of His mediation. This is the redemption of which he paid the price. His death, cheerfully met in the inevitable sequence of faithful duty, was only one among many links in the chain of instrumentalities by which that deliverance was effected. It was a proof, such as could be given in no other way, of trust in God and immortality, of fidelity to duty, and of love for mankind. In those who earnestly contemplated it, and saw all that it implied, it awoke a tender response of gratitude and confidence, which softened the obdurate heart, and opened it to serious impressions and the quickening influences of a religious spirit.

(2) Dr John McLeod Campbell says: The work of the Son of God who came to do and did the will of his Father must, in view of the deliverance which he wrought, be regarded as twofold: first, as dealing with man on behalf of God, and second, as dealing with God on behalf of man. In dealing with man on behalf of God, Christ revealed to us the Father in his relation to a sinful world, showed us what our sins were to God, vindicated in the world the Father's name, and witnessed to the excellency of that will against which we were rebelling. In thus revealing the will of the Father towards sinful men, he necessarily became a man of sorrow and suffering, but these arose naturally out of what he was, and the relation in which he stood to those for whom he suffered; and to the holiness and love of his very nature must we refer their awful intensity and immeasurable amount. He suffered what he suffered just through seeing sin and sinners with God's eyes, and feeling in reference to them with God's heart. By what he suffered, he condemned sin, and revealed the wrath of God against it. His holiness and love taking the form of suffering, compose the very essence and adequacy of his sacrifice for sin.
